FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Indexes to this report (by keyword, author, personal names, title and series) are available from Bell & Howell, Old Mansfield Road, Wooster, Ohio 44691.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

NATIONAL POLICY AND ISSUES

BEIJING PROPAGANDA DEPARTMENT HOLDS FORUM ON ECONOMIC THEORY

HK241452 Beijing City Service in Mandarin 2300 GMT 17 Nov 80

[Text] According to a BEIJING RIBAO report, the propaganda department of the Beijing Municipal CCP Committee recently held a forum on economic theory. Some 80 people attended the forum, including theorists, responsible personnel of enterprises and cadres of the bureaus concerned. Focusing on the four proposals of the central secretariat for the work principles of Beijing Municipality, the forum discussed the municipality's problem of reforming the economic and political systems. During the forum, the participants emphatically discussed problems in implementing the central secretariat's four proposals for Beijing Municipality's work principles. All participants held: in order to implement the central secretariat's four proposals, we must correct our ideological line. Reviewing the past situation, they said: during the reign of the gang of four, Beijing Municipality suffered seriously. After the smashing of the gang of four, major leaders of the Beijing Municipal CCP Committee clamped down the lid for 2 years and did nothing. Even at the time of the smashing of the gang of four, many kinds of work remained unchanged. After the third plenary session, Beijing Municipality lagged behind where the criterion of truth was concerned. Since the central secretariat put forward the four proposals, Beijing Municipality has lacked specific and effective measures to promote political and ideological construction, beautification of the environment, scientific and cultural construction and economic construction which meets the demands of the capital. The housing problem has been acute and some people have suffered while others have been satisfied. The authorities have been unable to find solutions to food, clothing and transportation problems. In addition to this, some other problems have begun to grow. It will be difficult for us to solve these problems unless we correct our ideological lines now, face the masses and proceed from the actual conditions to formulate necessary measures and improve our work styles.

The forum also carried out serious discussions on reform and readjustment of the economic and political systems in Beijing Municipality. All participants unanimously held: It is absolutely necessary to readjust and reform the economic system of Beijing Municipality. If we do not carry out readjustments, Beijing Municipality will never meet the demands of the four modernizations nor will it advance. However, the participants held diverging points of view regarding how to carry out readjustment and reform. Some comrades advocated vigorus readjustments and reform and some advocated mild ones, fearing that vigorous readjustments would end up in a mess. Regarding the political system, many comrades held that reform was also necessary on the whole, and that the orientation was correct. However, some comrades thought that conditions were not yet ripe. Other comrades reflected that some leading cadres did not have a clear understanding regarding reform of the political system, saying: What are the flaws of the original system of CCP committees: capitalist countries demand money and socialist countries demand power. If there is no power, how can the party lead us?

The meeting held: It is normal for diverging opinions on readjustment and reform of the economic and political systems to exist. Our party already possesses the correct political and ideological lines, and we can obtain unanimous opinion through upholding the principle of seeking truth from facts, emancipating our minds, launching investigations, studies and equal discussions. The meeting also held: We must fully motivate the activism of all people in the municipality. Currently, a problem that needs immediate action is to adopt decisive measures to prevent some leading cadres from promoting privilege seeking by means of their position of power.

In conclusion, many participants at the forum proposed that major responsible comrades of the municipal CCP committee and the municipal government and comrades in charge of theory work attend this kind of important meeting from now on to listen to the opinions of experts and comrades engaging in practical work. This not only improves their own standard of theory, but also help them formulate policies and principles.

MORE ENTERPRISES TO GET DECISIONMAKING AUTONOMY

Hangzhou ZHEJIANG RIBAO in Chinese 29 Oct 80 p 1

[Article: "On Increasing Decisionmaking Power of Enterprises"]

[Text] In his report on the work session of the Provincial Party Committee, Comrade Tie Ying [6993 3841], first secretary of the Provincial Party Committee, said: "We will go all out next year, on the basis of the summations of our key experiments, to extend decisionmaking power to all state-operated enterprises in the province, so as to allow them even more autonomy in personnel administration, finance, material resources, supply, production and marketing. At the same time, more enterprises of different kinds will be selected to experiment with independent accounting, state taxation, and responsibility of enterprises for their own gains and losses."

He pointed out that the extension of the decisionmaking power of enterprises is a vital link in the reorganization of economic administration. An all-out extension of the decisionmaking power of enterprises directly involves those sectors in charge of finance, commerce, foreign trade, material resources, commodity prices, banking, labor, and personnel. This means that we must do a good job of our ideological and organizational work in order to reach a consensus and take concerted action to implement the reorganization of the system of economic administration. As a relatively independent economic unit engaged in commodity production, every enterprise, once given extended decisionmaking power, will feel motivated to develop its production. Party committees, governments, and economic departments at all levels will have to raise their understanding and strengthen their leadership. The responsible comrades of governments at and above the county level should take overall command to bring about a reorganization of the system of economic administration geared to the extended decisionmaking power of enterprises. The leading economic organs at all levels must work closely and assume responsibility to improve their own work and modify their workstyle in order to redirect their priority to "service, coordination, overall planning, and supervision." To insure unobstructed implementation of the program, they must study new developments, solve new problems, sum up new experiences, and modify any of their own rules and systems that are incompatible with the program to extend the decisionmaking power of enterprises.

As directed by the Party Central Committee and the State Council, Comrade Tie Ying said the enterprises should be given more decisionmaking power to plan production handle funds, procure material supplies, market products, adjust prices, hire qualified workers, and hire and fire employees. The question now is how to put this into practice. Due to contradictions between extended decisionmaking power and existing regulations, some units which had experimented with extended decisionmaking power are still denied the rights accorded them by the State Council and the provincial people's government. We have to work a practical solution to this problem. If these regulations in question were issued by the provincial, regional, municipal, or county government, they should be amended to accommodate the extension of the decisionmaking power of the enterprises.

He said the experiments with independent accounting, taxation by the state, and responsibility of enterprises for their own gains and losses should be actively pursued. The enterprises selected for the experiments should be representative of those paying more tax than the profit they earn, those earning more profit than the tax they pay, those paying very little tax and earning very little profit, and those earning a rapidly increasing amount of profit. This variety provides opportunities for comparison and new experiences to sustain the systematic execution of the program.

Comrade Tie Ying said the decisionmaking power of educational, scientific research, and commercial units should also be extended. Various localities have begun since last year to select some of these units to carry out this experiment. Now it is time to sum up experiences and expand the scope of the experiment.

The extended decisionmaking power of enterprises should be accompanied by democratic management, because socialist enterprises are run by their staff and workers. This means not only letting managerial and technical personnel have both authority and responsibility commensurate with their positions, but also letting the staff and workers have the authority to manage the enterprises. Every enterprise should form a strong congress of representatives of staff and workers or a congress of staff and workers as a vehicle to carry out political, economic, and production democracy and to extend the power of the staff and workers to manage the enterprise and supervise its cadres. Guided by rules laid down by the party and state, it deliberates and decides on production and business programs, production plans, commodity supply and marketing, and matters relating to labor, wages and welfare. It decides on the discharge of staff and workers and has the authority to elect and recommend the appointment and removal of the leading administrative personnel of the unit. A factory director is the administrative leader of an enterprise who is responsible for its production and business management. He reports periodically to the congress on his work and accepts its scrutiny and supervision. He has to have the consent and cooperation of the workers' union in day-to-day matters concerning the personal interests of the staff and workers. Once a congress of representatives of staff and workers or congress of staff and workers is organized, the establishment and composition of its permanent organs will be worked out by trial and error as the system functions in practice.

Comrade Tie Ying said the reorganization of the commercial system must follow closely the extension of the decisionmaking power of enterprises, because the existing commercial system is full of flaws. While adhering to the principle of combining planned market adjustments and adjustments by market forces, the latter must be brought into full play under the guidance of state plans, in order to build a diversified economy with less compartmented multichannel circulation of commodities. The following are the major areas awaiting immediate reform: First, rigid control of the procurement and marketing of merchandise must be restructured and broken down into four different vehicles of management, according to the availability of the means of production in relation to their supply and demand in the national economy. These vehicles should include centralized procurement and sale, planned placement of orders for goods, preferred orders for goods, and free procurement and sales. Second, the problem of too many checkpoints in merchandise circulation must be resolved. Under the existing commercial system, merchandise circulation and management are structured according to administrative divisions. That is to say, "Each level of government administration is matched by a corresponding level of wholesale service and each checkpoint entails an additional item of expenditure." The circulation of commodities must be organized according to economic regions, so as to allow interregional procurements and sales. Third, there must be more channels of circulation to encourage the production sectors to take up circulation operations and to help collectively owned enterprises and individual retailers do business, so as to activate the circulation of commodities through state-operated, collective, and individual channels.

PRC STATE ECONOMIC COMMISSION TO STRESS RESULTS

OW121240 Beijing XINHUA Domestic Service in Chinese 1405 GMT 11 Dec 80

[Text] Beijing, 11 Dec (XINHUA)--In arranging for the production work of the industrial and communication front in the first quarter of 1981, the responsibile person of the state economic commission laid stress on enhancing economic results in industrial and communication production next year.

This responsible person made this remark at the production management meeting held by his commission on 9 December. He said that in economic work next year, the principle of laying stress on readjustment must be resolutely implemented. Therefore, in arranging for the production work for the first quarter next year, it is necessary to consolidate enterprises and do a real good job in readjustment; to selectively expand the production of products of good quality, great demand and lost cost and consumption; and to close, suspend, merge or transform those enterprises whose products can hardly find markets and are of poor quality, high cost and high consumption and which have been running at a loss for a long time.

Production should be so arranged as to meet the needs of the society. Products in good demand but short supply must be increased. Energy, building materials and communications and transport industries must be steadily developed and in particular, the light industry must be developed at a greater pace. Economic planning and guidance and administrative control over the macroeconomy must be strengthened so that repetitive production projects and blind expansion of production capability are put under strict control.

This responsible person dwelled emphatically on light industry. He urged that light industry must make great efforts to improve its product quality, increase variety, and produce more products of high and medium quality so as to still better meet the people's need, increase revenue and stabilize the market. Great efforts should be made to ensure light industry and of its needed fuel, power and raw materials.

To well arrange the production work of industry and communication in the first quarter of 1981, said this responsible person, it is necessary to strengthen the leadership and the political-ideological work. All departments and localities must send cadres to basic-level units to help solve problems arising in the course of production work. The state economic commission also has to send cadres of work on the spot to take effective measures to implement the industrial and communications production tasks for the first quarter of 1981.

CSO: 4006

DEADLINE FOR ECONOMIC READJUSTMENT EXTENDED

HK050324 Hong Kong WEN WEI PO in Chinese 5 Dec 80 p 3

["Random Talk on the News" column by Lin Wei: "Further Extension of the Deadline for Economic Readjustment"]

[Text] The 2d session of the 5th NPC in May 1979 put forward a plan for readjusting the national economy, which prepared to complete this task in 3 years. At the beginning of this year, the then Vice Premier Deng Xiaoping said when receiving foreign guests that the readjustment might be extended 1 year, thus lasting 4 years.

However, it seems now that this plan has been changed yet again and that the deadline for completing the readjustment has again been extended. The RENMIN RIBAO editorial of 2 December, entitled "Resolutely Implement the Principle of Readjustment in an All-Round Way" pointed out: "It now appears that the task of readjustment cannot be completed in 3 years but will take longer than that. By doing the foundation work in a thoroughgoing way, standing firm, and being filled with vitality, we will be able to advance with strong steps in future. In this way, it may appear on the surface as though our speed has slowed down, but in fact the economic results will be much better."

It can be said that this RENMIN RIBAO editorial marks a major turning-point in China's future national economic development. People could judge that this was a weighty pronouncement simply from the way it was presented. In recent years most RENMIN RIBAO editorials have been carried partly on the front page and partly on an inside page, but the editorial in question not only took up about three-fifths of the entire front page, where it was carried in full, but its title also appeared in the large type that has been seldom used for editorial titles in recent years.

This editorial is obviously important. It has at least revealed that the readjustment is extended, and that itself is a major news item.

Why is the readjustment being extended?

One thing is that in the past 1 year and more of readjustment work a number of new problems have been encountered, such as the decline in grain production due to serious natural disasters; imbalance has developed between energy exploitation and reserves, output cannot be guaranteed, finances have gotten into the red, and so on and so forth.

Another thing is that cadres at all levels on the industrial front have not done well in implementing readjustment. Some of them are apprehensive and wavering, and some even openly or secretly resist readjustment. The result is that capital construction projects that should be halted are not and projects that should not be started are.

The writer has already pointed out in these columns that readjustment of capital construction cannot just be carried out by relying on people's awareness; it is simultaneously necessary to wield the axe in a big way and apply administrative measures. In the course of the State Council's handling of the Beijing Dongfang Chemical Plant, people have seen the central authorities' resolve to force a halt to projects that were forcibly started despite criticism. Today, in the RENMIN RIBAO editorial, people see still more clearly the attitude of the Beijing authorities: "Apart from adopting various effective economic measures in readjusting the national economy, it is also necessary to carry out the necessary administrative intervention."

The extension of the deadline for economic readjustment has been caused by objective circumstances. Although the extension of readjustment means that speed will slow down a bit, if the foundation is firmly laid, things may be done slower today but they will be done faster tomorrow.

CSO: 4006

PRC ECONOMIC JOURNAL ON RESPONSIBILITY FOR OUTPUT QUOTAS

HK290616 Beijing JINGJI YANJIU in Chinese No 10, 20 Oct 80 pp 38-42

[Article by Zhou Cheng (0719 6134), specialists on agricultural economy at the Chinese People's College: "Discussion on the System of Responsibility for Output Quotas by Production Teams in Rural People's Communes"]

[Text] During the 10 chaotic years, Lin Biao and the gang of four advocated the ultraleftist line and under the banner of the so-called "putting politics in command" they negated socialist business management. All the management systems and methods that have been proven effective by rural people's communes for a long period were branded as "capitalism" and "revisionism" which caused unfathomable damage. Following the downfall of the gang of four, some of the systems and methods such as recording workpoints based on fixed norms, "To know 1 year in advance" and the system "of responsibility for output quotas" have been reintroduced and have been developing again in the people's communes. Over the past 2 years, the people's communes in various places throughout the country have accumulated rich experiences in practicing the "system of reponsibility for output quotas" (the system of responsibility for agricultural output quotas with labor pay calculated on the basis of the ouput; it is also called the "system of responsibility related to output"). Yet there are still some problems and this article is intended to study some of them theoretically.

I. The System of Responsibility for Output Quotas Has Long Beer Practiced With Apparent Benefit to our Agricultural Collective Economy [subhead in boldface]

Before we study this question, it is imperative to review the history of the system of responsibility for output quotas in our agricultural collective economy.

The system of responsibility for output quotas that is being gradually introduced in many people's communes and production brigades and teams is not new. In fact, it first emerged in the period of elementary agricultural producers cooperatives. It gained the attention of the party and the government and was widely used during the whole period of agricultural cooperatives.

As early as 16 December 1953, the party Central Committee pointed out in its "Resolution on Developing Agricultural Producers Cooperatives": "Some cooperatives that are experimenting with the system of yearly responsibility for plowing and output quotas may be helped, if such help is welcomed by the masses, to constantly sum up their experiences so that such labor organizations can be gradually perfected." On 31 July 1955, the party Central Committee suggested in its "Resolution on the Questions of Agricultural Cooperatives": "On the basis of the system of seasonal and yearly responsibility for jobs, the system of award for those who overfulfill output quotas must be introduced. Those who overfulfill their output quotas must be awarded while those who fail to do so must have their labor pay deducted." On 9 November 1955, the Standing Committee of the National People's Congress passed the "Draft of Exemplary Regulations for Agricultural Producers Cooperatives" and pointed out that "Agricultural producers cooperatives must strive to introduce a system of plowing by stages and seasonal responsibility for jobs (small scale responsibility) so as to gradually introduce yearly responsibility for jobs (big scale responsibility) When the system of yearly responsibility is implemented, the system of award for overfulfillment of output quotas must be introduced." On 30 June 1956, it was defined by the National People's Congress when it passed the "Draft of Exemplary Regulations for Higher Stage Agricultural Producers Cooperatives" that "agricultural producers cooperatives may introduce the system of award for overfulfillment of the responsibility for output quotas." In its "Directives for Doing a Good Job of the Production Management of Agricultural Cooperatives," (14 September 1957) the party Central Committee further pointed out that "the systems of responsibility for work, output quotas and finance must be popularized." It has been proven that during the whole period of agricultural producers cooperatives, the party and government both paid attention to and advocated the system of responsibility for output quotas. The wise use of the system for responsibility for work, output quotas and finance and the practice of awards during the period of agricultural cooperatives helped us to gain rich experiences. In his book "The Socialist Upsurge in China's Rural Areas" Comrade Mao Zedong included two articles on experience in implementing the "system of responsibility for work and output quotas" and other articles on experience in implementing the "system of responsibility for finance." A number of other articles and pamphlets about the system of responsibility for output quotas were also published. Even now when we read these articles, they remain fresh to us because in carrying out such a system today we encounter the same problems that appeared when the system was first introduced.

The "System of Responsibility for Output Quotas" was abolished in 1958, the early period of the establishment of the people's communes that was characterized by the tendency to affect the transition of communism prematurely and the tendency of pursuing things large in size and collective in nature. The system of "three-level ownership by the people's commune, the production brigade and the production team with the production team as the basic accounting unit" was introduced in 1962. At that time, the system of responsibility for work, output quotas and finance and the system of award should have been introduced and popularized. Unfortunately they were only restored in animal husbandry and sidelines production. It was true that such systems were also restored in farm production, but the extent of the reintroduction of the system of responsibility for output quotas was even far below that of during the early period of agricultural cooperatives. During the chaos that lasted for 10 years, Lin Biao and the gang of four carried out the ultraleftist line and the system of responsibility for output quotas was once again abolished. But even when the "four pests" were rampant, a few units covertly restored the system of responsibility for work, output quotas and finance and the system of award in large-scale farm production.

The 3d Plenary Session of the 11th Party Central Committee pointed out: "Under the premise of distribution and unified accounting by production teams, work teams may be assigned the responsibility for work, with labor pay based on output quotas and award given for overfulfillment of the quotas." Following this instruction, the system of responsibility for output quotas has been used by more and more units in large-scale farm production and it has been welcomed by the broad masses of commune members. The implementation of the system of responsibility for output quotas in our agricultural collective economy proves that a scientific, practical and efficient management system has strong vitality. It will stubbornly open up its own road and it cannot be abolished at will.

The system of responsibility for output quotas has not only been practiced in our country for a long period, it has only recently been used in other socialist countries. For example, the cooperative farms in Korea have operation teams (equal to production teams in our country) that manage operation groups and basic labor units. The operation teams place responsibility on operation groups for "fixed work and output quotas with award given for overfulfillment of quotas." The agricultural producers' cooperatives in Romania give "additional award" to the production teams that meet yearly production plans.

As a management system, the system of responsibility for output quotas is beneficial to improving production and reducing production costs. Reference materials about the use of this system in the period of agricultural cooperatives and over the recent years proved that the implementation of the system helped increase farm products by 10, 30 or even 50 percent. On the other hand, production costs generally dropped by 10, 30 and 40 percent.

II. Implementing the System of Responsibility for Output Quotas Is in Line With Implementing the Principle of "Distribution According to Work" in Agricultural Production [subhead in boldface]

The reason that the system of responsibility for output quotas has vitality is that it aids in better implementing the principle of "distribution according to work" in agricultural production.

In carrying out the principle of "distribution according to work," the rural people's communes and production teams have demanded that all labor pay for commune members accord with their work. Therefore, they first demanded that peasants' labor pay (workpoints) in daily production accords with the amount and the quality of their daily work. It is thus necessary to use a certain form of labor pay and the form that has gradually come into use is that of workpoints based on piecework. But in agricultural production, daily work is hard to evaluate in regard to time needed to produce the final results of labor--agricultural products. In addition, the quality and quantity of agricultural production are not as specific and explicit as those in industry. It is also more difficult to check the quality of agricultural operation, therefore if the labor pay for commune members is merely decided by the fulfillment of their daily work, it is often difficult to make labor pay accord with the work done. Whether the work done by commune members is completed in time with the quality and quantity meeting the demand can only be measured by crop output. That is to say, it is more accurate to measure their daily work (including the quality and quantity) by the fruit of their labor--output of agricultural products.

Therefore in carrying out agricultural production it is necessary to "link output with labor pay" so as to enable labor pay to accord with the work done. That is to say, labor pay for commune members' daily work may be readjusted (added or deducted) according to the output situation; or that "labor pay may be directly based on output" ("To pay according to output"). Such is the essence of the system of "responsibility for work and output quotas." It is also the main point and core of the system of responsibility for output quotas. The nature of the system of "linking output with labor pay" is similar to the piecework wage system in industry. The practice of the system of "linking output with labor pay" will enable commune members, operation units, individuals and small collective units to be concerned, from the point of their material interests, with the quantity and quality of their work as well as the output of crops. In such a situation, the problem of checking the quantity and quality of work can thus be solved. It also will help solve the problem of "pursuing higher workpoints with disregard for high output" and encourage operation units to take measures to deal with changes within natural conditions and crops' growth so as to attain higher output. It will be more complete if the "responsibility for finance" is added to the system of "responsiblity for work and output quotas." Because with this complete system both commune members and the units that are responsible for output quotas will strive to increase output and reduce costs in order to increase both output and their income. Therefore, the system of "responsibility for finance" must be regarded as an important part of the system of "responsibility for output quotas."

In carrying out the system of responsibility for output quotas, the output of crops is the criterion to measure labor consumption. Therefore, it is very important to fix output quotas properly because by doing so the actual output can readily and correctly reflect labor consumption. If the quotas are fixed too high or too low, they would be easily or hardly reached. Under such a situation, the output cannot correctly reflect labor consumption and it can not be used as a means for awarding or punishing. This situation does not accord with the principle of "distribution according to work." In fact we gained such experience during the period of agricultural cooperatives. "The directive of the party Central Committee on doing a good job in production management of the agricultural cooperatives" (14 September 1957) pointed out: "Under the conditions that production teams have actively overfulfilled their production plan, the target for the responsibility for output quotas must be fixed below the planned quotas so that the production teams will be able to overfulfill their quotas and to get deductions so as to encourage the initiative and creativeness of commune members." This directive also stipulated the principle of "more award, less punishment." It has also stipulated how, when natural disasters occur, to readjust the fixed output quotas and how to carry out awarding and punishing rationally. All this is of practical significance even today. In carrying out the system of responsibility for output quotas, some places calculate crops' output according to their value or calculate net income by deducting production costs from output value. Experience has proved that so long as output quotas and the quotas for net income are fixed rationally, the above calculating methods still can reflect labor consumption rather correctly. In fact to replace output quotas or output value quotas with net income quotas is to include the system of responsibility for finance ("responsibility for costs" or "responsibility for production expenses") in the system of responsibility for work and output quotas. Thus with quotas concentratedly reflected, it is easier to see the advantages of these systems.

Some comrades have doubts about the system of responsibility for output quotas and one of the main reasons for them is that they still cling to equalitarianism. They hold that in carrying out this system, some people will be awarded while some others will be punished, thus the income gap among commune members in a basic accounting unit will be broadened and cause polarization. In fact, so long as we correctly formulate and carry out the system of responsibility for output quotas and the standard for awarding and punishing, the difference of labor pay among commune members will meet the demand of "labor pay in accord with the work done," therefore the difference is correct. Such difference is in fact the difference of richness in carrying out the principle of "distribution according to work," and it has nothing to do with "polarization." On the contrary, it is only when the system of the responsibility for output quotas is carried out can we effectively overcome equalitarianism that exists in distribution in rural people's communes and production brigades. Only by so doing will we be able to make labor pay more correctly accord with the work done and carry out still better the socialist principle of "distribution according to work." Therefore, in addition to those that are engaged in planting agricultural crops, all other departments of forestry, animal husbandry, sideline production and fisheries, agricultural production units under collective ownership and state farms and enterprises must also carry out such a system. In fact, the state farms are carrying out various systems of responsibility for output quotas and award that are similar to those carried out by rural people's communes.

III. The System of Responsibility for Output Quotas Meets the Need of the People's Communes and Production Brigades and Teams in Organizing Labor [subhead in boldface]

The reason that the system of responsibility for output quotas has vitality is that it meets the need of strengthening the work of organizing labor within the production teams.

An specialized mass production needs a complete method for organizing labor. The rural people's communes and production teams are agricultural enterprises with a certain scale of production. They have certain amounts of laborers, land, animals and tools. In order to carry out production smoothly, agricultural units must be set up according to the features of various departments and various types of work so that division of labor and coordination can be carried out in an orderly manner within the spheres of different spaces and times. Such measure is very important in coordinating the mutual relations of people in the process of production and in coordinating the work of organizing labor.

In addition, the people's communes and production teams themselves have to form the system of responsibility for production. Lenin said that people must understand their "responsibility for carrying out certain tasks and actual work." ("Collected Works of Lenin," "Draft Regulations on the Management Work of the Soviet Organs," vol 28, p 329) The system of responsibility is closer to what Lenin said about carrying out the responsibility for output quotas than that for actual work and meets the demand that "a certain people are totally responsible for the work they are to manage." ("Collected Works of Lenin," "Note to (A.I. Yelijalova) [1344 9122 0673 0448 2089 5012 1216]" vol 36, p 554) Because by so doing, the responsibility for actual work can be implemented through the system of responsibility for output quotas while the economic activities for the material interests of the operation units can be strengthened so that these units can actively display their role as "combat groups" within the production teams. For people's communes, production brigades and production teams, to establish labor organizations is complementary to establishing a rigid system of responsibility for production quotas because such organizations are in the interest of carrying out the system of responsibility for production quotas. A rigid system of responsibility for production quotas is beneficial to promoting and consolidating labor organizations. Thus to carry out the system for responsibility for output quota is an important measure for people's communes and production brigades and teams in promoting and developing labor organizations by dialectically combining the system and the organizations.

Generally speaking, the size of an operation unit is determined by whether or not it can independently carry out most of the operations on a large area of land from preparing the land right to harvesting. In this way, the unit will be concerned with the output of the crops and will be responsible for the fulfillment of output quotas. But concretely speaking, the size is determined by the conditions of producton and productivity of the production teams themselves, the size of their fields that are linked together, the number of production departments, the acreage for crops and the level of mechanized production. Marx said that "the composition and division of labor is decided by the number of farm tools owned." ("Selected Works of Marx and Engles," "Poverty of Philosophy," vol 1, p 127) In general, the production teams without farm machinery or with a low level mechanized farming are characterized by inefficient farm tools, small-scale labor division and coordination, highly dispersed production, a small amount of land and small-scale operation teams. On the other hand, the production teams with a quite high level of mechanized farming are characterized by tractor stations (teams) that are responsible for most field work, while the main job of production teams is to do complementary job or field management odd jobs. In this situation, the output of the crops is not closely related with the field work of the operation teams. Some state farms with high mechanization have placed the system of responsibility for output quotas on their production teams that have tractors. But generally speaking, it is more proper for the people's communes to place the responsibility for production quotas on operation teams (or specialized teams).

Some comrades uphold that since operation teams are small in size, production teams will lose their superiority of collective labor, division of labor and coordination if they make operation teams as the units responsible for output quotas. Therefore, they have regarded the measure as a "step backward" in production relations in the rural people's communes.

In discussing this problem, we must proceed from the actual conditions of the productivity of our agricultural collective economy. From a long-term point of view, there exists a tendency in our agricultural economy of blindly pursuing what are "large in size and collective in nature." The role of the production teams is often reiterated with regard to organizing labor within the production teams, as if the superiority of their collective labor, the division of labor and coordination can only be displayed only when everything is unifiedly readjusted by the production teams themselves that act as operation units. Such a measure is no doubt wrong. The size of the current production teams is decided by the productivity in rural areas and there exist the relations of the division of labor and coordination among them. Within the production teams, the operation teams constitute an entity of labor organization that is divided into operation teams that divide the labor but on a coordinated basis. Therefore such operation teams will help production teams fully display their superiority of mass production. Due to the division of specialization and groups, these teams will also help develop the superiority of mass production.

IV. Correctly Handle the Economic Relations Between Production Teams and Operation Teams To Display Fully Their Functions and Roles [subhead in boldface]

If the production teams place the responsibility for output quotas on operation teams, the economic relations between them must be correctly handled so as to meet the demand in carrying out the principle of "distribution according to work" and in rationally organizing labor. But these relations are in fact the concrete production relations within the production teams themselves. To correctly handle these relations means to do a good job of the economic management system within the production teams, fully bring into play the function and role of both the production teams and operation teams and promote the whole collective economy of the production teams without changing the basic system of the rural socialist collective economy.

But before the relations between the production and operation teams are correctly handled, we must first clearly designate the nature and features of both production teams and operation teams. As basic accounting units, the production teams are in fact agricultural enterprises with independent accounting that assume sole responsibility for both their own profits and losses. The operation teams are units within the production teams with a relatively independent nature. They are an organic part of the production teams. Thus according to their nature and features, the economic relations of the operation teams with the production teams are in fact the relations between the principal and the subordinate. Therefore the principle for correctly handling relations between them is: "Big unity and small dispersion" and "unity but flexible and dispersion in an orderly manner" so as to meet the demand of "unified leadership and management by various levels." "Big unity" and "unity but flexible" meant that as an enterprise, a production team must carry out unified leadership and management over the economic activity through the production team; but this measure must in no way obstruct the production and economic activities of the operation teams. "Small dispersion" and "dispersion in an orderly manner" mean that under the unified leadership and management of the production teams, the operation teams display their initiative to fulfill various tasks but must in no way become "teams among teams" by doing things in their own way or even actually becoming basic accounting units.

The basis for the economic relations between the production teams and the operation teams are economic rights, economic obligations, economic responsibilities and economic interests. As basic accounting units, the production teams mainly manifest their functions and roles by carrying out the necessary unified leadership and management over the whole production teams and over the operation teams. For example, the production teams unifiedly formulate and implement production plans, unifiedly use big and medium size means of production and, if necessary, unifiedly adjust the assignment of laborers in coordination, unifiedly calculate profits and losses and distribute income. These are the so-called "unifications." Generally speaking, such unifications are indispensable for production teams to maintain their position as basic accounting units. Under such a premise, it is necessary to define the economic rights, obligations, responsibilities and interests of the operation teams so as to enable them to carry out the system of responsibility for output quotas. For example, these rights, obligations, responsibilities and interests must include "fixing duty"--define the acreage to be plowed by the operation teams and crops' output quotas (the so-called defining output quotas that should be fulfilled); "fixing staff" (labor power)--define the number of laborers to be basically used by the operation units for 1 year's production tasks; "fixing the number of animals and tools"--define the number of the animals and medium and small farm tools that are to be used by the operation teams (whether the animals and tools are to be fixedly used by the operation teams depend on the scale of the work and the number of the animals owned by the production teams); "Fixing expenses" (defining costs or "responsibility for finance")--"Placing financial responsibility" on operation teams for production expenses for a whole year; "fixing the number of [illegible] laborers used" ("responsibility for work")--define total workpoints that are to be arranged by the operation teams. In general, the operation teams are not in a position to "retain surplus laborers or to ask for additional laborers when there is a shortage of laborers,""fixing awards and punishment"--according to the overfulfillment or underfulfillment of the responsibility for production quotas, the original total workpoints of the operation teams will be proportionately added (awarded) or deducted (punished) to finally determine their total labor workpoints that are to be unifiedly distributed by the production teams.

All the "unifications" and "fixings" mentioned above will closely link the economic relations between the production teams and the operation teams. These systems will ensure the position, function and role of the production teams as basic accounting units to the benefit of their operation teams in carrying out the system of the responsibility for output quotas. These systems will also combine organizational management by the production teams with the flexibility of the operation teams in carrying out production independently so that both the production teams and the operation teams can fully bring into play their functions and roles to develop agricultural production.

ECONOMIC PLANNING

RELATIONSHIP BETWEEN PRODUCTION, CONSUMPTION ANALYZED

Beijing JINGJI KEXUE [ECONOMIC SCIENCE] in Chinese No 3, 20 Aug 80 pp 13-17, 7

[Article by Zhou Wanjun [0719 8001 6874] Anhui Institute of Finance: "Several Questions on the Relationship Between Production and Consumption"]

[Text] The question of the consumption by laborers has not been discussed thoroughly for a long time. Both from the standpoint of theory and from that of summing up our understanding of the lessons of practical experience, there are marked weak links which are quite out of accord with the requirements of socialist modernization.

This article covers some academic views on the question of the consumption by laborers, analyzing and probing them simply for the instruction of comrades in academic circles.

The first question: Did Marx pose the problem as follows: "Production is manifested as the starting point, consumption as the end point, and distribution and exchange as intermediate links?". In journals and documents, this quotation is often cited as evidence of Marx' positive view. An example of this is the article "Consumption and Production" by Comrade Kuang Haolin [0400 3185 2651] appearing in the "Economics" section of GUANGMING RIBAO on 28 April 1979.[1]

Comrade Kuang Haolin correctly cites Marx' viewpoint in the introduction to "A Critique of Political Economy" that production, distribution, exchange and consumption are various links in an overall whole, that they are distinctions within a unified corpus. But Comrade Kuang follows this by citing "production is manifested as the starting point, consumption as the end point, and distribution and exchange as intermediate links" as Marx' viewpoint, and on this basis expounds upon the determining action of production and the reaction of consumption and other links to production.

The spirit of the original work precludes us from considering this quotation as a proposition by Marx. In fact, it is a narrative criticism by

Marx of the viewpoints of bourgeois economists on this question. This superficial viewpoint of the bourgeois economists was based on a superficial idea of economic activity. It is this that Marx took as an object of criticism when he scientifically expounded his own thinking on the mutual relationships between production, exchange, distribution and consumption and exposed and criticized the philistine component of the others. Simply put, the argument is as follows:

First, at the beginning of the same paragraph as the cited quotation, Marx correctly points out, "Their superficial idea is. . . that production is manifested as the starting point, consumption as the end point, and distribution and exchange as intermediate links. . ."[2]

Second, in the paragraph preceding this quotation, the opening paragraph in the chapter, Marx points out, "Before further analyzing production, we must investigate the following several items which economists juxtapose with production."[3] Of course, the economists referred to here are neither Marx himself nor Marxist economists, but bourgeois economists. This is followed by Marx further narrating and criticizing the superficial relationships indicated by the bourgeois economists in juxtaposing items such as distribution, exchange and consumption with production. As brought out in the narrative criticism or critical narrative, speaking of starting points and end points is a way of generalizing the superficial ideas held by the bourgeois economists.

Third, in his analysis of this superficial idea, Marx further revealed how the bourgeois economists took this to form "a standard three-stage exposition, with production being general, distribution and exchange being particular and consumption being individual, with the whole thing being joined together. Of course this is a kind of relationship, but it is a kind of superficial relationship."[4]

We should say that the foreword of the second chapter of the introduction to the "Critique on Political Economy," that is, the portion we have quoted above, consists entirely of a criticism of the idealist, metaphysical viewpoint of bourgeois economists in separating, juxtaposing or treating as equal production, distribution, exchange and consumption. It serves as a contrast to the positive exposition by Marx. Reading between the lines clearly shows Marx' critical attitude.

To be concrete about the relationship between production and consumption, the main point stressed by Marx is that production and consumption must be understood as an active process. When they are treated as an active process, Marx stressed that consumption is an internal factor in productive activity. First, consumption not only enables products to become the ultimate act of products, but it also lets producers become the ultimate act of producers. Products become an active principal target. If no one consumes them, their existence has no meaning. Second, the actual consumption of products creates new needs and conceptually raises the targets of production. This not only leads anew to production, but it also becomes an internal driving force for the development of production. Third, through the reproduction of labor power realized by the laborers through individual consumption, that which is for the sake of a product creates the main body for that which is for production. This is a basic condition for social reproduction to be carried out continuously.

Marx' analysis fundamentally destroyed the superficial view of the bourgeois economists that "the products in consumption depart from social activity" and that they are the "end point." In addition, at the same time that Marx profoundly revealed the direct identity between production and consumption, he also lucidly analyzed the opposition of the two, pointing out, "The direct unity of combining production with consumption and consumption with production does not exclude their direct opposition."[5] Thus we can see that Marx analyzed the relationship between production and consumption as a unified corpus with active contradictions.

When we compare Marx' analysis with the beginning point-end point arguments and three-stage exposition methods of the bourgeois economists, we can see radiating here the illumination of materialist dialectics. Marx' theories treasure most highly the most outstanding cultural legacies of mankind while being good at throwing away the fake and retaining the genuine harbored therein and thereby absorbing the useful intellectual results. When another school, of bourgeois economists, treated distribution as an independent realm to be juxtaposed to production and raised their arguments about beginning and end points, Marx again, using his unique insight, affirmed views such as the one that production is the beginning point and how many saw their relationships on the surface and perceived the importance of production and paid serious attention to the scientific component of production. He pointed out sharply that this is was "nothing but the most philistine reproach" and that this kind of reproach "stands on the same base as, or even below that of" those reproached.[6] He thereby dealt head-on blows to the most philistine of them. But as analyzed above, we definitely cannot take these analytical affirmations and treat the above quotation as a proposition of Marx. I am afraid that the error in understanding of Comrade Kuang Haolin also is of this nature. The danger is that in denying that consumption is an internal factor and condition in the production process which influences many aspects of the development of production from within the process itself, the problem of consumption will be excluded from economics.

The second question: "No direct connection can be established between capitalist production and consumption. . . [but] since socialist production has eradicated the antagonism between social production and social consumption inherent in capitalism, production and consumption are linked together." Does this viewpoint correspond to the reality of economic motion?

This idea was raised by three comrades, including Tian Jianghai [3944 3068 3189]. (In the article "To Not Heed the People's Livelihood Is to Betray Socialism," appearing in the "Political Economy" section No 30 of GUANGMING RIBAO, 19 Dec 1977.) I think this idea is open to question. It is directly related to how to evaluate correctly the problem of the position and role of consumption in the economic motion of society.

First, there is a concrete epistemic problem in the form of the above viewpoint of Comrade Tian Jianghai et al. They aver that the goal of capitalist production is not the consumption of the masses of the people but the profits of the capitalists. How then can the masses' consumption be linked directly with capitalist production carried out for profit? Let us take a look at the actual conditions of the movement of a capitalist economy and at Marx' analysis of this problem!

Indeed, the sole purpose and absolute motive that capitalists have for engaging in production is to obtain profits. The consumption of workers is essential to the capitalists only within the limits of guaranteeing that they obtain profits. Only if they can create surplus value for the capitalists will workers be permitted to do labor or consume and thereby exist. Except for this, the consumption of workers disappears from the field of vision of the capitalists. Can we draw the conclusion from this that no direct link is established between the consumption of hired workers and capitalist production? Seen superficially, the consumption of a worker is a private, individual matter and has no relationship to capitalist production. In reality, the reproduction of labor power realized by a worker's consumption is an important condition for the maintaining of the capitalists' continuing exploitation of the workers. This belongs to the reproduction of the capitalist relations of production, that is, it is an important element in the capitalist relations of production. Without it, the capitalist relations of production and thereby capitalist reproduction would lose its base of wage labor. It is better to say that the holding of workers' consumption to the level of the reproduction of labor power is precisely one of the basic conditions for capitalist production, an internal direct determinant of capitalist production. At the same time, workers' consumption also enables products to achieve a final completion. But these products are not general products but those which include surplus value. So workers' consumption enables surplus value to be realized. From this we can see that the consumption by workers is directly linked to capitalist production in two regards; it allows surplus value production to continue and it enables surplus value to be realized. Therefore, workers' consumption is subordinate to capital. Without the consumption of wage labor and other people, there would be no production of capitalist surplus value. Therefore the viewpoint that no direct link can be established between capitalist production and consumption does not accord with reality. Nor does it accord with the basic principles of Marxist political economy.

Second, Comrade Tian Jianghai et al. said that due to the antagonistic nature of capitalist production and consumption, the two cannot be linked directly with each other; and that since socialism has eradicated this antagonism, a direct link between production and consumption has been established. This viewpoint is also unacceptable. The antagonism between production and consumption under capitalism does not nor can it negate the direct link between production and consumption. All it does is vest this linkage with a specific class nature and explain the opposition of the fundamental interests of the two. This kind of antagonism is a condition which occurs in a direct linkage. If the two aspects of an antagonistic contradiction had no direct link, what kind of contradiction could form? What opposition would there be to speak of? If the two were not directly linked, the contradiction between the unlimited expansion of production and the relative restriction in the demands of those with the capability to make payments could not become a direct cause of capitalist economic crises. There would be no way to comprehend the conclusion that "the most fundamental cause of all genuine crises is always the poverty of the masses and their limited consumption."

The establishment of a socialist ownership system has eradicated the antagonism between production and consumption, but contradictions still exist. Links without contradictions are static and cannot change or impel each other. The viewpoint that under socialism there are only direct links without contradictions between production and consumption does not correspond to reality and is a one-sidedness produced under the new conditions.

Third, the error produced by the authors also lies in treating the role of capitalist consumption in obstructing the development of production as a cause and manifestation of being without direct links, and in treating the role of socialist consumption in promoting the development of production as a cause and manifestation of direct links. The article clearly claims that under socialism "the direct link between production and consumption impels the rapid development of the forces of production. Indeed, this is one prominent manifestation of the superiority of the socialist system over the capitalist system." Actually, the mutual relationship between production and consumption, by which I mean their mutual interaction, serves to promote as well as obstruct. Both aspects are generated in the direct linkage. The superiority of the socialist system over the capitalist system does not lie in establishing a direct link between production and consumption but rather in the nonantagonistic nature of this link. The economic crises which appear under capitalism damaging production are not caused by the lack of establishing a direct link between production and consumption but by the class antagonism in this direct link. The basic source of the role of consumption in promoting production is the direct link between the two. Basically speaking, to exclude the role of consumption in obstructing production from consideration of a direct link remains a kind of thinking which denies that the relationship between production and consumption is a contradiction.

At the same time, we cannot say that the contradiction between production and consumption only plays a destructive role in capitalist production. As noted above, it is a condition necessary to the existence and development of the capitalist mode of production. Although this kind of development is realized in cyclical destruction, it is a precondition for the exploitation of the laborers and the enormous waste of socialist labor. The programs proposed by the capitalists and their representatives to resolve the contradiction between production and consumption, fundamentally speaking, sharpen it and intensify it. But for a certain period, we cannot say that these things do not serve any role in developing production. A precondition for the genesis of this role is precisely the internal relationships of the contradiction itself. Under socialism, the relationships between production and consumption, by which I mean their objective economic conditions and economic benefits, cannot of course produce the same kind of destructive consequences as in capitalist society. But because the contradiction still exists, if people cannot correctly understand it and control it in appropriate ways, then these contradictory relationships can intensify. This is especially so when mistakes in line are produced, as when Lin Biao and the "gang of four" ran amok, sabotaging production and repressing consumption. We cannot deny that this is an important factor which has repeatedly brought the national economy to the brink of collapse. The superiority of socialism lies not in there being a direct link without contradictions between production and consumption, but in the change in the nature of this contradiction. We are relatively more able to analyze correctly this contradiction and handle it according to changes in objective conditions and the demands of economic laws.

The third question: "The problem of consumption is essentially a market problem." Does this correctly summarize China's historical experience or clarify the nature and position of consumption under socialist conditions?

This viewpoint was raised by Comrade Kuang Haolin in the same article in his analysis of China's First Five Year Plan period. I think this formulation is also open to question.

First, the consumption which the author speaks of in summarizing the historical experience of China's First Five Year Plan is clearly a matter of consumption under socialist conditions. More concretely, it is a question of the consumption of the masses under socialism. We know that when we speak of the modes of daily consumption of the masses, we can separate them analytically into individual consumption with the household as the basic unit and collective welfare. Both kinds of consumption satisfy the constantly increasing needs by the masses for material and cultural livelihood. They both are demands in the interest of the masses. Because of this the nature of the problem of consumption under a socialist system is a problem of the goals of production determined by the nature of public ownership of the means of production, and it is a problem of actualizing the interests of the masses of the people. If we do not recognize this soberly, we cannot fundamentally pay serious attention to consumption. We will produce for the sake of production, either consciously or unconsciously, and have fast growth for the sake of fast growth, and even set up public ownership for the sake of public ownership.

Second, the market is a sum total of exchange relationships between commodity producers. When the commodity economy occupies a dominant position, the materials replacement and value compensation demanded by commodity production are all carried out through exchange on the market for these purposes. The market is conditioned by the relationship between demand and supply and further conditioned by the relationship between production and consumption. To sum up the consumption of the socialist masses in a nutshell as essentially a market problem not only fails to deepen our understanding of the problem but, on the contrary, makes it into a superficial phenomenon of economic life.

Of course, a socialist market is necessary and important for the daily consumption of the masses. The vast majority of individual consumption goods are obtained through a market. The products, composition and even the mode of consumption can be reflected in market relationships. Moreover, we can affect the consumption levels of laborers with fixed incomes through changes in market prices and in modes of buying and selling. The market is an important link in promoting and limiting consumption and production. But it is not the essence of consumption. Rather than saying that a socialist market satisfies the needs of the urban and rural people, we should say that it is mainly a means of satisfying the needs of the peasants.

At the same time, a portion of the means of consumption of socialist laborers is supplied the laborers' consumption in the form of collective welfare. Examples include culture and education, hygiene and health, labor insurance, services and social relief. It is a supplemental mode for distributing socialist consumption goods. Charges are levied on some of them, while others are gratis. Some go through a market, while some basically have no connection with a market. To sum up this portion of consumption which has no relationship with a market as also being a market problem is very hard to comprehend. Rather we should say that it does not involve a direct relationship with the market, and that this is a characteristic of socialist collective welfare and collective consumption.

China's First Five Year Plan was carried to success relatively smoothly and the people were relatively satisfied. Of course, as far as the relationship between production and consumption is concerned, one cause for this was that market relationships were relatively lively and there were relatively many kinds of modes of buying and selling; but this was not the main, basic experience. The key here is to heed relatively seriously the demands of objective laws and to pay attention to the actual interests of the laborers. When arranging our plans, we must first guarantee that the livelihood of the people can gradually be raised in keeping with the development of production. That is to say, in normal years, the portion of national income used in consumption must be guaranteed within the plan period. Taking into account the growth in population, the per capita consumption level is to grow year-by-year, with the remaining forces then arranged for accumulation. In this way we carry out capital construction investment which is beneficial to the growth in consumption. The realization of the consumption interests of socialist laborers has turned into an enormous motive force for the development of production. This is the secret of the success of the First Five Year Plan.

The fourth question: "The rate of growth of production falls behind that of the purchasing power of the people." Is this a regular phenomenon of the motion of a socialist economy? This viewpoint, that with the increase in the people's standard of living under a socialist system, the insufficiency in commodity supply shows the superiority of the socialist system over the capitalist system, because there is no overproduction crisis in the economy, is still expressed even after the smashing of the "gang of four," and appears in the recently published book, "The Socialist Transformation of Capitalist Industry and Commerce in China." This book asserts that "the growth in social purchasing power again exceeded the rate of growth in these consumption goods. This is a relatively long-term phenomenon in the course of the building of socialism." (People's Press, 1978, p 170) If we are fettered by this kind of theoretical viewpoint, we become used to the insufficiency of commodity supply and do not expend any effort to resolve the problem.

Fundamentally speaking, insufficiency of commodity supply is a question of the goals of socialist production and of the comprehensive balance in the national economy. For example, during the First Five Year Plan, accumulation constituted 24.2 percent of the national income and consumption, 75.8 percent. In the distribution of accumulation funds, construction of a productive nature constituted 71.7 percent and that for livelihood, 28.3 percent, of which housing construction occupied 9.1 percent. Funds within industry were distributed in a ratio of 1:8 between light and heavy industry. The gross value of industrial output increased by 18 percent per year, with that of light industry increasing 12.8 percent per annum. The gross value of agricultural output increased by 4.5 percent per annum. The average annual wage of staff and workers throughout China increased by 42.8 percent between 1952 and 1957, while peasant income increased by 27.9 percent. The retail turnover of social commodities grew by 14.6 percent per annum. Although some commodities were insufficient, basically the commodities during that period matched the social purchasing power. In addition, prices were stable. The masses were relatively satisfied. That is to say, provided there is a long political situation of stability and unity where the main efforts are concentrated on carrying out production and construction and the goals of production are defined according to the requirements of economic laws and, on the basis of increases in the national income, overall consideration is given to the people's livelihood and comprehensive balancing is carried out conscientiously, then we can basically put an end to the insufficiency in commodity supply.

For the past ten or more years, the supply of industrial goods for daily use has become increasingly tight. This was mainly caused by the ultra-left line of Lin Biao and the gang of four which sabotaged production, repressed consumption and pursued excessively high rates of accumulation. Because of the dislocations which arose and the consequent irrationality in economic structure, it will take a period of time before all this can be fundamentally reversed. But, if everyone in China from top to bottom works together to cultivate doing things according to the fundamental economic laws of socialism, proceeds from the requirements for satisfying and improving the people's livelihood, concentrates his main efforts to carry out agriculture, adopts exceptional measures, firmly resolves to promote light industry, firmly resolves to shorten the line of capital construction and strives to raise the effectiveness of investment, all in order to carry out the readjustment of the economy and travel the path of promoting light industry with agriculture, supporting heavy industry with light industry and supporting the slow with the fast, then we can bring the national economy onto the track of long-term, balanced and high-speed development. The experience of history tells us that whenever the economy has encountered difficulties, when we use the method of lowering the rate of accumulation and increasing consumption, we overcame our difficulties smoothly and tided over the crisis. But we did not draw from this that it was a lesson of experience which necessarily bore with it the nature of a law. We always looked upon it as a temporary measure. In fact, it reflects a law of development of the socialist economy. It is an inherent stipulation of public ownership of the means of production that it thoroughly guarantee the welfare of the people. If we proceed from this to carry out readjustment and direct production, we can cause the national economy to develop rapidly.

Some people feel that the consumption needs of the people are changeable and limitless, and that it is impossible to satisfy these needs continuously. This is mixed up. The consumption needs that we are talking about are not baseless subjective needs but those which match the actual purchasing power. Only this kind of consumption needs can actually affect market supply and demand. Relatively accurate data on the actual purchasing power can be obtained through investigation and research in various channels. If we were to carry out this sort of investigative analysis of purchasing power conscientiously, we could discover that although consumption needs are changeable, over certain periods they are also relatively stable. Under China's conditions, the growth in purchasing power is always linked together with the development of production. The growth in the purchasing power of the peasants is conditioned mainly on increases in the production of agricultural and sideline products. The growth in the purchasing power of workers has as its only source the increase in income distributed according to one's work, and this is conditioned on the increase in products created by the labor of the workers and on increases in the quality of these products. Therefore it is basically possible to supply commodities to match this purchasing power. It is normal for the supply to be tight for a while for new products created out of new materials or using new industrial processes which have good consumption properties and whose price level is in keeping with the purchasing power of the people. It is precisely this kind of need backed by purchasing power which causes new products to appear and develop and compels old products to hasten to be upgraded or replaced. Thus, on the basis of promoting the development of production we also cause consumption needs to be satisfied correspondingly.

History and the positive and negative aspects of real life tell us that an insufficiency of commodity supply under socialism is a penalty for not doing things according to economic laws. The fallacy in the above "theoretical viewpoint" lies in its taking the dislocation caused by violating the requirements of objective economic laws as a fixed starting point and then use this as a basis for generalizing it into a theoretical definition used for directing production. To act repeatedly in accordance with this forms a vicious circle which causes supply to become tighter day by day, the varieties of ration coupons to increase daily and the shopping lines to become longer each day. Then the problem of commodity supply becomes ever more difficult to solve. Obviously, a view which takes penalty and destruction as superiority and which treats subjective concoction as objective law must be exposed and criticized or we cannot bring into play the superiority of the socialist system, fundamentally resolve the contradiction between production and marketing, achieve a balance between the supply of goods and materials and market purchasing power and guarantee the maximum possible satisfaction of the material and cultural livelihood needs of the people.

There is a tremendous danger in an insufficiency in commodity supply which limits the development of production by suppressing people's demands and thereby negates the nature and goals of socialist production. The acceptance of socialism by the working classes cannot be done simply through theoretical education. It must also be done through realizing their own personal interests and from this joining theory and practice. Only then will they struggle for the cause of socialism with firm resolve. If economic work departs from working for the well-being of the people, it will lose its socialist nature. Thus, basically speaking, the harm created by insufficiency in commodity supply is that it causes ownership by the people to become divorced from all its interests and to become a hollow and ungraspable thing, impeding good circulation in the national economy and blocking the road to socialist development.

PREREQUISITES FOR INCREASED INDUSTRIAL DEVELOPMENT

HAngzhou ZHEJIANG RIBAO in Chinese 31 Oct 80 p 1

[Article: "Zhejiang's 1981 Industrial Production Development"]

[Text] What are the guiding principles for the development of industrial production in our province in 1981? This is the question your reporter put to the Provincial Economic Council. A responsible comrade of the council said: Due to our effort over the past couple of years to carry out in industry and communications the state policy to readjust, reform, reorganize, and improve the national economy, production has developed both in speed and in volume as we have liberated our thinking and liberalized our policy to help reactivate adjustments by market forces. To enhance the healthy development of industrial production and insure its sustained growth, we must focus our attention on more efficient business management, better quality and greater variety of merchandise, reduction of waste, higher economic efficiency, and prevention of indiscriminate pursuit of output value per se. Special emphasis must be placed on production safety, labor protection, and balanced production. We must work for speedy readjustment and reform of the economic system, speedy exploitation of potentials and renovation, speedy conservation of energy and raw materials, and speedy improvement of the level of management so as to achieve the maximum economic efficiency with the minimum consumption of materials. Thus, we have to do well in the following four areas.:

1. We must handle well the relationship between production and safety. The leadership at all levels of provincial industrial and communications systems must adhere to the proposition that production must be safe and insure safety in production. All industrial and communications enterprises should give priority to production safety and see that it takes root as a principle, a system, and an organization. There must be universal, sound, safety systems and regulations that are strictly observed by staff and workers. Production safety should be an important measure for rating the work of every enterprise, every workshop, every team, and every individual worker.

2. We must handle well the relationship between the development of production and energy conservation. The most baffling problem confronting our province's industrial production is the shortage of energy. Since the state is unlikely to achieve a sizable increase in energy production, we must be prepared to conserve energy on a long-term basis in our development of production and strengthen the management of energy resources and the work of energy conservation. As the saying goes: "A meal

saved by the rich is a poor man's food for a year"; energy conservation must begin with the big consumers. Every enterprise should control its energy resources like it controls its food ration. Even so, what even the most successful energy-conserving unit can do is but "to scratch the surface." There is still much more to be done in energy conservation.

3. We must handle well the relationship between the full utilization of existing facilities and the acquisition of new productive capabilities. Now, many plants are blindly copied. If this is not satisfactorily corrected, both old and new plants will be unable to function well. Before we can readjust the old plants, new ones will need readjustment. Therefore, in order to achieve a sustained increase in industrial production, we must organize various joint economic entities based on specialization, cooperation, and sound economic principles so as to enhance the competitiveness of industrial products.

4. We must handle well the relationship between work so as to reinforce the foundation and development of production. We should extend to enterprises the decision-making power in management so as to sustain the enthusiasm of the staff and the worker masses. Instead of fanfare and obsessions with quotas and high yields, we must get to the basics to evolve a system of strict responsibilities, strengthen our ideological political work, and raise the level of technology and business management so as to provide industrial production with a firm foundation.

GUANGDONG ECONOMIC PLAN SHOWS GOOD INITIAL RESULTS

Nine -Month Figures

Guangzhou NANFANG RIBAO in Chinese 19 Oct 80 p 1

[Article by Li Sensheng [2621 2773 4141]: "Aggressively Increasing Income and Saving Expenditures In Order To Speed up Accumulation of Capital; Guangdong's Economic Plan Fulfillment for First 9 Months Is Good"

[Text] This year has been the first since implementation of the new financial system was approved by the Party Central Committee, and fulfillment of financial income and expenditures for the first 9 months of this year went very well. Financial income reached 80.23 percent of the plan for the year--an increase of 8.08 percent compared with the same period last year. Financial expenditures reached 66.68 percent of the plan for this year--a decrease of 5.31 percent compared with the same period last year. Income has increased while expenditures have dropped. Income was greater than expenditures, so there was a slight gain. This result was accomplished by the combined efforts of the vast majority of cadres and workers who participated in the movement to increase production while cutting expenditures, conscientiously executing the policy concerning readjustment, reform, reorganization, and improvement.

During the first 9 months of this year, the provincewide gross industrial product increased 10.6 percent compared with the same period last year. Of this, light industrial products increased 16.85 percent, contributing significantly to the increase in financial income. Such a rapid progress in financial income provincewide has not been paralleled in recent years. Among the 23 areas and cities, there were 9 which completed more than 80 percent of the plan for this year; Shenquan and Zhuhai had completed the plan for the whole year one quarter ahead of time, with a surplus. There were 15 prefectures and municipalities whose financial income surpassed that of the same period last year. Those which achieved more than a 10-percent increase included Guangzhou, Shenquan, Zhuhai, Shaoguan, Foshan, Jiangmen, Zhanjiang, and Meizhou--eight cities, plus Shaoguan Prefecture.

Since the beginning of this year, various industrial and commercial enterprises all over the province have continuously reformed their economic administrative system. They have gone one step further to develop the experimental work for expanding the right of enterprises to autonomy, and thus have expanded their experiences and achieved a rather good economic effect. As a result, the profits delivered to the government by the various industrial and commercial enterprises have increased significantly. During the first 9 months of this year, the profits delivered to the government by the local state-operated industrial enterprises and commercial enterprises, together with the consumer cooperative systems, have increased more than 20 percent compared with the same period last year.

This year the government has generally implemented a financial administrative system whereby "each administrative unit and each business unit will manage its own budgeting, keep the surplus, and keep the benefits of increased production as an incentive." This policy has successfully mobilized every level of administrative and business unit to organize income, save expenditures, and increase the effectiveness of its capital utilization. As a result, significant savings in public and conference expenditures has been achieved in many areas.

The concerned department considers that, generally speaking, the financial income and expenditure [record] during the first 9 months of this year have been good. However, we must recognize that there are still many more factors that can affect income, such as expenditures incurred from raising the wages of a portion of the cadres and workers, which will be reflected in the figures for the fourth quarter. The provincewide plan for industrial enterprises to reduce their production costs has not been achieved; the plan to turn losses into gains has not reached its goal; and a small number of units are still violating financial economic regulations. Therefore, in order to be able to fulfill, and to fulfill with surpluses, the plan for financial income and expenditures this year, every unit must continue to work cooperatively, digging up the latent potential by all means and all methods, and forcefully carry out measures for organizing income and saving expenditures.

Report From Hong Kong

Hong Kong WEN WEI PO in Chinese 22 Oct 80 p 1

[Article: "Maintaining a Steady and Uniform Development, Guangdong's Industrial Output Increased More Than 10 Percent; Growth Rate of Light Industrial Collective Enterprises Surpassed That of People-Owned Enterprises"]

[Text] Industrial production in Guangdong has maintained a large-scale, steady, and uniform trend of growth this year. Cumulatively over the first 9 months of this year, the gross industrial product increased 10.6 percent over the same period last year.

So far this year, in carrying out the policy of "readjustment, reform, reorganization, and improvement," Guangdong has emphasized the development of superior [quality], the protection of competition, the opening wide of opportunities for production and consumption, the development of production, and increased income. As a result, a greater scale of increase has been achieved by light industry and collectively owned industry, which are more sensitive to market adjustments. The gross product of light industry increased 12.8 percent compared with the same period last year, while the gross product of collectively owned industry increased a whopping 22.3 percent--far exceeding the level achieved by heavy industry and industry owned by the whole people, which are more heavily adjusted by the plan.

In the key districts and cities where industries are concentrated, such as the Guangzhou and Foshan areas, the growth rate surpassed the average level provincewide. The major products were found to have fulfilled the plan better. Some products have already achieved planned goals for the whole year.

According to statistics compiled over the first 9 months of this year, 80 percent of the 80 major products have already fulfilled the plan goals for the whole year. There are 26 products, including steel materials, various colored metals, tungsten steel, tung oil, oil shale, iron ore, caustic soda, soda soap [5142 8565], light bulbs, everyday glassware, leather products, washing machines (household), electric fans, refrigerating equipment, elevators, and wattmeters, which have fulfilled planned goals for the whole year 3 months ahead of time. Popular industrial products which are in short supply scored significant increases not only in the number of brands but also in the quantity of the products.

ECONOMIC PLANNING

DEVELOPMENT OF SPECIAL ECONOMIC ZONES IN GUANGDONG SUPPORTED

Guangzhou NANFANG RIBAO in Chinese 18 Oct 80 p 3

[Article by Li Yanshi [2621 6056 1395]: "To Successfully Build Special Economic Zones, Emphasis Must Be Placed on the Word 'Special'; Another Discussion on the Building of Guangdong Special Economic Zones"]

[Text] The "Regulations on Guangdong Special Economic Zones" have summarized the policies and measures related to the establishment of the special zones. In order to build special economic zones successfully, we must, according to the spirit of the "regulations," implement a series of special policies and ingenious measures which are different from those applied to other areas. That is to say, that, in directing the construction of these special economic zones, we must start out with the characteristics of the special zones. In other words, we must place emphasis on the word "special."

So-called special economic zones, as is obvious from the name, are economic zones where special policies and special administrative measures are implemented during the course of our economic construction. They are built mainly by attracting foreign firms and their capital. The foreign businesses and enterprises are completely administered and operated independently by the foreign firms. Foreign firms which are willing to come and invest in the special zones are given the necessary conditions, a certain favored treatment and various conveniences. This kind of special economic zone is not only closely related to the socialist economy but also to the world's capitalist economy. Its development is ruled by its own special laws. In order to operate special economic zones well, we must respect the special laws regulating the construction of the special zones. We must never go against these laws. What is important at this juncture is the fact that we must liberate our thinking, daring to face reality, and acting accordingly. What we need to do in order to be able to liberate our thinking is to break our old habits and frame of mind which hinder the establishment of the special economic zones. In carrying out our task or pondering over problems, we must not act according to our own subjective desires or the profit of our own department or unit alone, but we must also take into consideration the profit of the investor. In other words, we must destroy our old economic administrative system and establish a new economic administrative system which will meet the needs of the special economic zones. Only by doing so can we create the necessary conditions for the establishment of the special economic zones and promote their development.

We must point out, however, that the economic administrative system which was founded over the past 30 years of socialist economic construction possesses numerous shortcomings and fraudulences which are detrimental to the development of the construction work related to socialist modernization, so it must be reformed. This country is experimenting on this matter right now. This economic system is even more unsuitable from the viewpoint of establishing special economic zones. We must firmly insist on the destruction of this system. At present, some comrades still lack an understanding of the characteristics of special economic zones. As a result, they don't respect the laws governing the establishment of the special economic zones. Instead of creating conditions favorable to the implementation of the special policy and administrative measures for the special economic zones, they carry on as usual according to the old rule, ignoring the characteristics of the special economic zones completely; or worse, they apply various restrictions, citing this "instruction" or that "regulation" of the past. No wonder a situation described by one comrade as "foot chains on the ankles, handcuffs on the wrists, and a noose around the neck" can take place in matters related to the construction of special economic zones. Unless this kind of situation is changed immediately, the "regulations" cannot be implemented effectively and the progress of establishing special economic zones will be adversely affected.

Some comrades have suggested that implementing a special policy and ingenious measures for the construction of special economic zones constitutes "special treatment" and so is "improper." This statement is only partially correct. If no special laws related to special economic zones are respected, if no special policy and no ingenious measures are implemented, and if no special road and methods for the construction of the special economic zones are recognized, can special zones remain special? If one says that this constitutes "special treatment," he is right. But this is not "improper," because it has to be done this way. There is no other way by which a special economic zone can be built.

Implementing a special policy during the construction of special zones is based fundamentally on the principle of "equality and mutual benefit." This principle is the principle applied in general in international economic activities. Practicing this principle in economic activities means taking care to benefit both sides at the same time. Only by doing so can economic cooperation develop smoothly. Otherwise, economic cooperation, no matter what the format may be, cannot materialize, nor can it endure. We, the socialist nations, must also practice this same principle when we conduct our international economic activities. Construction of special economic zones is no exception. The fact that the "regulations" state clearly that foreign firms which invest and bring in businesses and enterprises shall enjoy certain specific favored conditions is nothing but a concrete manifestation of the principle of "equality and mutual benefit." We must steadfastly carry out this principle. We must realize that those who cooperate with us economically come from different places. The willingness of foreign firms to come and invest in the special zones is, first of all, an expression of friendship toward our country which is beneficial to our socialist economic construction. To be sure, the benefits of both sides must be taken care of at the same time. In a capitalist society, everything is for profit, and profit is the law which governs every activity of capital. Therefore, we cannot ignore this principle when we carry out economic cooperation with foreign firms.

Some are worried that we might get the worst of it when we give so many favored conditions to foreign firms. This worry is quite unfounded. The "regulations" state clearly that foreign firms shall be given a broad field in which to operate, good conditions in which to operate, and safe and stable places in which to conduct their businesses. They shall receive favored treatment on matters related to the use of land, foreign exchange, management, and taxes. They shall be assisted in every way possible in matters related to the importation of materials and the entry and departure of their personnel. These are some of the necessary conditions for foreign firms to come and invest and build plants in the special zones. It also constitutes the embodiment of the principle of "mutual benefit." If these conditions and the necessary favors and conveniences are not bestowed, it will be impossible to attract foreign firms to come forward and invest. Then there will be no special zones to talk about, and where will we get our benefit? Some of the favorable conditions appear to be quite ingenious; however, they are necessary in order to speed up the building of the special economic zones. For example, the "regulations" state clearly that the income tax rate is to be 15 percent for special zone enterprises. It also states that those enterprises which are organized within 2 years after the announcement of this rule, or those enterprises whose investment exceeds 5 million, or those high-technology enterprises whose capital circulation cycle is longer, or those enterprises which reinvest their profits in the special zones for more than 5 years, shall be given special consideration and their income tax will be reduced or even exempted, according to the circumstances. These special favors bestowed upon those enterprises which invested early, which are large in scale, or which are advanced in technology so that their capital circulation cycle is longer, and on those which reinvest in the special zones, will no doubt help those enterprises make more profit. On the other hand, these [favors] will also benefit us by attracting more foreign capital and higher technology more rapidly, thus promoting development of the special zones. This, in reality, also takes care of the benefits of both sides at the same time. During the early stages of the economic construction of Russia, Lenin pointed out that as long as we are able to get foreign production materials such as machinery and electric equipment as soon as possible, as long as we are able to get the help of powerful and advanced capitalists, "we do not mind giving several tens of millions of our materials and wealth to them as 'tributary gifts'." He also said: "As long as we are able to improve our workers' lives, we do not care if they make a profit of 150 percent." ("Complete Works of Lenin," Vol 32, pp 213, 299) If one calls this a concession, then it is an "equal value concession." (Ibid., Vol 33, p 295) Therefore, bestowing favorable conditions on foreign firms does not necessarily mean that we are disadvantaged. It is just the embodiment of the principle of "mutual benefit."

Marxism measures the correctness of an economic policy or measures implemented by a proletariat party not by how many revolutionary phrases are used in the sentences but by whether it reflects the trend and direction of social economic development, or whether it starts out from reality and thus is beneficial to socialist economic construction; in other words, whether it is in agreement with objective economic laws. If not, it is not correct. In building special economic zones, why do we bestow certain specific favorable conditions on foreign firms? This is based on a consideration of the custom of international cooperation and various economic factors, domestic as well as foreign. It is in agreement with the laws governing the building of special economic zones. During the 10-year period of upheaval, Lin Biao and the "gang of four" implemented a closed-door policy concerning international economic activities and unnecessarily accused too many people of practicing a "foreign slavery" philosophy. As a result, our hands and feet were bound and a serious adverse effect was wrought upon socialist economic construction. This lesson should be sufficiently penetrating for each one of us. We must liquidate the evils left over from the leftist-roaders.

The special zone economy is a supplementary form of the socialist economy. It is closely related with a vast majority of the areas. In order to be able to do a good job of building special economic zones, we must depend on the cooperation of party members, cadres, and the masses in the areas where the special zones are to be located. At the same time, we also need the complete cooperation of the people of the entire province and the entire nation, and their enthusiastic support. Various areas and departments and every walk of life must care for and support the building of special economic zones by creating conditions favorable for them and providing them with various conveniences. We believe that with the cooperation of the people of the areas where the special zones are to be located and the entire population of the province, struggling together with united forces, we shall be able to carry out the task of building the special economic zones.

ECONOMIC PLANNING

BRIEFS

GUANGXI EXCHANGE MEETING--A regional scientific research exchange meeting conducted by factories, mines and enterprises was held in Nanning from 23 to 27 October. Zhou Guangchun and Luo Libing, the regional CCP committee and people's government, attended the meeting and spoke. The meeting held: the launching of scientific research in factories, mines and enterprises is the key to industrial modernization and is an essential condition for them to increase production. Scientific research in factories, mines and enterprises must be established in accordance with actual conditions and must be closely linked with technological renovation to guide and assist the progress of new technology. The meeting stressed: CCP committees and people's governments at all levels must strengthen leadership over the establishment of scientific research organs in factories, mines and enterprises, and bring the roles of technicians into full play. [HK129010 Nanning Guangxi Regional Service in Mandarin 1130 GMT 28 Oct 80]

TIANJIN CITY CONSTRUCTION--The Standing Committee of the Tianjin Municipal People's Congress held its sixth session 12-15 November, discussing the 2,000 outline of the overall planning for Tianjin city construction and the 1981-1983 program for repairing buildings destroyed by earthquakes and for building subsidiary projects. Attending the session were Yan Dakai, chairman of the Standing Committee of the municipal people's congress; Yu Fujing, deputy mayor of Tianjin Municipality; and (Zhou Ganji), deputy chief of the Tianjin Municipal Planning Bureau. [Tianjin City Service in Mandarin 0030 GMT 16 Nov 80 SK]

CSI: 4006

BRIEFS

BANK LOANS FOR GUANGDONG--Since the beginning of the year, the general banking department of the People's Bank of China has issued short-term foreign exchange loans of some U.S.$100 million to Guangdong Province to support the four modernizations efforts in the province. All enterprises which produce export commodities and all units which can directly or indirectly earn foreign exchange income and have the ability to repay the loans are eligible to apply at the various branches of the people's banks for foreign exchange loans. The period of the loans is generally 1 year and the longest period of the loans is 3 years. The preferential annual interest is less than 9 percent. The bank has so far approved loans of some U.S.$38 million. According to incomplete statistics, with the help of these loans, local enterprises' output value has increased by some 37 million yuan and foreign trade departments have increased procurement by some 20 million yuan. [HK270816 Fuzhou Fujian Provincial Service in Mandarin 1035 GMT 24 Nov 80]

HEILONGJIANG PRICE HIKES--The Heilongjiang Provincial Commodity Price Bureau recently held a report meeting of price bureau directors to discuss ways to halt price hikes. The meeting urged the departments concerned to raise the people's understanding of the significance of stabilizing market prices, implement the eight measures set forth by the provincial people's government to curb malpractices liable to be perpetrated by staff and workers of commercial departments, strictly abide by price policies and ensure that no one who violates price discipline will go unpunished. [Harbin Heilongjiang Provincial Service in Mandarin 1100 GMT 26 Nov 80 SK]

HEILONGJIANG CAPITAL CONSTRUCTION SPENDING--Responsible person of the Heilongjiang Provincial Construction Bank said: the usual year-end spending-spree by units undertaking capital construction projects will be substantially reduced this year because a recent circular stipulates that 1980 capital construction funds may be used in 1981 if they are not all spent in 1980. [Harbin Heilongjiang Provincial Service in Mandarin 2200 GMT 26 Nov 80 SK]

ZHEJIANG BANK LOANS--Since the beginning of this year, local construction banks in Zhejiang Province have extended capital construction loans to small enterprises to support their rebuilding, expansion and renewal of equipment. By the end of October, some 142 loans totaling 23.2 million yuan had been granted. [OW161846 Hangzhou Zhejiang Provincial Service in Mandarin 1100 GMT 15 Nov 80]

SHENYANG REVENUE INCREASE--By the end of October, revenue in Shenyang Municipality increased by 27.2 million yuan over the corresponding 1979 period. [Shenyang Liaoning Provincial Service in Mandarin 2200 GMT 26 Nov 80 SK]

HUNAN CONSTRUCTION PROJECTS INVESTMENTS--Instead of being appropriated out of revenue, the investments in capital construction projects in Hunan Province have been borrowed from banks on a trial basis. As a result, funds have been saved and the period of construction has been shortened. At present, construction banks have issued loans of some 106 million yuan to 180 factories, including the Xiangtan Textile, Printing and Dyeing Mill, the (Liyijiang) Electricity Plant, the Hunan Rubber Plant and the Hanshou County Paper Mill, for the purpose of capital construction. As loans must be repaid with interest at the stipulated time and more interest must be paid after the due date, the units which borrow the loans from the banks will naturally see that the loans are used carefully and properly. [Changsha Nunan Provincial Service in Mandarin 1100 GMT 24 Nov 80 HK]

JIANGSU GOVERNMENT CIRCULAR--The Jiangsu Provincial People's Government on 24 November issued a circular urging all localities to strictly enforce financial and economic discipline and prevent the yearend spending spree in order to guarantee the fulfillment of this year's financial revenue plan. The circular called on all localities and departments to collect all taxes due and strive to cut down expenditure. In order to curb the yearend spending spree, the circular stresses that the scale of capital construction should be reduced, that institutional purchasing power should be lowered, that no expenditures should be authorized from now on other than relief funds and that the bank's credit and loans management should be strengthened. [Nanjing Jiangsu Provincial Service in Mandarin 2300 GMT 26 Nov 80 OW]

JILIN ENTERPRISES DEFER, EVADE TAXES--Our reporter learned from the department concerned that at present tax evasion is quite serious at some enterprises in our province, directly interfering with the fulfillment of the tax plan and the plan on financial incomes and expenditures. As of the end of October provincial enterprises have deferred paying some 10 million yuan in taxes owed the state. Some of the enterprises outright evade state taxes. The Changchun Municipal Steel Tube Plant deliberately evaded some 400,000 yuan of state tax from 1978 to June 1980. The municipal people's procuratorate is instituting proceedings against it according to the law. The Changchun Municipal Metal Processing Plant, formerly known as the Changchun No 2 Metal Materials Plant, evaded some 41,000 yuan of state tax from December 1979 to April 1980 by fraudulently reporting less income from marketed products. The department concerned is investigating the case. [Text] [SK281008 Changchun Jilin Provincial Service in Mandarin 1100 GMT 27 Nov 80]

NEI MONGGOL GOLD PURCHASING--Persons of various nationalities in Nei Monggol are vigorously selling gold, silver and gold and silver products to the state. According to incomplete statistics compiled by departments concerned, over 21,000 grams of gold, over 4,747,500 grams of silver and over 75,200 silver coins were sold to the state in the third quarter of 1980. [SK220124 Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 16 Nov 80]

JILIN FULFILLS TAX PLAN--According to our correspondent (Zhang Xinhu), since the beginning of this year, tax departments at all levels throughout the province have made great efforts to increase production and income and practice economy in coordination with the departments concerned. As of 20 November, the Yanbian Korean Autonomous Prefecture and Panshi, Jingyu, Changbai, Changling, Dehui and six other municipalities and counties overfulfilled the annual tax plans. The province has now fulfilled the annual tax plan by 91.5 percent. At present, tax departments at all levels and the masses of tax cadres throughout the province are conscientiously implementing the guideline contained in the State Council's notice on grasping well the November and December plans on financial incomes and expenditures and on controlling financial deficits and the circulation of money. They also go down to grassroots levels to launch tax audits so as to promote production, increase incomes and enable tha province to collect more taxes. [Text] [SK281028 Changchun Jilin Provincial Service in Mandarin 1100 GMT 27 Nov 80]

JINAN CIRCULAR ON FINANCIAL EXPENDITURE--The Shandong Provincial People's Government issued an emergency circular on 19 November, urging various departments to cut down expenses, control the funds in circulation, fulfill the 1980 financial task and inspect the state of financial and economic disciplines throughout the province. The ciruclar contended that all departments, enterprises and establishments must adopt effective measures to increase production and profits and to stop new expenses during the last month of 1980. The people's banks in various localities must supervise departments concerned in giving bonuses, support them to expand purchase and sales, transport commodities to countrysides and to be sold on market, speed up the withdrawal of funds from circulation and of agricultural loans. Such act as randomly giving bonuses, and increasing subsidies and expenses must be strictly handled. [Jinan Shandong Provincial Service in Mandarin 2300 GMT 19 Nov 80 SK]

ZHEJIANG PROFIT ADJUSTMENT--The Zhejiang Provincial Commodity Prices Committee, in cooperation with industrial finance and trade department, made a rational adjustment in profit distribution among light and textile industrial departments. This has stabilized prices of light and textile industrial products and promoted the circulation of commodities. [Hangzhou Zhejiang Provincial Service in Mandarin 1100 GMT 14 Nov 80 OW]

CURRENCY POLICY CHANGE STUDIED--Shanghai, 6 Dec KYODO--China is studying unifying the yuan and foreign currency convertible notes now in circulation into a single currency, Japanese Finance Minister Michio Watanabe said Saturday. Watanabe told KYODO NEWS SERVICE that China made the disclosure at the Japan-China ministerial conference held in Beijing this week. He said China officially denied rumors that it would devalue the yuan, suspend the issuance of the convertible notes and fix double exchange rates for the currency. Watanabe is here on his way home from Beijing. [Text] [OW060646 Tokyo KYODO in English 0631 GMT 6 Dec 80]

'XINHUA' ON COAL INDUSTRY, KAILUAN COAL MINE PROBLEMS

OW132042 Beijing XINHUA Domestic Service in Chinese 0307 GMT 11 Dec 80

[Letter from XINHUA reporters Guo Jie and Li Zhengjie: "Coal Industry Readjustment as Seen From Kailuan"]

[Excerpts] Shijiazhuang, 11 Dec (XINHUA)--As conditions at the Kailuan coal mine show, it is impossible for the coal industry to make readjustments so long as output plans, made according to needs, remain unchanged.

We found that Kailuan's readjustment is quite slow. Why? The leading cadres and technical and engineering personnel we have interviewed all say that readjustment is indeed imperative but they just have no time for it.

The reason that they can spare no time for readjustment is, we understand, that on the one hand mountains of problems await immediate solutions because the mine underwent serious sabotage during the 10-year catastrophe resulting in disproportionate excavations and a lack of maintenance for equipment and coal pits and, on the other hand, the state demands greater coal output as this industrial foodstuff is short of meeting the needs of the national economy. In other words, readjustment is necessary, although output quotas cannot be lowered.

Kailuan is one of our reputable coal bases. With a large number of veteran workers and a better than average level of management and equipment, the production situation in Kailuan has always been good. Even during the 10-year disturbance, Kailuan's output kept rising. During the fourth 5-year plan from 1971 to 1975, its output shot up from 16.64 million dun to 25.63 dun, doubling its original production capacity of 12.6 million dun and averaging a 2-million dun increase each year. However, these high increases brought along a series of problems. Before the mine could take a breath, it was hit by the strong earthquake of 1976 and sustained extremely serious damage. Nearly all of its surface buildings were wiped out and its principal production shafts inundated. Yet, because there was an acute shortage of coal at that time, the state demanded that the mine resume production as soon as possible and strive to reach the pre-earthquake output level. Thus the mine drained the shafts and excavated coal at the same time. The tunneling task was, therefore, delayed by 1 to 1.5 years while 13 million dun of readily available coal was excavated, resulting in critically disproportionate excavations that further aggravated the originally weak link of its coal production.

The first year after the earthquake, 1977, the state demanded that Lailuan reach the pre-earthquake capacity of 12.6 million dun. The staff and workers of Kailuan worked desperately and produced 12.68 million dun of coal that year. In 1978, the state demanded Kailuan double its output to reach the pre-earthquake peak of 25.2 million dun. At the output quota was set purely according to needs and beyond its actual ability, it produced only 21.5 million dun after a whole year's hard work. In early 1979, the state set Kailuan's output quota at 23.5 million dun but later reduced it to 21.5 dun. In early 1980, the output quota was set at 20 million dun. The situation each month was invariably short of targets at the beginning, catching up in the middle and working desperately toward the end. Output quotas had to be lowered once again.

Under the pressure of output quotas, Kailuan has never wholly regained its sappe vitality. If it has to go on working desperately with ills uncured, it is possible that someday it will fall seriously ill and never can be cured. Some Kailuan comrades have put it well: "Day in and day out, you cannot even take a breath under the pressure of the output quota, how can you have time and energy to take care of readjustment?"

From the problems experienced by Kailuan, we can see that production plans should not be made on the basis of needs only but also according to objective capabilities.

LIAONING EXPERIENCE EXCHANGE MEETING--The leading group of the northeast power grid recently held an experience exchange meeting on conserving power, using power in a planned way and relying on the masses to run power stations in Anshan Municipality. Attending the meeting were some 350 technicians and specialists from petrochemical and metallurgical industrial enterprises. Five experts were invited to give speeches. They discussed ways to conserve electricity and suggested many constructive views and measures in this regard. [Shenyang Liaoning Provincial Service in Mandarin 1100 GMT 21 Nov 80 SK]

SHAANXI ENERGY CONSERVATION--The industry and communications front in Shaanxi Province has done a good job in energy conservation this year. According to incomplete statistics, from January to September the province saved a total of 350,000 tons of coal, over 200 million kwh of electricity, 5,000 tons of heavy oil and nearly 20,000 tons of oil finished products. The total value of these savings was 35 million yuan. [Xian Shaanxi Provincial Service in Mandarin 2300 GMT 10 Nov 80 HK]

NORTHWEST MEETING ON POWER STATIONS--The five northwest provinces and autonomous regions recently held a seminar in Baoji, Shaanxi, on the remote control of power stations and transformer stations, a measure which would fundamentally solve the current problems of insufficient safety, speed and accuracy in power generation and transmission in the region. The unmanned, automatic operation of these stations by remote control has never been attempted in the region. The meeting, sponsored by the Baoji power supply bureau, gave the participants an idea of the technical problems and demands, and trained a number of technicians for advancing the work. [Xian Shaanxi Provincial Service in Mandarin 1100 GMT 7 Nov 80 HK]

HEILONGJIANG MARSH GAS--Jointly developed by the Shuangcheng County Marsh Gas Office and the Dongfanghong Brigade, the biggest marsh-gas power station in Heilongjiang Province was put into operation on 17 November in Shuangcheng County. The station has a 14-kilowatt generator and a fermentation tank which is 20.07 meters in length, 4.5 meters in width and 2.1 meters in depth and which can produce 40 cubic meters of march gas a month in normal temperatures. [Harbin Heilingjiang Provincial Service in Mandarin 1100 GMT 21 Nov 80 SK]

LIAONING OIL PRODUCT SERVICE CENTER--The Liaoning provincial oil product consultation service center was recently established under the support of the Provincial Petrochemical Industry Bureau, the Provincial Commercial Scientific Research Institute, the Shenyang Oil Purchase and Supply Station, the provincial oil company and refineries concerned. Its purpose is to provide the latest information on oil products, their utilization, application of petroleum-related technologies, energy conservation and technical cooperations at home and abroad by making full use of scientific and technical personnel in the province's petroleum industrial departments. HUGE URANIUM DEPOSIT FOUND IN HUAGANG CRAG

Beijing RENMIN RIBAO in Chinese 30 Aug 80 p 1

[Article by Li Weiyao [2621 1218 1031] and Zhang Yousheng [1728 0645 3932]: "Tan Mutao Opens Up a New Realm by Finding Uranium in Stratum of Huagang Crag"]

[Text] China has discovered an exceptionally large uranium deposit in a fractured stratum of mesozoic granite. Engineer Tan Mutao [6007 0645 3932], director of the Guangdong Provincial Geological Bureau, contributed to the discovery and verification of the deposit.

In the past, some foreign experts had categorically asserted: "There are no large mineral deposits in the Mesozoic Era stratum of Huagang Crag" and "One cannot drill more than 200 meters into Huagang Crag." A regional geological survey team, however, discovered many unusually radioactive points (belts) in Huagang Crag of the Nanling Mountains. Geological Team 705, whose mission is to find uranium, immediately began prospecting. Tan Mutao, as the technical responsible person on this team, personally directed the prospecting and drilling, and, in less than 4 years, handed over to the state a big uranium mine.

To solve the mystery of whether there was a mineral deposit in the Mesozoic Era stratum of Huagang Crag, Tan Mutao began by summing up his experiences in searching for mineral deposits, and then led the geological personnel in scaling sheer precipices and overhanging rocks in order to investigate outcroppings and drill tunnels, gathering and putting in order several hundred thousand words of firsthand material. After analysis and study, he confirmed that about 1 million years ago there were many violent movements of the earth's crust here (the so-called Yan Mountain Range activity). Huagang Crag, a product of the later period of this activity, contains thermoliquified uranium [youreye 6914 3583 3210], which from deep in the earth's crust runs along a fault line up to the earth's surface, forming a mineral deposit. By mastering a great amount of data, he was able to draw a circle around a 76-square kilometer mineral field and to draw up a 7-year plan for it. From the end of 1965 to 1966, the Ministry of Geology mustered its forces to explore, on two occasions, the No 9 hole picked out by Tan Mutao on the mineral vein. After more than a year, the ministry, overcoming all sorts of difficulties, verified that there was an especially large uranium vein centered on the No 9 hole. From 1967 to 1979, Geological Team 705 handed over to the state large industrial reserves of uranium.

In 1979, Comrade Tan Mutao was a member of our country's uranium geological delegation that went to America, and he attended the annual symposium on uranium of the American Petroleum Geologists Society, at which he read his scientific paper on "Geological Features and Formation of Thermoliquified Uranium in Huagang Crag of the Nanling Mountains." The scientists at the symposium thought highly of and commended his paper. In April of this year, he was elected to be a model worker in the national geological system.

BRIEFS

JILIN GOLD ENTERPRISES--As of 15 November, about 75 percent of the provincial gold mines overfulfilled their annual gold production plans. Key gold producing areas such as Jilin, Yanbian and Tonghua overfulfilled the state production plan. By the end of October gold enterprises throughout the province gained profits of some 2.55 million yuan, overfulfilling the annual plan by 18.7 percent, an increase of 9.1 times over the 1979 figure. [Changchun Jilin Provincial Service in Mandarin 1100 GMT 26 Nov 80 SK]

TIANJIN GOLD--The Tianjin Electrolytic Copper Plant extracted 10,272 liang of gold from the anode slime in the process of copper electrolysis during the first 10 months of 1980. This figure was 78 percent higher than the figure for the corresponding 1979 period. [Tianjin City Service in Mandarin 0030 GMT 12 Nov 80 SK]

INDUSTRY

PRC LIGHT INDUST[illegible] MINISTRY CIRCULAR ON PRICES

OW141750 Beijing XINHUA Domestic Service in Chinese 1252 GMT 13 Dec 80

[Excerpts] Beijing, 13 Dec (XINHUA)--The Ministry of Light Industry on 12 December issued a circular urging light industry departments and enterprises in all localities to firmly implement the provisions contained in the State Council's circular on strictly controlling commodity prices and reorganizing negotiated prices. It also urged these departments and enterprises to conscientiously readjust the prices for products to be sold by manufacturers themselves at exhibitions or on a trial or commission basis.

The light industry ministry's circular says: Retail outlets, sales exhibitions, promotional sale centers, marketing agencies and all other self-marketing channels of light industry departments and enterprises at all levels, whether state or collectively-owned, should act according to the provisions in the State Council's circular. Manufactured goods whose prices are fixed by the state should be sold at the state-fixed prices. Price increases are not permitted. Retail prices of commodities reached through negotiations should stick to the price levels prevailing on 7 December 1980. These commodities may be sold at lower prices, but price increase are not permitted.

The circular stipulates that light industry departments and enterprises at all levels should not increase their profits or give bonuses by fixing a higher price or increasing the prices in a disguised manner or other illegal methods. Severe punishments should be meted out to those who violate laws and discipline.

The circular says: Factory prices and self-marketing prices of light industrial products should be readjusted in earnest. According to the regulations, downward readjustments of prices may be allowed. In future, all applications for price readjustments should be filed according to the authority in price administration stipulated in state regulations for final approval.

PRC TEXTILE INDUSTRY STRESSES RESEARCH, INNOVATION

OW141223 Beijing XINHUA Domestic Service in Chinese 0755 GMT 13 Dec 80

[Excerpts] Beijing, 13 Dec (XINHUA)--This correspondent has learned from the national report meeting of the textile industry on scientific and technological achievements now being held in Beijing that in the past few years China's textile industry has actively developed scientific research and technical innovations in the light of production requirements and has achieved rather good economic results. Without much expansion in equipment and capacity, the country's textile industry has increased output and output value rapidly year after year.

In the field of cotton textile industry, after solving the technical problems in the spinning, weaving, dyeing and finishing of medium and long fibers and chemical fibers in the 1970's, the scientific research departments have been actively developing medium- and high-grade chemical fiber products, such as imitation wool and silk fabrics and knitted coats. The cotton textile industry in Shanghai has added little, if any, equipment in the past 10 odd years, yet its output value has increased from 4.8 billion yuan to 8.9 billion yuan, or 85 percent, thanks to the adoption of new technology. The output value and profit of the cotton textile industry of the country as a whole has increased by an annual average of about 10 percent in the past 3 years.

In the past few years, the textile industry has made vigorous efforts to popularize and apply the result of scientific research to translate these results into productive forces as quickly as possible. It is learned that the number of scientific research items of the textile industry appraised and approved for popularization throughout the country in 1979 and 1980 is 56 percent more than the total number in the 1971-78 period.

In the past few years, the country's textile scientific research departments have also made vigorous efforts to restore and consolidate the scientific research organizations, and a textile scientific research system has begun to take shape, insuring and spurring the development of scientific and technological work. At present, there are already 83 textile scientific research institutions at the national and provincial and municipal level, and a number of large and medium-sized enterprises have also set up research institutes or laboratories.

CSO: 4006

BRIEFS

ANHUI HEFEI LIGHT INDUSTRY--The Hefei Municipal CCP Committee and the municipal People's Government in Hefei called on the industrial departments to increase the output of highly demanded products in the 4th quarter, including 10,000 cartons of cigarettes, 10,000 wrist watches, 10,000 bicycles, 100 dun of wine, 1,000 dun of cotton yarn, 5,000 dun of rolled steel, 100,000 pieces of garments and 500 dun of plastic products. Their output value can reach a total of 47.1 million yuan, and the state can receive an additional 10 million yuan in tax and profits. [Hefei Anhui Provincial Service in Mandarin 1100 GMT 14 Nov 80 OW]

GUANGDONG BOOSTS INDUSTRIAL PRODUCTION--Guangdong has initially readjusted its industrial structure this year and stepped up the development of the light and textile industries. Total value of industrial output from January to the end of November was 9.2 percent higher than in the same period of last year. This included a 15.7 percent increase in light industry, a development speed far exceeding that of heavy industry. According to statistics of departments concerned, the speed of development of the province's light and textile industries this year, including the No 2 light industry system, has consistently exceeded that of all heavy industry sectors. The proportion of light industry in the total industry of the province has increased from 57.5 percent in the same period of last year to 61 percent. In prefectures and municipalities where the proporition of light and textile industries is relatively high, such as Guangzhou Municipality, Foshan and Shantou prefectures, and Foshan, Shantou, Jiangmen, Zhanjiang and Chaozhou municipalities, total value of industrial output from January to November not only exceeded the progress demanded by the year's plan but also greatly increased over the same period of last year. [Text] [HK140652 Guangzhou Guangdong Provincial Service in Mandarin 2345 GMT 13 Dec 80]

GUANGDONG COLLECTIVE ENTERPRISES--Collective-ownership industrial enterprises in Guangdong have worked hard to enliven their production. Total value of their output from January to October was 5.39 billion yuan, 21 percent more than in the same period of last year, and accounting for more than half the total value of industrial output in the province. The proportion of collective industry in the province's industry has risen from 26.4 percent last year to 29.2. [Guangzhou Guangdong Provincial Service in Mandarin 1120 GMT 14 Nov 80 HK]

GUANGDONG CHEMICAL FERTILIZER OUTPUT--Small chemical fertilizer plants in Guangdong Province produced 310,000 dun of chemical fertilizer during the first 10 months this year. This output was achieved by their efforts to increase production, improve quality and cut down energy and material consumption. [OW251525 Beijing Domestic Service in Mandarin 0400 GMT 22 Nov 80]

GUANGDONG SALT DEPOSIT--Beijing, 16 Nov (XINHUA)--Guangdong Province has discovered a deposit of glauber salt and rock salt on the northern outskirts of its capital Guangzhou, according to the Ministry of Geology. Reserves of 13 million tons of glauber salt and 64 million tons of rock salt have been verified in the deposit, the first discovered in Guangdong Province. The salt is of good quality. The deposit is near the surface and transport facilities are convenient. Glauber salt and rock salt are important raw materials for the chemical industry, and Guangdong Province has long been badly in need of them.[Text] [OW161823 Beijing XINHUA in English 0241 GMT 16 Nov 80]

GUANGZHOU INCREASES OUTPUT, PROFIT--Guangzhou Municipal Industry increased output and income throughout the January-November period. According to statistics, total value of output during the period was 11.6 percent greater than in the same period of last year. Industrial profit from January to October was 29.75 percent greater than in the same period of last year. Profits turned over to the state by state-owned industrial enterprises rose by 28.2 percent. At the beginning of the year the municipality designated 61 products as key products for development, including bicycles, sewing machines, wristwatches, perfume, flashlights and knitted goods. The municipal authorities raised 120 million yuan in investment to tap potentials and carry out innovations and reforms in the factories making these products. [Summary] [HK140654 Guangzhou Guangdong Provincial Service in Mandarin 2345 GMT 13 Dec 80]

HEBEI PHOSPHATIC FERTILIZER PRODUCTION--After Hebei Province fulfilled its quota for the production of 570,000 metric tons of phosphatic fertilizer 110 days ahead of schedule, it overfulfilled its quota for production for 1980 by the end of October. Its actual output was 41.7 percent more than in the corresponding period of last year. The output of standard phosphatic fertilizer in Shijiazhuang Prefecture was 53.2 percent more than in the corresponding period of last year. The province had 120 phosphatic fertilizer plants at and above county level in the first half of last year but, because the positions of these plant premises were irrationally arranged and these plants were poorly managed, the quality of their products was poor and they incurred serious losses. They lost some 16.14 million yuan last year. After readjustment, the province now has only 90 phosphatic fertilizer plants. Although the number of phosphatic fertilizer plants is smaller, enterprise management has been strengthened, output has greatly increased and the quality of products has been impvoed accordingly. [Shijiazhuang Hebei Provincial Service in Mandarin 0430 GMT 17 Nov 80 HK]

HEILONGJIANG CHEMICAL FERTILIZER PLANTS--During the period from January to September 24 of the 44 small chemical fertilizer enterprises in Heilongjiang Province were closed or merged, and the remaining 20 produced some 7,600 tons more chemical fertilizer than the original 44 did during the whole year of 1979. After the readjustment of the enterprises, the costs of production and fuel, and power consumption have also been reduced. The cost of producing 1 ton of nitrogeneous fertilizer has been reduced by 42 percent and phosphate fertilizer by 8 percent. The per-ton coal consumption of synthetic ammonia has been reduced by 33 percent and its electricity consumption by 42 percent. [Shenyang Liaoning Provincial Service in Mandarin 1100 GMT 11 Nov 80 SK]

HUBEI INDUSTRY BOOSTS PRODUCTION--According to HUBEI RIBAO, Hubei has done well in fulfilling industrial plans this year. Total value of output from January to November amounted to 97 percent of the year's plan and was 18.9 percent more than in the same period last year. Output of 40 out of 80 major products has fulfilled or overfulfilled the year's plan, and output of 54 products increased compared with the same period last year. January-October profits of state-owned enterprises in the province were 24.7 percent greater than in the same period last year. "The development speed of the province's light industry has continued to exceed that of heavy industry. Total value of light industry output from January to November was 21.7 percent greater than in the same period last year and 5.3 percent higher than the heavy industry growth rate. The percentage of value of light industrial output in total industrial output value increased from 46.2 in the same period of last year to 47.4. Due to the change of proportions in light and heavy industry, value of industrial output without any increase in raw material consumption rose by 150 million yuan." The province has continued to improve quality and increase variety of products. Hubei industry has also made efforts to economize energy. Industrial output from the first to the third quarters rose by 23.1 percent, while energy consumption only increased by 15.1 percent. The province saved a total of 570,000 tons of coal, 54,000 tons of oil, 22,000 tons of coke, and 190 million kwh of power. [Summary [KH110427 Wuhan Hubei Provincial Service in Mandarin 1100 GMT 8 Dec 80]

NATIONAL NITROGEN FERTILIZER EQUIPMENT--From 5 to 9 November, the Ministry of Chemical Industry sponsored a meeting on the national technical cooperation network of large nitrogen fertilizer equipment in Lanzhou Municipality, Gansu Province. The meeting noted that the 13 sets of imported 300,000-ton synthetic ammonia production equipment and 480,000-ton urea production equipment and other home-made similar equipment, which went into operation between 1976 and 1979, are fairly advanced in the world. However, the meeting said, years of production experience has shown that there are still shortcomings in the equipment. It was for the purpose of improving the management of the large chemical fertilizer production equipment that the Ministry of Chemical Industry established the cooperation network. [Lanzhou Gansu Provincial Service in Mandarin 1125 GMT 14 Nov 80 SK]

NEI MONGGOL LIME KILN--The first mechanized lime kiln in Nei Monggol region was put into operation on 19 November at the Nei Monggol construction company. With designed capacity of 100 tons per day, the lime kiln can produce an extra of 20,000 tons of commodity quick lime in addition to meeting the needs of the Nei Monggol construction company every year. [SK231235 Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 21 Nov 80 SK]

SYNTHETIC FIBER CONFERENCE IN SHANGHAI--Shanghai, 16 Dec (XINHUA)--The national conference on exchanging experience in production in synthetic fiber industry closed in Shanghai on 14 December. The conference held that to effectively solve the clothing problem for China's 1 billion people, it is necessary to further promote the production of synthetic fiber while developing the production of natural fiber. In developing the production of synthetic fiber next year, it is necessary to put the stress on improving the quality of products, increasing the designs and varieties and lowering the consumption of raw materials. The conference was called by the Ministry of Textile Industry. According to the report made at the conference, China has made fairly good progress in the development of synthetic fiber production in the past few years. The total output of synthetic fiber in China in 1978 was 287,000 dun. It is estimated that the output will reach 420,000 dun by the end of this year, increasing by more than 46 percent over that of the year before last. Attending the conference were some 120 representatives from 24 provinces, municipalities and autonomous regions including Beijing, Liaoning, Shanghai and Sichuan. [Excerpts] [OW161131 Beijing XINHUA Domestic Service in Chinese 0703 GMT 16 Dec 80]

TIANJIN INDUSTRIALISTS MEETING--The Tianjin Municipal Branch of the China Democratic National Construction Association and the Tianjin Municipal Federation of Industrialists and Businessmen met 19 November to exchange members' experiences in working for the four modernizations. Former industrialists and businessmen spoke at the meeting. Yang Tianshou, vice chairman of the Tianjin Municipal Branch of China Democratic National Construction Association, urged participants to make new contributions to the four modernizations. [SK220132 Tianjin City Service in Mandarin 0030 GMT 20 Nov 80 SK]

TIANJIN AUTO INDUSTRY--Tianjin Auto Industrial Company readjusted enterprises to resume the production of 130-model motor vehicles in 1980. As of early November, this company made a profit twice as much as in the corresponding 1979 period, increased its industrial output value by 44 percent, spare parts by 30 percent and output of 130-model motor vehicles by 5 times. In addition, it also raised its labor productivity by 42 percent. [Tianjin City Service in Mandarin 0030 GMT 23 Nov 80 SK]

'GONGREN RIBAO' DISCUSSES REDUCED SCALE OF CONSTRUCTION

HK060628 Beijing GONGREN RIBAO in Chinese 15 Nov 80 p 1

[Commentator's article: "A Reduction of the Scale of Construction Must Start With Large Projects"]

[Text] This is the second year of the readjustment of the national economy. In the past year and more, all areas and departments of the country have thoroughly upheld the party Central Committee's guidelines for the readjustment of the national economy. In the area of capital construction, they have successively suspended or postponed several hundred large and medium-sized construction projects and several thousand small projects, so that there has been a reduction in the original scale of construction. Nevertheless, in the past 2 years, there have again appeared a great number of large and extra-large construction projects. Overextension in the area of capital construction continues to be a serious matter.

This has become a major problem now confronting us in the readjustment of the national economy. Given the existing scale of construction for large and medium-sized projects, and based on the state's allocation of funds for these projects for the current year, it will take at least 5 or 6 years from next year to complete all of them, even if no more new projects are added. Such a large scale of construction obviously far exceeds the financial and material resources that can be provided by the state. Capital construction investments generally account for around 40 percent of our national expenditure. This is quite a large percentage. We must redress the imbalance in our national economy. We must reduce the rate of accumulation to around 25 percent, dilute and remove the red ink in the balance of payments as quickly as possible and inject life into the national economy. The immediate problem is to show still greater determination in further reducing the scale of capital construction. Otherwise, fighting a continuing war of attrition will put us in an increasingly passive state. Not only will the economy be unstable but it will be difficult to make reforms. The people will also suffer in their standard of living. In a word, the key to the current readjustment of the national economy lies in a reduced scale of construction.

As things now stand, after 2 years of readjustment in the preceding and the current year, a great number of ordinary construction projects have been basically suspended or postponed as they should be. Those that remain are mostly projects urgently needed by localities or by the state, or projects that are near completion. Not much can be done as far as these projects are concerned. Besides, not much money is to be invested in these remaining projects. Even if a large number of them are further given up, the scale of construction cannot be greatly reduced. Thus, where can "something" be done to reduce the scale of construction? Of the existing projects, there are a great number of large and extra-large ones they involve large amounts of capital and advanced techniques. Some of them were introduced from abroad. Though these projects have been checked and evaluated in the past 2 years, nothing much has been done about them because they concern matters of consequence and call for great caution. According to statistics, by the end of last year, the unfinished large and extra-large projects in the range above 300 million yuan accounted for only around 10 percent of the total number of large and medium-sized projects under construction in the whole country. But in terms of the volume of work being done, they represented over 76 percent of all the large and medium-sized projects under construction. These large and extra-large projects have a great impact. The addition of another such project means the discontinuance of many medium-sized and small projects, while the discontinuance of one of them means the maintenance of a large number of urgently needed projects. Therefore, we must show greater determination in reducing the scale of construction. We must continuously look into ordinary medium-sized and small projects and suspend or postpone those which are not urgently needed. Apart from taking these measures, we must shift the focus of attention to those large and extra-large projects. A reduction of the scale of construction must start with these projects!

Of these large and extra-large projects, many are really urgently needed at present and have been provided with the necessary conditions for their completion. We should continuously pay close attention to working on them. But there are also many projects that are a drain on energy resources. They are "tigers" with a voracious appetite for oil, coal and electricity. As things now stand, they are very likely to be futile exercises, since they are mostly not assured of such necessities as resources, raw materials, fuel, power, communications facilities, transportation, and so forth. Even if brought to completion, these projects will only lie unused. They will be left exposed to the elements and will be good only as showpieces. They contribute nothing to the economy. Their completion will only cause a greater waste of money. This will mean a repetition of the same mistake of the Wuhan Iron and Steel Company with its 1.7-meter rolling mill project. At the recent third plenary session of the Fifth NPC, many deputies raised questions and aired views about the construction work on certain extra-large projects. This fully reflected the voice of the masses of people. Therefore, now is the time for us to show greater determination in making a serious reappraisal beginning with these large and extra-large projects.

These large and extra-large projects call for a great amount of capital, advanced technology and precision equipment and involve a wide scope and complicated conditions. Work has been started on some of them over a fairly long period of time. Greater caution must be exercised in treating them. First, we must bear in mind the adjustment of the national economy as a whole and do what is within our capacity. Those projects that should be discontinued in light of the whole situation must be resolutely stopped. We cannot think only of the benefits of an individual project or stress only the interests of a certain area or department and refuse to part with it. In fact, these supposed benefits of an individual project and interests of a certain area or department always prove to be [word indistinct], because they depend on the fulfillment of all the requirements linked with a given project. These requirements, as things now stand, can hardly be met. Second, every project must be referred to experts and actual workers in various fields, so that they can make an adequate economic and technical evaluation of whether or not it should be continued or discontinued, of whether it is progressing rapidly or slowly, of its progress based on original plans or reduced scale, and of the various losses liable to be incurred if the project is discontinued. Various programs can also thus be formulated for comparison and selection, so that we can make the best of a bad situation and avoid doing things haphazardly. Third, the discontinuance of a construction project will inevitably cause losses. Especially where technically advanced projects involving a wide scope, a [word indistinct] quantity of equipment, precision instruments and complicated machines are concerned, we must, after their discontinuance, pay proper attention to the maintenance and safekeeping of the equipment, make proper arrangements for the workers and take other necessary measures. The cadres and workers of the units related to these projects should have a high sense of responsibility. They must hold themselves responsible to the state and the people, cut losses to a minimum, and do a proper job of reducing the scale of construction.

BRIEFS

HUNAN CAPITAL CONSTRUCTION PROJECTS--Since the readjustment of the national economy about 1 year ago, Hunan Province has checked up twice on projects under construction and reduced the amount of investments in capital construction projects by some 860 million yuan. As a result, the number of projects under construction throughout the province has been reduced from 3,292 in 1979 to 2,156 at present. The number of large and medium projects has been reduced from 32 to 15. The investments in electricity, coal and construction materials in capital construction projects account for 90, 77 and 98 percent of the annual quotas respectively. The investments in culture and public health capital construction projects are 3 percent more than the annual quotas. The province has completed construction of residential houses on 1.27 million square meters, some 264,000 square meters more than in the corresponding period of last year For many years, under the influence of the leftist ideology, the province had not done what it was capable of in capital construction. It had embarked on too many and too large-scale capital construction projects at the same time. This year, the construction of 78 projects, the investments in each of which were more than 100,000 yuan has been suspended or delayed. [Changsha Hunan Provincial Service in Mandarin 1100 GMT 24 Nov 80 HK]

JILIN HOUSING CONSTRUCTION--Since the beginning of 1980, Jilin Province has invested some 16 million yuan to build private housing with a total floorspace of some 100,000 square meters. These houses are ready for sale in nine municipalities and eight counties and townships. By the end of October houses with a total 82,000 square meters in floorspace had been sold, thus solving the housing problems of some 2,000 staff households. Buyers who pay cash will enjoy 20 to 30 percent discount. The Changchun Municipal Housing Bureau recently received some 400 buyers of whom 60 had decided to pay cash immediately. [Changchun Jilin Provincial Service in Mandarin 1100 GMT 26 Nov 80 SK]

SHANDONG CONSTRUCTION PROJECTS--Construction departments throughout Shandong Province have scored achievements after launching a construction emulation drive. By the end of September, 170 construction projects were evaluated as model ones. The total construction area of these projects reached 339,700 square meters. From January to October, construction departments throughout the province constructed and installed projects worth 590 million yuan, an increase by 10.8 percent over that of the corresponding 1979 period. They raised labor productivity to 3,395 yuan, an increase of 10.4 percent over that of the corresponding 1979 period. The provincial construction commission, the provincial trade union council and the provincial construction project bureau held a meeting recently in Jinan to commend advanced construction departments, exchange their experiences on construction and discuss specific measures in this regard. [Jinan Shandong Provincial Service in Mandarin 2330 GMT 24 Nov 80 SK]

ZHEJIANG ECONOMIC READJUSTMENT--Since the beginning of this year, Zhejiang Province has again stopped or suspended the construction of 33 capital construction projects, thus reducing total investment by 180 million yuan. Emphasis on local capital construction has also been readjusted. Agricultural investment has increased to 41.7 percent. Investments in culture, education, public health, and scientific research have increased to 11.1 percent. Investments in urban construction, housing and environmental protection have increased to 10 percent. [Hangzhou Zhejiang Provincial Service in Mandarin 1130 GMT 14 Nov 80 OW]

ZHEJIANG CAPITAL CONSTRUCTION--Thirty-three capital construction projects have been suspended or deferred in Zhejiang Province since early 1980, reducing investment by 180 million yuan. The proportion of capital construction investment among all trades has been readjusted. The portion allocated for agriculture has been increased from 28.9 percent in 1979 to 41.7 percent, that for culture, education and scientific research has been increased from 6.9 percent to 11.1 percent, and that for urban construction, workers' housing projects and environmental protection has been increased from 9.3 percent in 1979 to 10 percent. Housing projects covering 1.17 million square meters of floor space were completed in Zhejiang. [Beijing Domestic Service in Mandarin 1200 GMT 17 Nov 80 OW]

ZHAOQING CEMENT OUTPUT--As of the end of October, cement plants in the Zhaoqing Prefecture, Guangdong, produced 270,500 metric tons of cement, fulfilling 2 months ahead of schedule their annual cement output quota of 270,000 metric tons and registering a 31 percent increase over the comparable period of 1979. The leadership of Zhaoqing Prefecture has given priority to developing five of 15 cement plants in the area, which have the necessary conditions for expansion. The other 10 plants will also undergo technical reforms by stages. [Guangzhou NANFANG RIBAO in Chinese 27 Nov 80 p 2]

NEI MONGGOL URBAN CONSTRUCTION--The Hohhot Municipal People's Government recently held a meeting and set forth five measures for urban construction in Hohhot Municipality. 1) Strictly control population. With 440,000 residents in 1979, Hohhot is allowed to have only 56,000 more during the next 20 years. 2) Strictly control the expansion in the urban area. Hohhot occupied an area of about 52 square kilometers in 1979, close to the future set for 1985. All large and medium-sized industrial construction projects should be built 65 square kilometers away from the urban area. 3) Strictly control the disposal of gas, liquid and solid wastes. Deadlines should be set for plants to modify their chimneys and the like to prevent pollution. 4) Accelerate housing construction. The living area for each resident in Hohhot now is 3.6 square meters. This falls short of meeting the target of 5 square meters per person by 1985. 5) Actively promote comprehensive utilization of urban areas. Preparations should be made to initiate a company to this effect and begin charging for the utilization of urban lands. [Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 2 Dec 80 SK]

BRIEFS

GANSU MARKETS--Gansu Province has progressively developed rural trade fairs and urban farm produce markets following the third plenary session of the party Central Committee. Now the province has 577 rural trade fairs and 31 urban farm produce markets. Both the variety and quantity of products have shown remarkable increase. The prices of many farm produce have declined, especially the price of grain, edible oils and meat which have declined by 2 percent on an average. Wheat is sold at 22 fen per jin in some parts of Hexi area. During the first 9 months of this year, the total sales in the province's rural trade fairs and urban markets reached 160 million yuan, accounting for 8.1 percent of the province's total retail sales of commodities and up 59 million yuan over the corresponding months of 1979. According to incomplete statistics, the province has 18,000 individual businessmen and artisans. [SK271250 Lanzhou Gansu Provincial Service in Mandarin 1125 GMT 24 Nov 80 SK]

BEIJING RETAIL SALES--The total retail sales of commodities in Beijing reached some 540 million yuan as of October, an increase of 5 percent over the corresponding 1979 period. Departments concerned said that in 1980 the total retail sales of commodities in Beijing as a whole is expected to be a record 6 billion yuan. [SK220046 Beijing City Service in Mandarin 1030 GMT 18 Nov 80 SK]

HENAN TRADE MARKETS--Urban and rural trade markets in Henan have done lively business this year. Total business at the markets from January to October amounted to 1.5 billion yuan, equivalent to the total for the whole of last year and accounting for about 15 percent of commodity retail sales in society this year. Total business at agricultural and sideline product markets in 16 municipalities rose by 63 percent over last year. [HK220823 Zhengzhou Henan Provincial Service in Mandarin 1100 GMT 18 Nov 80]

SHANGHAI MANUFACTURED GOODS--According to the Shanghai Branch of the XINHUA NEWS AGENCY, by 15 November Shanghai had fulfilled the annual plan for the delivery of commodities out of the city. The total volume of manufactured goods delivered to Beijing, Liaoning, Heilongjiang, Shaanxi, Nei Monggol and other provinces, municipalities and autonomous regions this year topped the same period last year by 5.5 percent. Shanghai's commercial departments have helped factories overcome the shortage of raw materials in the production of manufactured goods for daily use and have coordinated efforts with transportation departments to expedite delivery. FOREIGN TRADE

PRC ORGANS HELP IMPORT TECHNOLOGY, PROMOTE TRADE

OW131641 Beijing XINHUA Domestic Service in Chinese 1302 GMT 11 Dec 80

[Text] Beijing, 11 Dec (XINHUA)--The Standing Committee of the Central Committee of the China Democratic National Construction Association and organizations of All-China Federation of Industry and Commerce in all localities have started to do liaison work and played an active role in importing technology and promoting foreign trade.

Since the organizations of the China Democratic National Construction Association and All-China Federation of Industry and Commerce in all localities held their respective national congresses in October last year, they have fully used their favorable conditions to actively make contacts with compatriots in Hong Kong and Macao, Taiwan compatriots, overseas Chinese and foreign industrialists and businessmen and, according to the needs of the state and the request of the other parties, establish contact with departments concerned to import advanced technology, promote foreign trade and joint venture, carry out technical exchange and introduce information and data. They have played the role of "go-between."

Initial statistics show that the Standing Committee of the China Democratic National Construction Association and All-China Federation of Industry and Commerce have maintained ties with 56 companies in Hong Kong and foreign countries, covering 102 trade items, 6 academic and technical exchange items and 13 joint venture and technological import items. The organizations of the association and federation in Shanghai Municipality got in touch with over 200 Hong Kong and overseas Chinese businessmen and foreign businessmen from February last year to October this year. Over 60 of them were introduced to departments concerned to hold trade talks. The 22 items on which agreements were reached included garments, textile, electronic products, hardware and machinery, livestock product processing, handicrafts and transaction on credit.

To promote China's scientific and technological development, organizations of the association and the federation in some places have come in contact with overseas Chinese and foreign scholars and experts introduced by members of the association and the federation and invited them to give lectures and make technical exchange in our country. The two organizations in Guangzhou Municipality have introduced 65 technical experts, invited them to come to China to conduct technical exchange and helped foreign firms sponsor large scientific and technological exhibitions and technical exchange meetings in China. They are all welcomed by scientific and technical personnel in China.

To further do liaison work well, the China Democratic National Construction Association and the All-China Federation of Industry and Commerce held a liaison work discussion meeting attended by members of the two organizations in some provinces and municipalities from 4 to 10 December. The meeting exchanged the experience in doing liaison work in all places and aired ideas about the work in future.

BRIEFS

BEIJING, JAPANESE COMMERCE-INDUSTRY CLUB--Beijing, 11 Dec (KYODO)--A Beijing-Japanese commerce and industry club was established here Wednesday at a meeting attended by some 100 representatives of Japanese enterprises and organizations. The club is aimed at promoting contacts among representatives of Japanese firms and business organizations stationed in Beijing, commercial activities and Sino-Japanese economic exchanges. Such functions as lecture meetings and meetings with Chinese economic officials will be held by the club. As of December 1, there were 170 representatives of 101 Japanese firms stationed in Beijing on long-term visas. There are an estimated 400 representatives of 150 firms and organizations if those staying on short-term visas are included. [OW110035 Tokyo KYODO in English 0020 GMT 11 Dec 80]

PRC DRY CELL PLANT--Osaka, 6 Dec (KYODO)--Matsushita Electric Industrial Co said Saturday it will export to China a plant for producing dry cells. The plant, to be installed in Shanghai, will start production in the spring of 1983 with an annual capacity of 70 million dry cells. The company has already concluded contracts on exports of three plants to China, including a color television set assemlby plant, to help the country develop its electronic parts industry. Matsushita is also planning to set up a joint venture with China, it said. [Text] [OW081501 Tokyo KYODO in English 0109 GMT 6 Dec 80]

PHOTOCOPY MACHINE SERVICING--Tokyo, 15 Dec (KYODO)--A medium-sized Japanese trading firm has established a service center for Konishirodu Photo Industry Co's copying machine called "U-Bix" in Shanghai, the first of its kind in China. Tokyo Boeki Ltd said Monday it has taken the step in hopes of increasing exports of such machines now more than 1,000 units since the trading firm started exporting U-Bix in 1976. Konishiroku has the largest share in the Chinese market for copying machines. Tokyo Boeki invested yen 17 million in the establishment of the center which will be manned by 20 Chinese engineers trained in Japan. Tokyo Boeki plans to establish similar centers in Beijing, Guangdong and Dalian in the next fiscal year. The center will be operated by Shanghai Foreign Trade Corp and Shanghai Cinema and Photo Material Industry Corp. [Text] [Tokyo KYODO in English 0331 GMT 15 Dec 80 OW]

BANK CARD SERVICE--Nagoya, 13 Dec KYODO--Million Card Service Co said Saturday it has started a cash advance service which permits each cardholder to borrow up to 1,500 Chinese yuans (some yen 230,000) at the Guangzhou branch of the Bank of China. The credit card firm, a subsidiary of Tokai Bank Ltd, signed the business-affiliation agreement providing for the service on 1 December. Each loan is to be repayed within 55 days from the cardholder's account. Guangzhou is a provincial capital in southern China where trade fairs are held every year. [Text] [Tokyo KYODO in English 0232 GMT 13 Dec 80 OW]

FORKLIFT AGREEMENT--Tokyo, 15 Dec KYODO--Mitsubishi Heavy Industries Ltd said Monday it has concluded an all-inclusive technical cooperation agreement with China's Beijing forklift works for production of small-size forklift trucks. Under the 5-year agreement, Mitsubishi will provide production know-how on forklifts in the 1 to 5-ton class to the works, company officials said. Mitsubishi will also help the Beijing works improve its production facilities and train Chinese technicians at its Sagamihara plant in Kanagawa Prefecture, they added. [Text] [Tokyo KYODO in English 0251 GMT 15 Dec 80 OW]

GUANGDONG SHENZHEN SPECIAL ZONE--Many foreign companies and corporations have submitted applications for opening businesses in Shenzhen special zone in Guangdong. As of 19 October, the departments concerned in Shenzhen received 270 corporations and 350 individual businessmen over the space of 1 month, and signed 19 agreements. Many other agreements will be signed later. [Guangzhou Guangdong Provincial Service in Mandarin 1120 GMT 26 Oct 80 HK]

SHANGHAI IMPORTED GOODS--The Shanghai Commodity Inspection Bureau has strengthened the examination of imported goods into the Shanghai area. According to recent preliminary statistics, in 1979 foreign companies paid compensation of more than 8.3 million U.S. dollars for quality, weight and other violations of foreign trade contracts. [Shanghai City Service in Mandarin 2300 GMT 24 Nov 80 OW]

BRIEFS

GUANGDONG UNEMPLOYMENT FUNDS--The Guangdong provincial finance department has allocated 10 million yuan of capital to speed up the work of finding jobs for the urban unemployed. This has been done in accordance with a provincial people's government decision. This comes on top of the 5 million yuan previously allocated this year for the purpose. The money will be used to support the urban areas in setting up collective-ownership enterprises to provide jobs for unemployed youths, and also to set up enterprises organized by the unemployed themselves. Where these units lack sufficient capital, they can apply for loans to the local labor departments. The loans will in general be for terms of 1 or 2 years and will be interest-free. [Guangzhou Guangdong Provincial Service in Mandarin 1120 GMT 13 Nov 80 HK]

JILIN JOBLESS YOUTHS--In 1979 Jilin Province created jobs for more than 400,000 youths awaiting job assignments. During the first 10 months of 1980, the province employed 160,000 youths. Over the past 2 years, the province has set up 3,290 collective enterprises which provide jobs for 320,000 youths. A total of 17,000 youths have provided jobs for themselves by developing indiviudal economic entities. [Changchun Jilin Provincial Service in Mandarin 1100 GMT 23 Nov 80 SK]

TRANSPORTATION

VOLUME OF SHIPPING IN CHANGJIANG TO DOUBLE IN 10 YEARS

Hong Kong CHING-CHI TAO-PAO in Chinese 29 Oct 80 pp 4-5

[Article: "Chiangjiang Shipping To Be Fully Developed; Interview With First Vice-Minister of Communications Peng Deqing"]

[Text] In a recent interview, Peng Deqing, first vice minister of communications, predicted that shipping along the Changjiang will be fully developed in the coming decade to serve socialist construction. It is estimated that the current volume of shipping along the Changjiang waterways will double by 1990, reaching a total of 500 million tons and surpassing that of the Mississippi River. The volume of freight shipment will increase from 45 million tons to more than 100 million tons. The tonnage of vessels navigating the Changjiang will increase within a decade from 2.5 million to 4 million tons.

According to Peng Deqing, the Changjiang, known as the "golden waterway," is an extraordinary river system with natural navigation potential. Vice Minister Peng believes the Changjiang has at least four advantages:

1. It is our country's largest river, and the main artery of inland waterway shipping. Rising in the Tangula mountain range of the Qinghai-Xizang plateau, it flows through nine provinces--Qinghai, Xizang, Sichuan, Yunnan, Hubei, Hunan, Jiangxi, Anhui, and Jiangsu--before it empties into the East China Sea near Shanghai. It drains an area of more than 1.8 million square km populated by more than 300 million people with some 400 million mu of arable land. Over 6,300 km long, it is the world's third longest river, surpassed only by the Amazon in South America and the Nile in Africa. Over 3,000 km of its course is accessible to ships and lighters. It has 700 tributaries, never dries up or freezes, and is navigable all year round.

2. Its main navigable course covers Sichuan, Hubei, Hunan, Jiangxi, Anhui, Jiangsu, and Shanghai, which are all densely populated and rich in mineral deposits and agricultural produce. There are many big cities along the river dominated by industry, even though agriculture also flourishes. It has access to several major railroads, such as the Beijing-Shanghai, Beijing-Guangzhou, Chengdu-Kunming, and Jiaozou-Liuzhou lines. With abundant commodities for transshipment, extensive utilization of Changjiang shipping is vital to the development of agricultural production in the provinces drained by the river.

3. The Changjiang waterway, which can handle a tremendous volume of shipping at low cost requires very little capital investment and saves energy. A tugboat flotilla on the Changjiang can ship the same quantity as three or four trains. With shipping

costs about one-third of the figure right after liberation, shipping commodities by the Changjiang waterway helps cut down the cost of agricultural production.

4. Staffed with more than 6,000 technical personnel of all kinds and good shipping facilities, the Changjiang shipping service has increased its shipping capacity 12-fold since liberation. All 10,000-ton ships now can sail under the Changjiang bridge at Nanjing all year round. All 5,000-ton ships can sail up to Wuhu and farther up to Jiujiang and Wuhan during the flood season. All 3,000-ton ships can reach Wuhan and Zhenglingji. Years of construction have made all ports along the middle and lower reaches of the Changjiang well equipped for shipping. Zhangjiagang and Nantonggang in Jiangsu have berths for 10,000-ton ships, while the port of Nanjing is equipped to load and unload 10,000-ton ships.

According to this responsible official, the Changjiang Navigation Administration has already established branch offices at Chongqing, Wuhan, Nanjing, and Shanghai, along with 25 port authorities to serve the main waterways. If the Changjiang were utilized to the fullest extent of its superior facilities, it would serve as effectively as 20-30 railroads of equal length. However, due to disruptions by Lin Biao and the "gang of four," the importance of Changjiang shipping had been so downgraded all those years that vehicular transport rather than shipping has been the focal point of interest in communications and transportation construction, while water conservancy instead of shipping has dominated the use of water resources. Moreover, the Changjiang Navigation Administration was far from being sound and efficient. "Feudalist separatism" which segregated various sectors along the waterway has hindered through-shipping between the main waterway and its tributaries on the one hand and between the river and the sea on the other. Weak in business management, the Changjiang Navigation Administration was also short of ships. All these factors have retarded the most effective exploitation of the potential of Changjiang shipping.

Peng Deqing said the State Council will correct the tendency to rate vehicles above ships, roads above waterways, and water conservancy above navigation as it reorganizes the communications system of our country. This will lead to better use of the potential of the Changjiang. Guided by a program "to exploit potential, safeguard competition, and promote concerted action," local initiative and concerted action between central and local agencies will be encouraged in managing shipping along the Changjiang. While enforcing uniform regulations of shipping on the Changjiang, ships of the various provinces and municipalities are allowed to navigate the waterway. This is the only way to utilize the Changjiang river system fully.

It is known that since the State Council opened the ports along Changjiang to foreign trade last February, the S.S. "Yuhua," a seagoing liner of Jiangsu Province, has plied between Nanjing and Hong Kong five times. This helps free imports and exports of Jiangsu from the trouble of having to be transshipped at Shanghai. The China Seagoing Shipping Company's Jiangsu branch, which has ships plying between Nanjing and Hong Kong, is a joint central-local enterprise organized in the early part of this year by the Ministry of Communications and the Jiangsu Provincial People's Government.

On the question of "safeguarding competition and promoting concerted action," he said that to safeguard competition is to promote concerted action and exploit potential in order to develop productivity. Unlike cutthroat competition in capitalist society, this kind of competition under the guidance of state plans is beneficial to our national economic construction. Although we take into consideration local initiative in the development of production, sound economic development requires the kind of competition that bars monopoly by any sector or trade. Apart from ships owned by the Changjiang Navigation Administration, assistance should be extended to shipping on waterways developed by the localities. He said the Changjiang Navigation Administration will organize a foreign trade shipping company, with such provinces as Sichuan, Hubei, Huan, Anhui and Jiangxi as shareholders. The company will be run by the Changjiang Navigation Administration, though any province may subscribe for shares. Dividends, if any, will be paid in foreign exchange to the shareholders. In a word, competition should contribute to the development of the national economy. It must be conducive to concerted action and assistance to local and collective enterprises.

With regard to the expansion of foreign trade by the provinces, municipalities, and autonomous regions, this responsible official of the Ministry of Communications said that the opening of Zhangjiagang, Nantong, and Nanjing in Jiangsu, Wuhu in Anhui, Jiujiang in Jiangxi, Wuhan in Hubei, Zhenglingji in Hunan, and Chongqing in Sichuan to foreign trade last March has made it possible for the exports of all provinces along the Changjiang to go by through shipment to foreign countries or Hong Kong. This has accelerated the movement of both exports and imports. Before these major ports along the Changjiang were opened to foreign trade, exports of all provinces along the river had to be transshipped at Shanghai or by train to Hong Kong. Shipments by train or by boat through coastal ports are always jammed. As a result, there is an annual backlog of commodities waiting to move out. According to him in 1979, the six provinces along the Changjiang exported a total of 3.34 million tons of commodities, and the volume will increase by 50 percent in 1980. The volume of shipments will increase several times between now and 1985.

To foster navigation and shipping on the Changjiang, he said, port construction and administration will be strengthened in the coming decade. Apart from the eight existing deepwater berths along the lower reaches of the Changjiang east of Nanjing, 30 more berths will be built at Nanjing, Zhangjiagang, and Zhenjiang. Major port construction along the middle reaches of the Changjiang will be undertaken at Wuhan, even though ports at Chongqing, Wuhu, and Jiujiang will be built, too. The construction jobs will cover dredging the waterway at its upper reaches, removing shoals which obstruct navigation at its lower reaches, and dredging the estuary where the Changjiang empties into the sea. All mechanized loading and unloading facilities will undergo technological innovations to provide streamlined shipping services. To improve passenger service in order to meet the needs of expanding passenger traffic and tourism, passenger piers and facilities will be built at Wanxian, Yichang, Shashi, Wuhan, Jiujiang, Wuhu, Maanshan, and Nanjing.

NAVIGATIONAL TECHNICIANS MEET IN BEIJING 1-6 DECEMBER

OW070417 Beijing XINHUA Domestic Service in Chinese 1417 GMT 6 Dec 80

[Excerpts] Beijing, 6 Dec (XINHUA)--The conference of representatives of navigational technicians, which ended in Beijing today, pointed out that under present circumstances, it is necessary to further eliminate the influence of left-devisionist thinking and line and promote the development of navigational undertakings by observing China's actual conditions and economic laws so as to make China's navigational undertakings meet the needs of socialist modernization.

The conference was convened on 1 December by the Ministry of Communications. The representatives recalled the development of China's navigational tasks. At present, the number of China's coastal ships is 7.9 times that in 1952; the volume of freight and the number of passengers transported between January and October this year are 11.3 and 30 times respectively over those in 1952.

By now China has more than 400 ocean freighters whose deadweight tonnage exceeds 7 million metric tons. Over 70 percent of China's foreign trade cargo is handled by Chinese freighters. This has changed the situation of China's foreign trade transportation having to rely mainly on rented foreign ships and has drastically cut down on spending the country's foreign exchange. Since China's fleet of ocean freighters was founded, it has delivered dozens of billions of yuan in profits and taxes to the state.

The participants to the conference pointed out that China's navigational undertakings should continue to develop appropriately in the course of readjustment in line with state policy on giving priority to the development of energy, communications and transportation. Therefore, it is necessary to display the spirit of developing undertakings through hard work, actively carry out technical innovations and technical reforms, improve management and administration work and pay attention to safety in production and to energy conservation. Last year, China's shipping departments saved 210,000 metric tons of fuel oil. They saved 200,000 metric tons in the first 10 months of this year.

The conference called on staff members and workers of shipping departments throughout the country to display their wisdom and talent, to study hard, dare to make new inventions and make greater contributions to speeding up the modernization of China's navigational undertaking.

BRIEFS

SHANDONG RAILWAY CONSTRUCTION--Five sets of railroad tracks were laid and opened to traffic recently between Zihedian and Putong stations on the Jiaoji railway in Shandong Province. Multiple tracks between Gaomi and Kangjiazhuang stations are also under construction. [SK271257 Jinan Shandong Provincial Service in Mandarin 2300 GMT 25 Nov 80]

YUNNAN-XIZANG RAILWAY PLANNING--The railway engineering committee of the Chinese Railway Association and the Sichuan Provincial Railway Association held an academic meeting in Chengdu from 12 to 17 November on surveying and selecting the routing of the Yunnan-Xizang railway. Professors, researchers, experts and engineers from 30 units all over the country attended the meeting. The participants discussed how to overcome difficulties posed by blizzards, glaciers, landslides and terrestrial heat along the route, and explored routing schemes and major technological criteria. They also exchanged experiences in progressive survey technology such as the use of lasers. They put forward a number of valuable opinions on future construction and design of the railway. 'GONGREN RIBAO' ON RISE OF WORKERS' LIVING STANDARDS

OW121217 Beijing XINHUA Domestic Service in Chinese 1130 GMT 11 Dec 80

[Excerpts] Beijing, 11 Dec (XINHUA)--GONGREN RIBAO today published on its second page two investigation reports on workers' life in Tianjin Municipality and Heilongjiang Province under the headline "Workers' Life as Seen From Two Investigation Reports." The paper also published an editor's note.

The report "Investigation on Tianjin Municipal Workers' Life" says: The general trend in the life of Tianjin Municipal workers in recent years shows an increase in income, an improvement in living standards and a decrease in the number of families with material difficulties.

The report "Investigation on Workers' Life in Heilongjiang Province" says: Last April, Heilongjiang provincial units concerned conducted a sample survey on the first quarter income and expenses of 12,130 workers' household in Harbin, Qiqihar, Daqing, Hegang, Yichun, Mudanjiang, Jiamusi, Suihua, Acheng and Nehe. The survey shows various changes in family income as compared with 1977. These changes include an increase in people employed, a rise in living standards, an increase in the ratio of bonus and various subsidies causing structural changes in workers' income, an increase in per capita income, a decrease in the number of workers' families in the low income bracket and a slight improvement in housing conditions.

The editor's note says: Since the smashing of the gang of four, and especially since the 3d plenary session of the 11th CCP Central Committee, the party and government have made vigorous efforts to improve the people's life and to seriously fulfill their promises made years ago. With the rehabilitation and development of the national economy, the workers' life has improved. In addition to the improvement of life in general as a result of the government's efforts to build houses, improve transportation and undertake other collective welfare projects, the workers' personal income has also shown increases. The surveys conducted on selected workers in Tianjin Municipality and Heilongjiang Province provide a convincing proof on this.

However, generally speaking, the living standards of the workers in our country are still very low. In recent years the imbalance beween accumulation and consumption has caused increases in commodity prices, especially in the increase of daily necessities, either overt or covered. These increases have caused the decline of the workers' wages in real terms. There are still a considerable number of worker families with material difficulties, and housing shortages are still a serious problem affecting the workers' life. This state of affairs is caused by our country's weak economic foundation, its large population and its backward economy, coupled with the sabotage by the counterrevolutionary cliques of Lin Biao and Jiang Qing, which brought our national economy to the brink of collapse. As a result, many of our promises to improve the people's life have not been fulfilled. Although our economy has taken a turn for the better in recent years, this change is in the nature of recovery. The problems affecting the people's living accumulated over the years cannot be resolved at one stroke, and the steps to improve living standards cannot be too drastic.

The editor's note says: The standard of living is decided by the level of production. An improvement in the standard of living cannot be achieved in separation from the development of production. Improvement in the standard of living and the development of production are mutually complementary and promotive. In the current economic readjustment, our country is resolutely scaling down the capital construction front, reducing the ratio of accumulation and changing past longstanding and lopsided emphasis on the "bone"--accumulation--to the negligence of "flesh"--consumption. The purpose of so doing is to ensure a gradual improvement of the people's living standards on the basis of production growth by correctly treating the relationship between production and living.

The editor's note says: There are many aspects in the workers' life that need improvement. This requires the efforts of all quarters and overall consideration and all-round arrangement. The actual living standards of the people are decided to a great extent by the price of consumer goods. An important condition to ensure against the decline of the workers' living standards in real terms is the stabilization of commodity prices by effective measures. It is necessary to resolutely stop the erroneous practice of seeking to increase profits through price rises instead of through improvement of enterprise management. It is necessary to increase production and lower prices by every means in order to ensure an actual increase in the workers' living standards.

ZHEJIANG HOLDS FIRST ECONOMIC INVESTIGATION WORK MEETING

OW262130 Hangzhou Zhejiang Provincial Service in Mandarin 1100 GMT 26 Nov 80

[Text] According to a report by this station, the people's procuratorates at all levels in the province have conscientiously carried out economic investigation work. From Janaury to September this year, a total of 738 cases of various economic crimes were received for handling, 107 economic criminals were arrested according to law and 270,000 yuan of loot money was receovered. To sum up and exchange the experiences of the various localities in carrying out economic investigation work and in studying the question of how to further carry out in an all-round way the economic investigation work in the new situation, the provincial people's procuratorate recently held the province's first forum on economic investigation work.

The forum pointed out: With the daily development of the socialist economic construction, to safeguard the four modernizations and carry out struggle against criminal activities in the economic sphere have become very pressing and important tasks for the procuratorate organizations. Currently law breaking and criminal activities in the province's economic sphere are still considerably serious, and corruption, bribery, accidents involving important responsibilities, and illegal and unscrupulous felling of trees are relatively prominent. The economic investigation organizations in all localities should persist in seeking truth from facts, be more thorough in investigations and study, strengthen the study of policies and law, study the new situation and solve the new problems. They should use the law correctly, distinguish clearly between the criminal and the innocent and place emphasis on attacking those economic criminals whose criminal responsibilities should be thoroughly investigated.

The forum also called on economic investigation organizations at all levels to actively help all enterprises, establishments and units set up and perfect various systems of economic management to eliminate flaws in rules and regulations. With regard to cadres and masses, it is necessary to educate them to adhere to discipline and observe the law, to resolutely expose and report all criminal activities and to persistently carry out struggle against all kinds of criminal activities in the economic sphere so as to guarantee the smooth progress of the four modernizations.

GENERAL

BRIEFS

ANHUI EX-CONVICT TECHNICIANS--The Jianghuai motor vehicle manufacturing plan in Hefei, Anhui Province, not long ago employed 44 ex-prisoners who had served their prison terms and awaited employment. They are serving as engineers, skilled technicians, assistant engineers and mechanics and are paid as such. The plant was formerly a labor-reform enterprise under the public security department. About a quarter of its 3,200 employees are ex-prisoners and happen to be backbone production workers. Politically and economically, they are given equal treatment with all other employees. The recently employed ex-prisoners support the party's leadership and socialism and are college graduates or are as capable as college graduates. [Hefei Anhui Provincial Service in Mandarin 1100 GMT 20 Nov 80 OW]

QINGHAI MALPRACTICES--QINGHQI RIBAO carried letters from readers on 20 November revealing the (Mafang) flour mill has engaged in malpractices and refuse to correct its ways since 1978. The letters stated that this mill sells low quality flour to markets, sells its best quality flour to its own staff members and workers and covertly sells second quality flour to certain privileged persons. Letters urged departments concerned to deal with this problem and called on the masses to fight against such malpractices as seeking privileges. [Xining Qinghai Provincial Service in Mandarin 2330 GMT 19 Nov 80 SK]

SHAANXI QUALITY RALLY--The Shaanxi Provincial People's Government held a rally in Xian on 18 November to present awards for successes in the 1980 "Quality Month." Hui Shigong, He Chenghua and other responsible comrades of the provincial CCP committee and people's government attended the rally and presented awards and citations. Vice Governor He Chenghua delivered a summation speech. He said that 187 enterprises in the province have now instituted all-round quality control, and many successes have been achieved in improving quality. However, the province still lags far behind advanced provinces and municipalities, and still greater effort is needed to improve product quality. [Xian Shaanxi Provincial Service in Mandarin 1100 GMT 19 Nov 80 HK]

SHAANXI RELIEF FUNDS--The Shaanxi Provincial People's Government has allocated 2.4 million yuan in relief funds and 2 million meters of cotton cloth and 350,000 jin of cotton to help disaster areas and people living in poverty solve their winter clothing and bedding problem. [Xian Shaanxi Provincial Service in Mandarin 2300 GMT 22 Nov 80 HK]

TIANJIN SMUGGLING RING--The Tanggu Branch Office of the Tianjin Customs recently cracked down on a smuggling ring and confiscated smuggled goods, including over 500 wristwatches, 100 silver coins and 4 liang in gold and 100,000 yuan in cash. The 20 smugglers in the ring included cadres, workers, peasants, soldiers, and jobless youths. The ring had been active since 1979 in seven big cities--Guangzhou, Shanghai, Beijing, Tianjin, Wuhan, Shenyang and Mudanjiang. According to a station commentary, in the first 9 months of 1980, smuggling cases in Tianjin increased by 37.5 times over that of the corresponding 1979 period. [Tianjin City Service in Mandarin 0030 GMT 16 Nov 80 SK]

YUNNAN RURAL HOUSING CONFERENCE--The Yunnan Provincial People's Government recently held a work conference on rural housing. The meeting called for efforts to improve rural housing conditions. The meeting summed up past experiences in rural housing construction and arranged for future tasks. The meeting held: rural housing conditions have improved in our province since the liberation, however, peasants still face housing and sanitary problems. Conditions are even poorer in the hilly areas and minority nationalities areas. Thus, we must: 1) Seriously understand the importance of rural housing; 2) motivate activities on the part of the collectives and individuals; 3) seriously promote design of houses; 4) economize on the use of land; and 5) economize on construction materials. The meeting finally demanded that all leaders must strengthen leadership over rural housing construction to change the backward situation. [Kunming Yunnan Provincial Service in Mandarin 1100 GMT 22 Nov 80 HK]

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Indexes to this report (by keyword, author, personal names, title and series) are available from Bell & Howell, Old Mansfield Road, Wooster, Ohio 44691.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

PRC JOURNAL ON REFORM OF COMMERCIAL SYSTEM

HK100252 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 9, 15 Sep 80 pp 31-37

[Article by Fu Shuliao [0265 5771 4229] and Liao Shugui [1675 5771 2981]: "How To Set Out the Reform of Commercial System?"]

[Text] Toward the end of last year, we went to Sichuan Province where, along with the comrades of the Provincial Commercial Bureau, we conducted a fact-finding study on the reform program involving the commercial system. The following is an account of the initial understanding obtained on the problems existing in the current commercial system as well as on the steps of the reform.

Problems Existing in the Current Commercial System

The problems existing in the current commercial system are mainly as follows:

1. Too Many Plan-Controlled Commodities for Exclusive Sale

In 1957, 98 types of plan-controlled commodities were administered by state-operated businesses (excluding medicine) above the provincial level. The number has now increased to 131; besides, each level has expanded the quota to include more plan-controlled commodities at its own initiation so that at the basic level almost all commodities have been put under control. Moreover, almost all commodities covered by the scheme have been taken over by commercial departments for exclusive sale, irrespective of their nature. As a result, industrial concerns only sell their goods to one customer and so the marketing of products does not have any direct bearing on them. As for commercial departments, there is no competition in view of the monopoly they enjoy, goods are distributed to every level from top to bottom, and it is impossible to respond flexibly to demands of the market when making purchases. Therefore, by the time changes occur in the conditions of production and marketing, contradictions between industrial and commercial concerns have become intensified.

Industrial departments also reflect very strong views on the exclusive sale arrangement practiced by commercial departments. For a commodity in short supply, commercial concerns go beyond their purchase quota to take any such commodity in excess of the production target. For a commodity unsuitable for sale, they make their choice and then tell the industrial departments to sell the rest by themselves. Industrial departments feel that this is unfair.

Besides, under the exclusive sale arrangement, industrial concerns can only produce the type of goods which they are advised to produce by the commercial departments, and production of these goods does not always correctly reflect changes in the market. One moment they will say the supply is too much, while the next they will say the supply is too little, thus putting production into a passive state. Commercial departments note, on the other hand, that industrial concerns expand their own sale of commodities in short supply but request commercial departments to take up the sale of commodities unsuitable for the market. As a result, the profit goes to the industrial concerns while commercial departments have to overstock and suffer a loss.

2. Insufficient Channels But Too Many Links for the Circulation of Commodities

In 1957, state-operated businesses and supply and marketing cooperatives were responsible for 60 percent of the volume of sale, while the group of cooperative shops was responsible for 26.8 percent; in 1978, the ratios became 80 percent and 16 percent respectively. As for local industrial products, in 1957, 76 percent of these were purchased by commercial departments and 24 percent were taken up by industrial concerns for their own sale. In 1975, over 92 percent of the same were purchased by commercial departments and it was basically a business monopoly.

As far as circulation links are concerned, there are grade-two centers as well as municipal companies in Chongqing and Chengdu. Chengdu Municipal Company, which is a grade-three wholesale concern, also sells wholesale to the county companies belonging to the municipality, while the county companies even assume the role of an agent and sell wholesale to the rural cooperative shops through the supply and marketing cooperatives at the basic level. As a result, there are several wholesale agents of different grades in a single locality. Some of the commodities produced in Chengdu have to go into the depot of grade-two centers first. They are then transferred to the depot of municipal companies and subsequently arrive at retail units. Having gone through such a process of "three ins and three outs," these commodities finally reach the consumers.

Industrial departments are strongly against the numerous commercial links. They consider that the method of fixing the purchase price of certain commodities by working backwards from the retail price, from which the profit and overheads are taken, imposes upon them the additional illogical expenses brought about by the numerous commercial links. In addition, this method conceals the problems existing in commercial management.

Commercial retail units also complain that there are too many links, but that wholesale units are not very keen on the idea of reducing the number of links. Chongqing Department Store purchases 60 percent of its stock directly from other parts of the country; however, all such purchases have to be settled through the grade-two centers. The Chengdu Municipal Bazaar of the People has tried to establish links with 28 factories, but this method has affected the profits of the wholesale units. The municipal company, therefore, firmly objects to such a method, saying that making purchases from multiple sources is a crooked practice unfavorable to the unified arrangement of the market.

3. Control of Prices Excessively Rigid

In 1957, there were 150 kinds of commodities with their prices controlled by various grades of price control departments above the provincial level; now the number has increased to 477. The prices of commodities at the stages of leaving the factory, allocation, transfer and selling, are for the most part subject to general control so that, basically, departments and enterprises concerned have no rights over the price level. The prices of certain commodities, although not controlled by higher authorities, are fixed in accordance with a schedule or formula laid down many years ago so that in actual fact, the control is even more inflexible than that over the commodities which have their prices assessed for the moment.

The control of commodity prices is extensive and rigid. On the one hand, some commodities are strongly demanded by the market. However, since producing such commodities is unprofitable and it is impossible to readjust their prices, industrial concerns are unwilling to produce these in large quantities. Commercial departments, for the sake of making arrangements for the market, have no alternative but to give up the profits. In Sichuan Province, there are 42 types of commodities whose producer prices are higher than retail prices. In addition, there are 69 types of commodities whose purchase prices and selling prices are so close that the differences are too small to cover the trading costs, thus directly dampening the enthusiasm of the commercial sector. On the other hand, some commodities have their retail prices fixed, from which their producer prices are worked out in the reverse direction by deducting the difference between wholesale and retail prices as well as by taking away the wholesale discount. Since this is out of line with the production costs, it affects the enthusiasm for production and, very often, also affects the supply to the market.

Another manifestation of the inflexible control is that commodities of superior quality cannot fetch an excellent price while prices of commodities having different specifications are the same. Industrial departments note that 18 x 18 cotton cloth, a product which has been awarded the silver medal, is selling at the same price as those products of inferior quality, without fetching one fen more. Leather shoes are fetching the same price for five different sizes; factories are, therefore, only willing to produce small-sized shoes, thus leaving no room for designs and varieties.

4. Lack of Overall Administration for Business Finance and No Decisionmaking Power Allowed for Commercial Enterprises

The existing commercial enterprises are put into different groups according to administration zones for accounting purposes. Although plans for commodity circulation are assigned by commercial bureaus at various levels and plans of commodity distribution are assigned by groups of companies, profit planning is arranged by finance departments at various levels; the three do not link up with each other, which adversely affects the management of enterprises. Besides, the dissected financial system also directly disrupts the organization of commodity circulation according to economic zones. A considerable number of wholesale centers have been set up irrationally. However, owing to limitations of the financial system, it is difficult to have these centers closed or merged.

Commercial enterprises do not have any power to make decisions. Plans involving the purchase, sale, transfer and allocation of goods go from top to bottom through various levels; supply of goods are distributed by higher authorities in a unified manner; prices are fixed by higher authorities; business areas and zones are drawn up by higher authorities; all business profits are turned in to higher authorities; the types and amounts of goods to sell are also decided by higher authorities--such has been the longstanding situation. The business performance of an enterprise does not have any connection with the interests of the enterprise or the staff, nor is there any internal drive or external stress. Longstanding problems involving the management standard of an enterprise, the bureaucratic workstyle in commerce, the attitude toward customers, the standard of services provided and so on are not effectively dealt with.

5. Means of Commercial Management Are Seriously Out of Proportion With Business Development

The business volume of commercial enterprises has been increasing these past few years, but investments made by the state in commerce are decreasing. The commercial network as well as depot and business facilities are getting more and more out of tune with the needs of commodity circulation. In 1962, the business network operated by the Second Commerce Bureau of Chengdu Municipality and affiliated organizations had 10,084 centers. This number was reduced to 1,660 in 1978, an average of 1.4 centers for every 1,000 inhabitants. The loss associated with the rotting of goods arising from inadequate means of commercial management, such as cold storage, depots and so on, is also frightening. During the 13 years from 1966 to 1978, state-operated business in the whole province sustained property losses of as much as 410 million yuan. This amount has not yet taken into account the loss of 10 million yuan each year arising from the dying off of pigs. Staff quarters constitute an even more prominent problem. Since the founding of the state, commercial departments at the basic level have never built any quarters, nor have they been allotted any of the quarters completed under the unified building scheme carried out by the municipal authorities.

From the above, it can be seen that changes must be brought about in the highly concentrated and centralized system of planned management. Otherwise, in the dissected and disconnected organization or structure under which functions of an enterprise are mixed with those of government, as well as in the existing status of enterprises which cannot exercise any power over their own management and construction, it will be difficult to readjust the national economy, to cope with the new situation which has already emerged in the actual economic life since the third plenary session of the party Central Committee, and to attain the aim of revitalizing the market. Therefore, reforming the commercial system is indeed a most urgent task. From now on, it is necessary to set out the reform on the basis of survey and study so that a major reform will be effected through a series of minor reforms and so that there will be no further delays.

Where To Start With the Reform of Commercial System

The Sichuan provincial party committee attaches great importance to the reform of the commercial system. In November last year, when the provincial finance and trade section reported to the provincial party committee on the tentative reform program, the key comrades in charge of the committee expressed their views on many problems. In the main, their views are as follows: (1) In order to reform the commercial system, it is first necessary to put the situation back to that of 1957 in a planned manner, and of course, new conditions must also be taken into consideration. (2) The focal point of the reform is to expand the autonomy of enterprises, reduce the number of commodities under general control and bring about more channels to obtain goods so that the basic level is revitalized before reforming the system on top. (3) Wholesale links must be reduced to a minimum, and the organizational structure must be adjusted in an appropriate manner. Professional companies must first change the three-tiered wholesale accounting system and then adjust the organizational structure. (4) As far as possible, direct factory to shop links for local products must be arranged so as to avoid intermediary links. Commercial departments should go ahead boldly with the reform in this aspect. (5) Attention should be paid to the pricing problem. Stricter control should be imposed in 1980 so that the people's lives are not affected and stability and unity are not impaired. (6) Commercial facilities are very important. The more money that is spent on these, the more losses can be avoided. Speedy action must be taken to improve such facilities. There are three ways to obtain the necessary funds. The first way is to set aside some money in the budget; the second way is to get more money from the portion of profits retained by the enterprise; the third way is to take out some money from the fund allocated for meeting losses. In short, it is necessary to make some arrangements, and not just by relying on finance departments. (7) Industries run by commercial departments should be given financial assistance and advice on policy matters so as to help them stand on their own step by step. It would not be advisable to leave them alone. (8) Commercial departments have to cultivate a new idea, that is, to devote major efforts to promoting the sale of commodities.

Through this survey, we have formed the following ideas as to where to start with the reform of the entire commercial system:

1. Abolish Exclusive Sale System, Improve Planned Management

Under the existing system, all commodities of the first and second categories are for exclusive sale except those for monopolized purchase by the state. This method of putting all commodities up for exclusive sale has quite a few drawbacks. For example, it can neither benefit the production nor the circulation of commodities. In fact, commercial departments simply cannot underwrite the sale of all commodities. It is our view that with the exception of those commodities reserved for monopolized purchase and marketing, which should still be disposed of in accordance with the rules laid down by the state, all commodities for exclusive sale should perhaps in the future be "purchased according to a planned quota." That is to say, the industrial and commercial departments should enter into a contract which guarantees the supply and purchase of a certain number of commodities as laid down in a commodity purchase program assigned by the state. The production program of the industry can be bigger than the purchase program of the commercial department, and there is no need to demand that the two be of the same size. The portion in excess of the purchase quota (including that of increased production) can be sold by the industrial department. In case the industrial department is unwilling to sell the commodities by themselves but the commercial department is willing to make a purchase, then both parties can negotiate a deal. In this way, even controlled commodities will not be completely taken up for exclusive sale, and the production department will then be able to know directly the market situation and improve production. In addition, the improper interference by commercial departments in production matters under the situation of exclusive sale can be avoided.

The varieties of commodities covered by the purchase program should also be reduced step by step as production expands and the situation of supply eases. At present, there is a rule that the money spent on centralized purchase and guaranteed distribution and on ordering commodities must be more than 80 percent of the total cost of purchase. This appears to be a bit too much. In Sichuan, the ratio is to be kept at about 70 percent. We consider that no fixed ratio needs to be made because different regions have different conditions. As for commodities not covered by the purchase program, departments responsible for industry and commerce at the provincial and municipal levels can agree on following some interim guiding principles for industrial and commercial enterprises at the basic level. Based on such principles, the enterprises can make concrete agreements through consultation on the amount of purchase.

The aims of abolishing the practice of underwriting the sale of commodities and improving planned management are to develop production and expand circulation so as to cope with the demands of the market by activating production and circulation. As far as commercial departments are concerned, this does not mean laying down a burden, and as for industrial departments, this does not mean free production. It means rather to carry out better the principle of "combining planned regulation with market regulation, taking planned regulation as the dominant factor while attaching great importance to the role played by the market mechanism." Therefore, it is first necessary to consult with the departments of planning, industry, agriculture and so on to reach a consensus on the steps to take.

2. Simplify the Wholesale Structure and Reduce the Links of Circulation

It is a very prominent problem that commercial setups contain too many links. In order to reform the system, efforts should be made to increase the channels and reduce the links.

In Sichuan Province, grade-2 commercial centers are on the whole established on a reasonable basis. As for grade-3 wholesale centers, more than 50 of them are duplicated establishments which are to be closed or merged. In order to break free from the restrictions of the "dissected system," it is proposed to put wholesale and retail business under separate managements, combine the accounting work of grade-3 wholesale centers in an appropriate way, and carry out management in accordance with the standard of professional companies, starting with the department stores. After centralizing the grade-3 wholesale centers, attempts should be made to insure that the business of retail shops is profitable under normal conditions. This can be done by adjusting the prices of those commodities which do not bring any profit or which only bring losses to retail business because they have not been priced fairly within commercial departments or because there is not much difference between their wholesale and retail prices. After detaching retail business at the county level from grade-3 wholesale business, retail shops of different trades can be established and put under the control of the county commerce bureau. The county wholesale companies will be responsible for wholesaling industrial products to retail shops in county towns, rural supply and marketing cooperatives at the basic level as well as cooperative shops.

The aim of detaching wholesale from retail business and centralizing the accounting of wholesale business is to put grade-3 and grade-2 wholesale business under unified consideration and establish related organizations according to the needs of economic zones so as to achieve the aim of simplifying the wholesale structure and reducing the links of circulation. The following aspects can be taken as the point of departure to foster such a reform:

First, when factories and shops are willing to establish ties with respect to locally produced and consumed commodities, then regardless of whether or not these commodities are controlled, a direct factory to shop link should be encouraged. At the same time, the benefit of allowing wholesale discounts should be retained by the factories and shops involved (wholesale enterprises can still impose certain differential price earnings on controlled commodities) so as to encourage enthusiasm for building such ties.

Secondly, grade-2 centers at the place of production should, whenever possible, supply goods directly to grade-3 wholesale agents at the place of marketing within the same province, without going through grade-2 centers at the marketing place any more. Grade-3 wholesale enterprises should be allowed to purchase the commodities they supply directly to the local area from factories in that area without going through grade-2 centers. This will give rise to some new problems. Therefore, some economic measures should be adopted to help wholesale enterprises solve the problems arising from the change of channels (such as revising the financial commitment and so on).

Third, large and medium-sized cities should establish as quickly as possible wholesale markets for commodities so as to activate the circulation of commodities of the third category.

Besides, the stipulation that shops, supply and marketing cooperatives as well as cooperative shops at the basic level can choose the suppliers which suit their purposes should be further implemented. The method of applying the wholesale practice to anyone who contacts the wholesale source can also be considered for the supply of any commodities with the exception of controlled commodities which are dictated by the practice of planned distribution so as to facilitate launching the direct supply of goods.

3. To Reform Administration of Commodity Prices

The administration of commodity prices should basically be consistent with the planned management of commodities in continuing to implement the principle of unified leadership and classified management as well as in adopting the following three pricing patterns: (1) Fixed pricing, otherwise known as planned pricing: The purchase and marketing prices are laid down by the departments concerned of the state. The same price is laid down for similar commodities of the same quality within the same market. As for new products which have been produced on a trial basis, the production unit can fix a price according to the cost or agree upon a price with commercial departments and refer it to the leading department for approval. (2) Marginal pricing: Industrial products purchased by the state and agricultural byproducts going on the market after the quota for state purchase has been fulfilled are fixed. The highest and lowest purchase prices as well as the highest marketing price are fixed jointly by the provincial leading departments and the price committee. The prices can only be varied within the stipulated margin. This is another form of planned pricing. (3) Uncontrolled pricing: All industrial or agricultural products not covered by the two areas of pricing administration mentioned above have prices fixed by the enterprises concerned, and transactions of such products are concluded at a price agreed upon between the parties of purchase and sale. Products purchased at a high price can be sold at a high price, while products purchased at a low price can be sold at a low price according to market conditions.

The limits of authority to administer prices should be transferred to a lower level in an appropriate manner. Take as an example the market selling prices of commodities, among which 32 types are under departmental administration or above, while 34 types (including 4 types of nonstaple foodstuffs and 30 types of industrial products) should be put under the administration of localities. In addition, 68 types are under provincial administration while 86 types (including 23 types of nonstaple foodstuffs and 63 types of industrial products) should be put under a lower administrative level.

Administration of the price range charged by the catering services trade should be more flexible. In the case of the catering trade, attempts can be made to stipulate only the overall gross rate and classified gross rates. Enterprises should fix their own prices provided that they stick to the gross profit rates. As for the repair services trade, the criteria for the maximum charges can be stipulated according to different grades of the trade under the principle of "supporting a trade with the incomes of the trade." Enterprises should fix by themselves the specific charges within the stipulated ranges.

However, the pricing problem involves a very broad scope. The reform in this respect has to be carried out according to policies and stipulations laid down by the state.

4. Develop Collective Business and Manage Cooperative Shops Properly

Many problems exist in the management of cooperative shops. The main ones are: (1) There is no guarantee on the volume of goods a shop can stock. The shop can just trade on whatever volume the wholesale department of the company supplies. (2) There is a heavy burden imposed by high tax rates. In comparison with handicraft industries, cooperative shops are subject to a lower starting point on the tax scale and higher tax rates. For a similar amount of profit, the tax charged is 30 percent more than that imposed on handicraft industries. (3) The number of retired workers or workers on sick leave is enormous. On the average, two active workers have to support one retired worker or worker on sick leave, and some enterprises cannot afford the expense. (4) The business premises are dilapidated. (5) The control over cooperative shops is even stricter than that over state-operated stores; enterprises cannot make their own decisions on such aspects as purchase, sale, employment of capital, disposition of commodities, wages and rewards and so on.

To manage cooperative shops properly and develop collective business is a major policy in forming the channels, in activating the interflow of commodities between cities and rural areas, as well as in promoting prosperity in the socialist market. To counter the above problems, the solutions are proposed:

First, the leadership over collective business should be strengthened. Commercial departments at various levels should have the regular organizations and staff to specialize in providing solutions to problems relating to collective business.

Second, administration and management departments of industries and commerce in various towns and counties should approve the range of business according to the demands of the market. State-operated companies should treat every shop equally without discrimination when allotting commodities; besides, cooperative shops should be allowed to organize part of supply of goods by themselves. Rural cooperative shops should in principle get their stock directly from wholesale companies.

Third, appropriate reductions in the rate of profit tax imposed on cooperative shops should be made.

Fourth, overall planning in settling the expenses for retired workers should be done. It is recommended that workers' retirement funds be established from which centralized payments in proportion to the wages can be made to meet the expenses of retirement pay incurred by state-operated and cooperative business.

Fifth, separate collective enterprises, each having an independent accounting system and assuming sole responsibility for its profits and losses, should be organized for the newly recruited job-seeking youths. Temporary attachments should not be allowed in collective business. This should not be taken as a transition stage leading to formal employment for the job-seeking youths. Such an arrangement will facilitate the strengthening and development of collective business.

5. Expand the Power of Decisionmaking of Commercial Enterprises

Last year, the commercial departments and affiliated organizations in Sichuan Province carried out an experiment in 40 units to expand the decisionmaking power of commercial enterprises. This year, the experiment is to extend to 100 units. In addition, in the four cities of Chengdu, Chongqing, Zigong and Dukou, another 50 enterprises (including 40 retail enterprises and 10 trade warehouses) were chosen to carry out on a trial basis the method of paying a profits tax instead of turning in profits to the state and the method of assuming sole responsibility for profits and losses.

Expanding the decisionmaking power of enterprises means primarily to expand the power to stock goods and to expand the financial power to a certain extent, particularly to reserve some money from the excess profits for the three special funds of an enterprise, by sticking to the principle that the state should get more while an enterprise should get less. This will be conducive to integrating the interests of the state, the enterprise and the workers, to overcoming step by step the shortage of the means of business management and of welfare facilities for the workers, as well as to bringing into play the initiative of the workers. However, it is an essential prerequisite to fix the marketing and profits programs for the year in a rational manner. Three ways to fix the profits program of enterprises in the year 1980 were raised while conducting the study in Sichuan. One is to add the planned profits of 1979 to the actual performance and then divide by 2. The next is to add together the actual performance of the previous 3 years and then divide by 3 to obtain a base, which is fixed for several years with an increase of 5 percent for each successive year. The third is to assess the capital profits rate. All these methods can be carried out on a trial basis.

ECONOMIC JOURNAL DISCUSSES ECONOMIC REGULATION

HK090548 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 10, 15 Oct 80 pp 3-8

[Article by Xue Muqiao [5641 2550 2890]: "Regulation by Planning Mechanism and Regulation by Market Mechanism"]

[Text] Why is the integration of regulation by planning mechanism and regulation by market mechanism necessary in a socialist economy? What is the relationship between regulation by planning mechanism and regulation by market mechanism? How should they be integrated? These are important theoretical and practical questions on which research has just begun. Here I would like to advance my personal views that still need continuous development and supplementation.

1. Why is the integration of regulation by planning mechanism and regulation by market mechanism necessary in a socialist economy?

A socialist economy is built on the basis of enlarged socialized production, which requires the full development of a commodity economy as its prerequisite. A capitalist or socialist economy can develop on the basis of enlarged socialized production. In our cities, a commodity economy may be said to have developed. But with the exception of a few big cities, enlarged socialized production has not yet reached a level of high concentration, one where people share out the work and cooperate with one another. A commodity economy has not been fully developed in our vast countryside and a natural economy still prevails. It is therefore necessary for our country to energetically develop a commodity economy and enlarged socialized production on the basis of developing a commodity economy. At the present stage our socialist economy is the kind of commodity economy which is based on the two socialist public ownerships (led by ownership of the whole people) of the means of production and which allows the coexistence of many economic sectors. This is different from the commodity economy under the system of capitalist private ownership.

The commodity economy has evolved through several stages: the small commodity economy, the capitalist commodity economy and the socialist commodity economy based on public ownership of the means of production. On the one hand, because the means of production are owned by the public, it is necessary and possible for us to conduct planned management of the national economy. On the other hand, we still have to develop a commodity economy and enlarged socialized production. It follows that use must be made of regulation by market mechanism.

In the past 30 years, most of the arguments in the academic circles centered on the commodity economy and the law of value. The socialist economy has been a subject for discussion and debate for more than 100 years since the time of Marx. Marx, in "Critique of the Gotha Program" mentioned that socialism was the initial stage of communism and there had to be traces of capitalism. The traces he referred to were distribution according to work. Marx assumed that there could be no commodities or currencies in socialism, but the socialism he conceived was built on the basis of a highly developed capitalism. He did not conceive of a state constructing socialism where capitalism was only moderately developed and which has just begun to develop capitalism as is the case in China where the small commodity economy and even the natural economy prevail. In "The State and Revolution" the views of Lenin were basically those of Marx. In the early stage of the October Revolution, the Soviet Union adopted the system of wartime communism, trying to abolish the relationship between commodities and currency, but to no avail. Summing up the experience of wartime communism, Lenin explained that much of the small commodity economy still existed then, and, in addition to maintaining the relationship between commodities and currency, commerce had to be developed, bringing into full play the important role of commerce. Yet he did not mention whether there would still be a commodity economy after socialism was reformed. Following collectivization of the Soviet Union's agriculture, Stalin pointed out the coexistence of the two socialist public ownerships in a socialist society. At the same time, there was the working class and the peasantry and there had to be exchanges. But no mention was made as to whether the exchange between the two socialist public ownerships referred to that of commodities and whether the law of value had to be utilized. Since then there has been prolonged argument as to whether the exchange between the two socialist public ownerships referred to the exchange of commodities. It was not until Stalin's later years when the article "The Socialist Economic Problems of the Soviet Union" was published that the existence of the exchange of commodities between the two socialist public ownerships was confirmed. Hence the law of value had to be utilized. Thirty years after that, however, the Soviet Union has not been able to come up with a satisfactory answer as to whether commodity exchange exists in a socialist economy. Consequently, neither the law of value nor the market was fully utilized. Stalin's system of economic management was not conceived in the context of a commodity economy, but in that of a natural economy (self-sufficiency, planned production and distribution within the entire society). Things were not done according to the principle that products were commodities and that exchange should be conducted at equal value. Rather, the socialist economy was treated as an inseparable whole and the relative independence of enterprises was not recognized. In his remaining years, Stalin summed up the 30 years' experience, formally recognizing that there was such a thing as commodity exchange and that the law of value was still functioning. But in the same book he said it would be wrong to think that the law of value had a regulatory effect on the production of agricultural raw materials, because agricultural produce was produced in accordance with plans conceived by the state which fixed all the prices of agricultural raw material. Hence the requisition price for agricultural produce then set by the Soviet Union seriously violated the law of value.

Would there be exchange of commodities after the transition from collective ownership to ownership by the whole people? This Stalin did not say and the question later became our bone of contention. In 1959, there was heated argument at an academic seminar in Shanghai. There were roughly three ways of viewing it at the time. The first was that there was no exchange of commodities within socialist ownership by the whole people. But this was the opinion held by only a handful of people. The second was that consumer goods sold by the state to the staff and workers were not commodities and opinion differed greatly. Two articles were published in RED FLAG at the time. One of them was written by me, acknowledging that consumer goods were commodities, while the other said that since labor force was not a commodity, consumer goods sold by the state to the staff and workers were not commodities. At a study conference held in Hainan Island in 1959, Comrade Liu Shaoqi said that there would be an exchange of commodities as long as there was distribution according to work. Arguments over this question went on until the early 1970's. In 1972, the "Political Economy of Socialism" compiled and published in places such as Shanghai still insisted that consumer goods were not commodities. The third way was that, as far as exchange among the state-run enterprises was concerned, Stalin said only the outward appearance of the commodities remained. This was what most of us thought, too. Yet there was just a little question. In my article I mentioned that, while the entire state was an owner, economic accounting was necessary among enterprises, so was exchange at equal value which should be done by adopting the form of commodities. Looking from this angle, we might say that there was an exchange of commodities to a certain extent. It was not until the recent augmentation of the autonomy of enterprises that the exchanges among enterprises were confirmed to be exchanges of commodities. A state-run economy is owned by the whole people. Yet, in spite of this, united production and distribution were not possible throughout society and the country. The management system of "eating from a big pot" treats socialist ownership by the whole people as an absolute entity and does not recognize that each and every enterprise in this entity is a cell with independent vitality, that there must be relative independence and that exchanges of commodities are necessary among enterprises. To manage enlarged socialized production, this management system uses the ideology of the natural economy. To solve this problem theoretically, we have to analyze the structure of the socialist economy. To maintain the initiative, creativity and enthusiasm of enterprises in the socialist economic entity, relative independence is essential and the enterprises must assume sole responsibility for their profits or losses to a certain extent. In addition, there must be a little competition among enterprises.

When we carried out our First Five-Year Plan, the economy was managed according to the Soviet pattern. At that time, because of the existence of such economic sectors as capitalist commerce and industry and the individual economy, extensive use of the market had to be made. As capitalist commerce and industry and individual economy were all independent economic structures, we had to guide and organize them through the market. We also had to establish contact with them through commercial departments and placing orders for processing materials or supplying manufactured goods. As for agriculture and handicrafts, we also made use of the law of value through the market to guide and organize them. By means of the market, we were in contact with private capitalist commerce and industry, individual agriculture and small-scale handicrafts. Then enlarged socialized production began to develop in our major cities. These cities formed naturally into economic centers according to the needs of economic relations. They are in direct contact with one another and form networks without having to be subject to restrictions of trades and districts. Cities such as Shanghai, Tianjin and

Guangzhou can have direct connections with other medium and small cities and do not have to be subject to the restrictions of divisions of administrative districts. But after the transformation of socialism, which was then adopted across the land, the effect of the market was canceled because of the state monopoly for purchasing and marketing. Though there was exchange of commodities in form, because of the system of "eating from a big pot," no one cared whether they made profits or losses. The production autonomy of the socialist collective economy was also basically rescinded. The whole country was divided into departments and districts, destroying the existing commercial connections. In the past, direct connections were possible among production, supply and marketing, but now things have to be run by departments and districts. In the days of old China, Yizhong Tobacco Company linked together the cigarette factories in Shanghai and Qingdao and tobacco leaf-producing areas such as Xuchang in Hunan, Fangzi in Shandong and Fengyang in Anhui, making supply, production and marketing a coordinated process. But now the tobacco industry is managed by two departments (industry and commerce) in five districts. Consequently supply, production and marketing are completely dislocated. Small tobacco factories are opened in tobacco leaf-producing areas and the big factories do not get sufficient raw materials. Such unreasonable phenomena show how our management system is a unitary administration which does not meet the requirements of enlarged socialized production. In the city of Wuxi, many old retired workers from Shanghai run quite a number of commune-team industries. They go it alone, secure orders for supplying manufactured goods to big factories in Shanghai and are trusted by Shanghai as far as their products are concerned. When the commune-team industries were to be brought in line with the state plan in 1978, these enterprises were all supposed to be incorporated into the plans for the county of Wuxi. Under the management system, contacts with places outside the province could only be made through Nanjing, Jiangsu Province. If this had had to be complied with, not only would the planning department have found it difficult, but the commune-brigade enterprises would not have been able to survive, either. In 1979, the situation deteriorated as the mechanical industry did not get enough assignments. But later when they were allowed to please themselves in securing orders for the supply of manufactured goods, Shanghai, departments under the party's Central Committee and the State Council and other provinces all approached them in Wuxi for contracts. As a result, instead of being reduced, production was increased by more than 20 percent as compared with 1978. At present, many of the big mechanical factories are trying to find ways for themselves to secure orders for supplying manufactured goods which are not included in the plans. The profits are rather handsome despite orders for small batches with less output value. In the past, we discarded the naturally formed economic connections that suited enlarged socialized production, thinking that they were contrary to objective economic law since they had not been brought in line with the state plan. It was not until last year that this convention was thrown to the wind and the economic connections were strongly advocated by the new media. But because the rules and regulations were not amended in time, the "reasonable but unlawful" situation still existed. We used to adopt the system of state planning which undertook all the production and marketing. This definitely is not going to work. It would suffocate the economy. We have tens of thousands, even hundreds of thousands of product varieties and only a few hundred or a few thousand of them have been brought in line with the state plan. We have to admit that they have the right to be related to one another through the market. Except for a few products that need planned purchase and supply, enterprises should be given a free hand to engage in the production and exchange of commodities not included in the state plan, and to link them together through the market. The practice of the state controlling all the income and expenditure and a state monopoly for purchasing as well as marketing regardless of the economic effect, causing dislocation between production and demand, must be changed. A question was raised last year: How can our production be made to suit the demands of the market? During our visit to the United States last year, some comrades put this question to the American professors, who were rather amazed. They felt that, if there was no demand in the market, why keep on producing? Wouldn't halting production solve the problem? They did not realize this has been a major problem in our management system for the past 20 years or more.

Now we must go on with the reform of the system and give enterprises more autonomous powers, making them relatively independent economic entities which, after complying with the requirements to turn over to the state part of their profits, should assume sole responsibility for their profits or losses. As a first step toward achieving this goal, we started to divide up the profits in 1979. But many difficulties were involved in carrying out this method, and there were many disputes. I am afraid that in future we would have to pay tax rather than turning over part of the profits to the state so that these problems might be solved. The state sector of the economy is not the same as the collective economy. Generally, the state sector of the economy has to guarantee that 60 percent or even more than 80 percent of the profits go to the state in the form of taxes. Then it assumes sole responsibility for its profits or losses after turning over part of its profits to the state.

At present, there has been a breakthrough in production and marketing according to plans. After carrying out the state plan, industrial departments are allowed to produce things in accordance with the market demand. As for marketing, except for a few important commodities, commercial departments can make selective purchases. What the commercial departments do not buy, the industrial departments themselves may sell. In this way, selective purchases on the part of the commercial departments and the selling on the part of industrial departments are integrated. Industrial departments can assume production and marketing of some of the small commodities. Alternatively the commodities can be sold to retailers direct, bringing into full play the regulatory effect of the market. In the past, neither the industrial nor the commercial departments cared about which commodities sold well and which did not. All they had to do was to produce and purchase in accordance with the state plan. The situation changes with regulation by market mechanism. The commercial departments no longer purchase products kept in stock for a long time. Instead, they buy more products that are in short supply to meet demand. Under the circumstances, factories have to produce less products of which there is a glut and more of those in short supply. Previously there were purchasing agents all over our country while salesmen were found everywhere in other countries. Last year we began to have salesmen too and advertisements began to be printed. The situation where some commodities are kept in large quantities for a long time while there is an acute shortage of some other commodities has improved.

Following the augmentation of the autonomous powers of enterprises on an experimental basis, the prices of many products are obviously out of keeping with their value, causing differences in the percentage of profits due to trades and enterprises. Consequently, some are happy and some are not. Similarly, because of unreasonable prices, some products which are in excessive supply are still being produced as they can be sold at high prices for big profits. However, trades and enterprises are unwilling to produce some of the products that are in short supply because of the low prices these products have to be sold at. This is a serious problem. To solve it completely, the system of prices for all products being set by the state must be scrapped. Except for a few major products, the production and marketing departments can negotiate an agreed price. As the supply of many products is unable to cope with the demand, it is hard to adopt the proposed system generally. But from a long-term point of view, it is impossible for the state to set the price for hundreds of thousands of products and sound use must be made of the regulatory effect of the law of value.

The problem of the labor system is also very serious. For many years, the labor force in the cities has been arranged by the labor departments and no one has been allowed to solicit help on their own. Consequently, more and more young people are awaiting employment. This is becoming a hard nut to crack. The problem of many factories being overstaffed is one that no one can handle. But there are too few staff and workers in banks, shops and other service trades, adversely affecting production and services for the people. Thus we have a situation where there is a shortage of workers on the one hand and yet there are a great many people who are jobless on the other. Some units are staffed with people who do not want to be there while others who do are rejected. Posting also creates a difficult problem. A large number of technicians cannot apply what they have learned and the scientific knowledge they spent years and years acquiring has not been utilized for the benefit of the country. As to the question of employment, meetings have been held at labor departments to discuss it. Two solutions have been suggested: employment arrangements should be made by the labor departments while young people wishing to be employed should look for jobs by themselves. Factories should have the power to decide for themselves in recruiting workers, and so should the people who wish to be employed. Besides, these people should be allowed and encouraged to solicit help in finding employment while the state should guide and assist them.

2. How should regulation by planning mechanism and regulation by market mechanism be integrated?

A socialist economy must have planned management. All production and the livelihood of all the people depend on the planned arrangements of the state. But this kind of planned management must be administered to a fairly large extent through regulation by market mechanism. If both planned management and regulation by market mechanism are necessary, how are these two to be integrated? What is the relationship between them? These are complicated questions. Our thinking in this respect differs from that of the Soviet Union and Yugoslavia. The Soviets still lay stress on regulation by planning mechanism. This is because they are engaged in an arms race, their construction scale is too big and many of their products are unable to satisfy demand. When demand exceeds supply, state planned distribution becomes necessary. Regulation by market mechanism is overemphasized in Yugoslavia, and it seems that their state plan does not exert much control. Their federal government does not do any capital construction investment, all of which comes from enterprises or joint ventures by enterprises. There is little the Yugoslav state plan can control. Every enterprise wants to increase production and the scale of capital construction expands freely. At the same time, every enterprise wants to improve the living standard of its staff and workers and the purchasing power of the society is also expanding freely. The total of accumulation and consumption far exceeds national income, thus leading to serious inflation. Now the Yugoslavs are examining the situation and action is being taken.

According to our 30 years' of experience, what should the state control? The first thing to control is the scale of construction. The second is the extent to which the people's living is to be raised. There should be an overall plan for economic construction and the people's livelihood. How much of our national income is going to be used in economic construction? How much of it is going to be used in improving the people's livelihood? There should be plans for all these aspects. For the last 30 years, our economy has been at fault just because the ratio between accumulation and consumption was not well monitored. Things were all right during the First Five-Year Plan period. For the Second Five-Year Plan, Premier Zhou's proposal was intended to arrange production and construction on the basis of overall balance. Had construction been carried out in accordance with Premier Zhou's plan, there would definitely have been no violent fluctuations. Production would have increased steadily and the living standard of the people would have continued to rise. In our socialist country, we all want to see faster production development, but then the construction scale would be enormous. During the 3 years of the "Great Leap Forward," everyone was called upon to tighten their belts, engage in construction and carry on a bitter struggle to put an end to the backwardness in 3 years. Consequently, because of the excessive construction scale and accumulation rate, not only was the people's livelihood affected, but also the development of production was hindered. Agricultural production decreased in 1959-1961, as did industrial production in 1961 and 1962. According to our 30 years' experience, fast development is possible at an accumulation rate of about 25 percent or a little more with our existing production level. Once the rate exceeds 30 percent, dislocation of ratio will occur and production will drop when the rate reaches 40 percent. As no summing up of experience was possible (once you sum up, you are against the "Great Leap Forward"), the idea that production should be developed at great speed which in turn necessitated a high rate of accumulation and bigger construction scale was pursued for all these years and was not corrected. From 1970 onward, the accumulation rate exceeded 30 percent every year. Consequently, there was no way the people's livelihood could be improved and there was a shortage of supply on the market. After the crushing of the "gang of four," we should have recuperated, multiplied and readjusted the dislocated ratio. However, another "Leap Forward" took place in 1978 and the accumulation rate reached as high as 36.5 percent, showing clearly that the ratio had been dislocated. Readjustment was faster this time under the policy of raising the living standard of the people and reducing the scale of capital construction. In criticizing the ultraleftist line in the villages in 1978, the two "doing things on a big scale" were stopped, and the policy of recuperating and multiplying adopted. Agricultural production increased substantially. In 1979, agricultural production again increased by a large extent following the raising of purchasing prices for agricultural products. The peasants' livelihood was greatly improved, too. Even peasants eating resold grain are earning more and their living standard is improving because household sideline production and enterprises run by commune brigades have developed. Forty percent of the staff and workers in cities were promoted in 1977, another 40 percent also got promoted in 1979 (many units did not conduct any promotion exercises until this year because of the difficulties in grading). Furthermore bonuses were awarded. The policy laid down last year to reduce accumulation and increase consumption is absolutely correct. In the course of its implementation, consumption was increased by 10 billion yuan, exceeding the plan by approximately 4 billion yuan. Much of the target to cut down capital construction by 9 billion yuan fell through because the plan came too late. At the same time, as the local construction scale got bigger, the investment total was just a little more than last year. With consumption exceeding what was planned while accumulation was not reduced as much as it should have been, there was a financial deficit. This year, consumption is not going to fall. Instead, it will further increase. The price of a few agricultural products will have to be readjusted and increased a little because the payment of most of the increases in wages last year was deferred until this year. The debts we have owed for more than 20 years should be paid back. As a matter of fact, not enough has been repaid, but already the state is shouldering a very heavy burden. So for the next couple of years, advance cannot be too great.

When we were discussing the aim of production last time, some comrades said that since we had all been engaged for decades in the field of economy, how could we not know that the aim was to improve the people's livelihood? I told them we knew that all right, but we did not do it. Our average rate of increase in industrial production was 11.2 percent from 1952 to 1978. Except for Japan which at one time had a production rate of over 10 percent, no other capitalist country had such a high rate of increase--those whose rate of increase reached 5 to 6 percent would be considered as having a high rate. Despite our high rate of increase in production, our people's livelihood has not improved much since 1957 because of excessive accumulation and the low economic effect of production. So what the aim of production is remains a question without an answer.

On the other hand, though the state has only repaid a small part of the debt owed to the people as far as their livelihood is concerned, the burden the state has to bear is already very heavy. Many say that it is wrong for the people's living standard to be raised in excess of the country's capability for production. I disagree. Debts are debts. They have to be repaid and when we do, naturally consumption will increase. Inevitably there will have to be a few years in which a little more of the products are consumed than accumulated. It is only when consumption exceeds accumulation that debts can be repaid. But it would be difficult if we want to repay more. The people will understand if we honestly explain to them the difficult situation the state is in (a concrete indication is that we are now suffering from a great financial deficit). The relationship between capital construction and improvement of living standards must be grasped. The increase in national income over the next few years should mainly be used to improve the people's livelihood, including to build more domestic premises. The scale of economic construction must no longer be increased.

It appears that the total of accumulation and consumption must be strictly controlled by the state plan, while the state must control the total of investment in capital construction. Once the investment total has been decided, the state should also be responsible for the management of many major construction items, not the local authorities or enterprises. As for the small and medium items, particularly tapping potentials, innovations and reforms, money from banks and funds kept by the local authorities and enterprises themselves can be used. Under the existing circumstances, it would be better if investment from funds allocated by the state could account for 50 to 60 percent of the total investment. From now on, the banks should be brought into full play and we should not depend entirely on funds being allocated by the state. I wonder if major items could be financed with financial allocation (which should also be made through construction banks charging interest), and small and medium ones with bank loans. Banks can be asked to share a little of the financial burden, finance some of the investment and make loans. In raising a loan, one would have to pay back the principal plus interest. Hence enterprises would calculate carefully and budget strictly, thus saving more money than acquiring funds through financial allocation.

There are some products the state would do well to interfere with less or not at all, so that enterprises can be directly responsible for both production and marketing. Directive plans such as those for cotton cloth and steel products are necessary. But the production and marketing parties should be allowed to negotiate the varieties, specifications, design and colors, and draw up purchase plans according to the needs of the market before mapping out production plans based on the purchase plans. This method can be more flexibly applied to many articles of daily use. Enterprises can even produce and sell small commodities for local sale, or factories can sell the commodities direct to retail shops. The state lays down the target for reference and the enterprises will see to the rest. At present, with the demand for quite a number of products exceeding supply, the state directive plan can only reduce in size gradually. When the problem of the dislocation of the natural economic ratio is basically solved and production and demand are balanced, directive targets may be reduced to a minimum. The state provides enterprises with targets for reference and information relating to the market and to guide the direction in which the production of enterprises should develop. A concrete method of guidance is to make use of the economic lever: price policy, taxation policy and readjustment of bank credit, and so forth. In this way, the market will be stimulated, and the production of enterprises will meet the demand of the market.

Formerly it was thought that if you carried out regulation by planning mechanism, you would not be able to carry out regulation by market mechanism. This is wrong. The two should be used simultaneously. Much of the regulation by planning mechanism is conducted through regulation by market mechanism. The balance between supply and demand in the market is then guaranteed. However, regulation by planning mechanism and regulation by market mechanism does not mean that some products need regulation by planning mechanism and others need regulation by market mechanism. Regulation by planning mechanism is conducted for many products through regulation by market mechanism.

What everyone is most concerned about is the price, which plays an important regulatory role. As the system of "eating out of a common pot" was practiced in the past, nobody cared about making profits or incurring losses, and the incongruity between price and value got greater and greater. The situation of production is always changing. For instance, agricultural and mineral products are subject to the restrictions of natural conditions. It often turns out that the more they are produced, the greater the cost will be. On the other hand, the more the processing industries produce, the lower the cost will be. The price of a great many products has not been readjusted for a long time. Prices have been frozen for a period of 12 years since the "Cultural Revolution." Profits from products of processing industries get bigger and bigger while those of agricultural and mineral products and the raw materials industry become smaller and smaller. Consequently there are more and more of those products that are already in excessive supply and less and less of those in short supply. The imbalance between the production and marketing of products is also deteriorating.

From now on, the departments responsible for fixing prices should readjust prices according to the law of value. In my experience as chairman of the price committee for several years, it was impossible for the departments to fix all the prices according to the law of value. With hundreds of thousands of products, do you think you can calculate all the costs correctly? After the cost has been calculated, the production departments say the price is too low while the consumers complain that it is too high. As a result, no final decision can be taken and the matter drags on for years. This is really absurd. The mechanical processing industry has suffered considerably from the adverse effects of this kind of planned price system. While the sale of spare parts and replacements brings great profits, the cost of assembling machines is high. At the moment, the Shanghai Mechanical Company is adopting the system of coordinated price. It reduces the price for the spare parts and replacements so that the profits thus obtained are generally the same as those made through assembly of the machines. A coordinated price is spontaneously fixed by the law of value. This used to be unlawful. But the validity of a coordinated price must be recognized now. This price is more reasonable than a planned price. It seems to me that in future, readjustment of planned prices can be effected by studying the coordinated price. The state cannot be depended on to fix the price for hundreds of thousands of products. The production and marketing departments should be allowed to consult each other as to how prices should be set. Some comrades say this would lead to chaos and soaring prices. I do not think it would. Presently mechanical products are not selling well. Through regulation by market mechanism, their price would definitely reduce rather than increase. Some steel products are overstocked and some are out of stock. If the system of regulation by market mechanism were adopted, price reduction and increases would probably be roughly the same. Furthermore, when the prices of these products are readjusted, it only means that money would go from one hand of the state into the other, as enterprises, be they producing or in need of the products, are all owned by the state. It would not affect the stability of prices in the market. Neither would it affect the balance between revenue and expenditure. There is an objective law regarding the increase and reduction of prices and the fact that prices do rise and fall is attributable to the role played by the law of value. Prices rise generally because the currency is devalued. All the state has to do is to control the amount of currency issued and use the law of value to readjust prices, and there will not be a general rise in prices. Regulation by market mechanism will not be brought into full play without readjusting prices. But at present the purchasing and selling prices of some important means of livelihood (for example, foodstuffs and edible oil) are coupled together. Any readjustment will affect the livelihood of the people. So the prices should not be readjusted for the time being, that is, not until the state is able to raise wages by a great percentage. In the meantime, any loss should be subsidized by financial departments of the state. To effect a general readjustment of prices now is still difficult. Before the state's vitality has completely recovered, it is not fit to undergo too big a shake-up. Therefore, the price of those commodities (mainly means of livelihood) that would not affect people's livelihood very much and the revenue and expenditure of the state can be readjusted sooner. Special care must be taken in readjusting the prices of important means of livelihood. The direction of reform is positively correct, but we must progress steadily. When the final readjustment of prices is completed and reform generally finished, our economic situation will be very different.

'JINGJI GUANLI': PROMOTE INTEGRATION, COMPETITION

HK070649 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 10, 15 Oct 80 pp 17-20

[Article by Ma Hong [7456 3163]: "Integration and Competition in Socialist Economy (1)"]

[Text] The principle of "taking advantage of superior features, protecting competition and promoting integration" put forth by the party Central Committee is an important principle for building socialism. To correctly understand and implement this principle is of great significance for readjusting the national economy, restructuring the economic management system, combining regulation by planning mechanism with regulation by market mechanism and speeding up economic development and the construction of the four modernizations. This article mainly deals with questions of integration and competition.

(I)

Economic Integration May Become a Major Organizational Form of National Economy

A very important task of socialist society is how to organize well the national economy so as to attain the best economic results with least labor consumption.

Lenin pointed out that the road of organization is long. The organizational form of a new society can be created only through practice. These words of Lenin are applicable to socialist transformation as well as to socialist construction.

Though our economy is still very backward, it has a certain foundation after 30 years of development. At present our country already has 355,000 industrial enterprises, including 83,000 under ownership by the whole people and 271,000 under collective ownership. Industrial departments include 104,000 machinery industrial enterprises, 22,000 chemical enterprises, over 5,100 metallurgical enterprises, over 8,900 electric power enterprises and over 46,000 construction building material enterprises. In addition, there are 1.46 million commercial and service units, 1.48 million enterprises of the people's communes and production brigades and 16,000 state agricultural, forestry, pastoral and fish farms. But not all these enterprises are organized well. There are still many problems in production, circulation, distribution and consumption. Yet these enterprises have a very big potential.

To organize socialist enterprises in a rational way and enable them to display their potentials and advantages is an important question that has to be studied seriously. Two years ago, there was a suggestion to set up, from upper to lower levels, national or regional specialized companies and comprehensive companies composed of various enterprises throughout the country. But it seems now that it is impossible to set up such companies at once. Organizational forms of the economy are decided by the level of productivity. The socialization of our production is not high, while the development of various departments and enterprises in various regions is far from being balanced. In such a situation it is impossible to organize all enterprises at once into specialized and comprehensive companies characterized by high concentration of labor force, finance, materials, production and supply and marketing. If we fail to proceed from reality, fail to consider the need of the development of production and fail to consider economic results but instead organize all enterprises into such companies by order from above, such a move will result in nothing but "old wine in new bottles." Such companies are in fact covert administrative organs that will only bring more duplication to administrative work and bureaucracy and will fail to promote economic development. Practice has proven that such a move has many defects. For example, with a degree of concentration, such companies can easily turn into monopoly organizations that will hamper competition. Such organizations can easily concentrate into the hands of higher authority power to deprive enterprises of the limited autonomy they have just won and hamper their initiative. Such companies will also sever the economic relations among the enterprises. Consequently, when the enterprises of a company want to coordinate with those of another company, the company to which these enterprises belonged must first of all contact the other company and the enterprises of these two companies can coordinate only after approval from the companies concerned. Another defect is that with such companies, economic results may be neglected. For example, the Northwest Farm Machinery Company, which was set up in March 1978, is composed of 144 factories that have to organize cooperation within a vast area covering 3.3 million square kilometers. The greatest distance between factories is several thousand kilometers. In addition, 20 percent of the factories are not located along railways. As a result, the cost of a tractor made by this company is as high as 15,000 yuan, compared with 9,000 yuan for a similar tractor made in Tianjin.

Experience has also proven that to organize various integrated economic organizations through various forms and carry out rational coordination between specialized departments on the basis of voluntary and mutual interest is beneficial to taking advantage of superior features, launching competition and speeding up the development of the economy. This year, enterprises in Sichuan Province and other places have taken the road of integration on their own initiative to establish various forms of economic integration. This has a number of advantages, including: They make it possible for various economic units to take advantage of their superior features and improve economic results; they enable enterprises to link up economic relations among themselves so as to break away from regional blockades and division by departments; they are helpful for realizing coordination between specialized departments, avoiding unnecessary repeated construction and avoiding blind production; and they meet the interest of attracting local and enterprise finance into urgent economic construction. All these are possible because such integration has many advantages. It is because of these advantages that when the integration was first advocated by the party Central Committee, many enterprises in various places established such economic integration. In the first half of this year, 140 joint enterprises were established in various forms in Shanghai's light, textile and handicrafts industries and they have gained notable economic achievements. For example, the handicraft enterprises that took part in joint ventures generally began their production 3 months after they signed contracts. In a matter of 6 months they formed productive ability. They can recoup their investments in 1 year. Such joint ventures mainly use existing equipment instead of undertaking new capital construction projects. They have thus gained a new experience.

Economic Integration Must Not Be Restricted by Trades, Regions, Ownership and Subordinate Relations

In the past, inner economic relations of enterprises were often severed when administrative methods that violated objective economic laws were used in economic management. Economic integration will free enterprises from the yoke of departments and regions and enable them to get away from administrative organs. In the past, enterprises were restricted by administrative organs in many ways. For example, industrial enterprises were not allowed to sell their products on their own accord; the enterprises under agricultural departments were not allowed to engage in commerce, while the enterprises of certain industrial departments were not allowed to produce things made by other enterprises. Such administrative restrictions bear the features of social guilds. There were various restrictions in the guilds of feudal society. Only by breaking away from the restriction of trades and departments will the relations of production be able to get away from supply and sales, from "big and complete" and "small and complete" and be changed in the interest of developing coordination between specialized departments. There were also many regional restrictions in the past. They included blockades of markets and materials. Such regional restrictions also bear the features of feudal society. A feudal society inevitably gives rise to feudalistic separatist rules. Socialized mass production demands that regional restrictions must be abolished to enable various regions to display their economic advantages; on the basis of development, the gap between poor and rich will be narrowed.

Economic integration must not be restricted by ownership and subordinate relations. Yet there are still many restrictions in this respect. There is a theory which holds that the "collective" must make the transition to the "whole people" and that when the "collective" is integrated with the "whole people," it is the revisionist theory of "mixing together." Both the "collective" and the "whole people" have their own advantages; therefore the question of the trend of their development can only be solved in practice in the future. There is no doubt that both the "collective" and the "whole people" will exist side by side for quite a long period to come. The integration of the "collective" with the "whole people" will help each other display its advantages and make them complement each other. Such integration is not transition from the "collective" to the "whole people," it is an integration embracing both. Public economy can also be integrated with private economy, such as in the case of joint ventures operated by our country with companies from other countries. The "collective" can also be integrated with individuals. Economic integration must in no way be restricted by subordinate relations. That is to say, enterprises under the party Central Committee may integrate with those of the provincial, regional and county levels. For example, an electronic company in Nanjing is composed of enterprises under the Fourth Machine-Building Ministry and under the Nanjing municipality. Some of these enterprises are of the "collective" and some others are of the "whole people."

In order to enable economic integration to develop smoothly, the ownership, subordinate relations and the relations of finance of the enterprises that are integrated must not be changed at will. The relations of handing over profits, the right of credit with bank as well as the relations of liabilities also must not be changed at will. If changes are to be made, this can only be done with approval from the departments and units taking part in integration and from financial departments and the banks concerned.

Economic Integration Must Be Carried Out in Various Forms According to Reality

Different enterprises need different forms of integration because they have different productivity and different needs in developing production. The forms of integration depend on the actual needs of various economic units. It is advisable to adopt flexible measures and establish various forms of integration. Thus the forms must not be confined to hard and rigid rules, while the thinking blindly of seeking certain advanced forms must be avoided.

Over the past year, many forms have been used by many places in integrating the economy. In general, these forms include: First, integration of production. This form is used in integration by ballbearing enterprises in Sichuan and Henan provinces. Integration of sales. For example, more than 20 measuring and cutting tools factories under the First Ministry of Machine-Building were integrated according to sales and they organized production according to sale contracts. Integration of transportation. Trucks in Shanghai and Tianjin were organized according to trades and different regions and they are used in a planned way. All these integrations are formed from the point of the processes of production. Second, the forms are based on essential factors in production. They include integration of capital such as in joint ventures. For example, a chemical plant in Sichuan invested in individual enterprises. Enterprises in Shanghai invested in enterprises of other places. Integration of technology, such as technical coordination. Integration of labor force. For example, some factories in Shanghai integrated with enterprises under the people's communes and production brigades on the outskirts of the city, with the former providing technology. Integration of workers. For example, enterprises in urban areas assigned enterprises under the people's communes and production brigades the tasks of producing some products or accessories, to rationally make use of surplus labor force in rural areas. Integration of materials such as raw materials and fuel. Integration of various essential factors in production. For example, one side provides capital while the other side provides laborers; one side provides equipment while the other provides land, or one side provides technology while the other provides raw materials. Third, integration from the angle of business. This integration includes integration of exploiting resources; joint sales by agriculture, industry and commerce—comprehensive integration of agriculture, industry and commerce. Fourth, integration from the angle of the forms of business, such as establishing parent companies and their branches; joint ventures by several factories and people's communes and production brigades; or setting up a factory that is composed by several enterprises of the same trade. Some enterprises in different provinces are now planning to set up joint ventures. Fifth, from the angle of ownership, the above-mentioned integrations vary in the composition of ownership. They include integration between the "whole people," between the "collective," and between the "collective" and the "whole people." There are also integrations among various ownership forms in the rural and urban areas.

In short, economic integration is a process of constant development. Therefore various types of integration must be formed according to different situations and different needs. Organizations of economic integration by various economic units have gradually developed from coordination of production, compensation trade, joint ventures to integrated companies. That is to say they have developed from lower to higher level and from smaller size to bigger size.

Implement the Principle of Voluntariness, Equality and Mutual Benefit, Practice Independent Accounting and Responsibility for Losses and Profits

In integrating economy, the principle of voluntariness, equality and mutual benefit must be followed and it must be coupled with independent accounting and sole responsibility for both losses and profits. At the same time, state quotas must be guaranteed.

The principle of voluntariness. In organizing integration we must proceed from the need of the development of production and must persist in the principle of voluntariness. This work must not be carried out forcibly through administrative order. It must be carried out through the initiative of the enterprises themselves with help from higher authority. By so doing it seems that the process is slower, but such a method will attain better results with quicker process. In short, in carrying out integration, the units concerned must fully discuss the method they are to use. Such integration must be developed from simple to complicated and must develop gradually and steadily. We must seek efficient results and not seek opportunities to show off or promote certain forms. It cannot be done in a rush with a mass action, nor can it be done with uniform methods.

To persist in the principle of voluntariness means that both sides must voluntarily take part in integration. Both sides must be "free to choose their spouses." There should be neither "arranged marriage" nor "forced marriage." The departments concerned must do a good job of "introducing spouses" and linking up the relations of various units so as to create necessary conditions for integration.

The principle of equality and mutual interest. Equality and mutual interest are the basis of voluntariness. Therefore in organizing integration we must persist in the principle of equality and mutual interest and take into consideration the economic interest of all sides. Rational pricing, distribution of the results of the operation (profits and products), the ratio of liabilities and the signing of agreements and contracts must all be done according to the conditions provided in various aspects such as funds, resources, raw materials, equipment, facilities, sites, technology and labor force. All sides must observe the agreements and contracts.

The organizations of economic integration and the various sides that join the organizations are all legal entities. Therefore their ownership and rights must be respected and protected by law and the agreements and contracts they sign must be protected by the state and law. No department or person is allowed to seek egalitarianism and indiscriminately transfer goods, equipment and materials that are owned by either side. It is forbidden to infringe upon the autonomy of enterprises by making use of integration. As corporations, economic integration organizations are not restricted by the ownership of trades and regions. The ownership, subordinate relations and finance relations of all sides taking part in such organizations must remain unchanged.

Independent accounting and sole responsibility for profits and losses. Such responsibility for profits and losses means that enterprises are in a position to handle their profits and they must be responsible for losses after the profits are deducted by various expenses and tax and after they have performed their obligation for the state. The enterprises under ownership by the whole people that are solely responsible for their own profits and losses will maintain the nature of their ownership. Their ownership belongs to the people, and it is only the rights of usage and business that belong to the enterprise and can be separated from ownership right.

Various organizations of economic integration must perform their obligation for the state. They must insure that their tax is paid and that the quotas of the profits to the state are met. They can in no way take in state revenue under the pretext of integration.

In general, the wages and welfare of the staff of such organizations remain the same as those they received from their enterprises. This means that wages and welfare must not be changed at will.

It is necessary to stress here that the relations of coordination of various sides taking part in integration cannot be presumptuously discontinued. The existing coordination must be maintained even after the organizations are set up. The existing relations of coordination can only be changed through consultation and when new relations are formed, to insure that each side can carry out its production smoothly.

The organizations of economic integration must carry out democratic management. They may set up committees composed of all the units concerned to guide the implementation of the system of responsibility for economic management. The forms of management must be established according to actual situations and must be constantly improved through practice.

How To Support and Promote Integration

Economic integration is a new thing that needs support from various departments. We must actively support and encourage any form of economic integration that is in the interest of promoting production, linking up supply and sale and promoting economic growth. All departments concerned such as finance, banks, tax, pricing, goods and materials, transportation, commerce, supply and sale and foreign trade must actively support such integration. For example, organizations of economic integration are allowed just to pay only increment value tax so as to avoid duplicate middle-link tax. Banks must select the organizations that are doing good business and support them in ways of credit and interest rate so as to help promote them.

The new problems that arise in carrying out economic integration must be studied and solved by various departments concerned and economic theoretical circles. Planning departments must strengthen their work so that the integration will be in the interest of the readjustment and development of the national economy and in the interest of avoiding blind readjustment. But these departments must in no way irrationally restrict and interfere with the organizations. The policies, systems and working methods of various departments must also be improved to help consolidate and develop the integrations. It is very urgent at present to study the forms of management and the distribution of products and profits, the nature of ownership and the trend of development of the organizations of economic integration.

In addition, laws and regulations to protect and promote economic integration must be formulated so that the organizations of economic integration will have laws and regulations to observe.

NATIONAL POLICY AND ISSUES

PRC JOURNAL ON NATIONAL ECONOMIC MANAGEMENT

Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 10, 15 Oct 80 pp 9-13

[Article by Yu Guangyuan [0060 0342 6678]: "Take the Science of National Economic Management Seriously"]

[Text] In early 1978 when we emphasized that we must take economic management seriously, everybody understood that economic management referred principally to enterprise management. This was because the problem was raised as a result of the "gang of four" running amuck at a time when the normal management of enterprises had been seriously disrupted and even after the crushing of the "gang of four," many problems still remained unsolved and enterprise management had to be strengthened and readjusted. At the same time, in the original set of methods for enterprise management in our country, some of them were relatively backward and were not able to meet the requirements of modernization. For this reason, the general opinion was that if we did not take enterprise management seriously and did not advocate that enterprise management must be scientific and modernized, then our country's economy would not be able to develop smoothly. It was within this framework of understanding that JINGJI GUANLI was conceived.

Over the past 2 years we have done much work in such directions as propagating the necessity to improve enterprise management, popularizing scientific knowledge in enterprise management, conducting experiments on making management scientific and modernized, and training up specialist talents in enterprise management. We not only started the publication of management magazines but also set up a number of public academic organs with a bearing on enterprise management. Some of the universities also established research units concerned with enterprise management. Many educational institutions gave important attention to courses on enterprise management and some institutions of higher learning set up special departments to teach this subject. Many study classes and research units on enterprise management were instituted for the benefit of working cadres. Generally speaking, rapid progress has been made in this field and notable results have been achieved.

It must be remembered that in our country there are over 50,000 rural people's communes, nearly 700,000 production brigades and over 5 million production teams. In addition, we have over 300,000 industrial enterprises (including those owned by the whole people and those collectively owned in cities and towns), and over 1 million commercial network units. All these enterprises are the basic economic organs of our country. Good or bad performance in enterprise management work has a direct bearing on good or bad performance in the basic work of our entire national economy. For this reason, we must further improve our knowledge and understanding of enterprise management. In my opinion, we should pay great attention to how to formulate a set of advanced management systems and methodology which suit our country's needs, based on the socialist nature of our enterprises and on the experience we have gained in enterprise management over a prolonged period while at the same time making use of the scientific and modernized management methods of foreign countries. This is a big and difficult task.

As everybody knows, economic management may be divided into two portions, namely, enterprise management and national economic management. To borrow from terms in physics, it may be divided into microcosmic economic management and macroscopic economic management. Since China is a big socialist country and has a large number of enterprises, the task of improving enterprise management is rather difficult and complicated. The fact that China is a big socialist country also makes the task of national economic management very difficult and complicated. National economic management embraces not only management of the entire country's economy but also management of the economy of each and every province, each and every municipality, and each and every special district or county under a province.

Actually, there is no need to dwell on the important nature of national economic management. If management work on the whole structure has not been done well, then even if work on part of the whole is satisfactory, big losses may still be entailed. And the situation would be even worse if work had not been done well either on the whole or on part of the whole. We have all along reasoned in this manner and modern science has done likewise. Hence, we must emphasize not only that the work of enterprise management be done well but also that the entire national economy be under scientific and modernized management. In particular, this is because our country is a socialist country and socialist production is production built on the basis of ownership of the means of production by society and has as its starting point the interests of the entire society and the interests of the working masses of society. The innate and special nature of socialism is to manage the entire national economy with a definite objective and in a planned manner. Therefore, under the socialist system, it is necessary to pay particular attention to management of the national economy. It is also possible to achieve even more effective national economic management than in capitalist states.

Over the past 2 years, not only have we paid important attention to enterprise management, but also we have kept a close watch over management of the national economy. We recall that within the short space of 2 years we have brought up many important problems with a bearing on management of the national economy. For example, we raised such topics as the economic target of socialism or the objective of socialist production, reform of the socialist economic structure, or composition of the ownership system under socialism in our country, development of the particular advantageous conditions of the localities, banning monopoly and mutual blockade and giving free vent to competition, allowing uneven development in certain localities and giving aid to undeveloped localities, gradually narrowing the price scissors between industrial and agricultural products and rationalizing disparity in price between various products, the type of planning system to be set up for a socialist national economy, the important position of education and science in the national economy, methods and their integration in formulating the national economy, democratization and systematization of management of the national economy, assessment of the economic effects in developing the national economy, and so on. Each of these topics embraces many other important problems. For example, the topic of reforming the economic organization system embraces the problem of expanding the decisionmaking powers of enterprises, the problem of breaking the barriers between the ownership systems of trades and the localities and promoting their unity, the problem of reforming the financial and foreign trade system, and so on. We could quote more topics or problems of this nature but we shall not do so here. They are all big problems relating to management of the entire national economy. In my opinion, just to bring them up is already in itself an important achievement. Correctly raising a problem, engaging in research and discussion thereon, and reaping the fruitful results of scientific research are essential steps in the solution of problems which have a bearing on guidelines or policy in the field of our country's national economic management. Hence we have reason to hope that these problems that we have raised ourselves may be studied in a more penetrating and concrete manner. At the same time we should continue to bring to mind other important problems with a bearing on national economic management and draw them to everybody's attention for discussion.

I feel that in comparing our work on national economic management with that on enterprise management, we can find a special feature, which is: concerning the sector of national economic management, many problems of principle have been brought up but little work has been done in propagating and popularizing scientific knowledge, particularly knowledge of a more concrete type, concerning national economic management. Also, little work has been done in training up cadres with specialized and scientific knowledge of the national economy. I do not know if my observation is correct or not. If my observation is in accordance with the actual situation, then I feel that today I should bring up one problem which is that we should take the science of enterprise management as seriously as we take the science of national economic management and should promote the popularization of research and training or teaching work in this field.

I feel that the phenomenon mentioned above is related to the special feature of national economic management, because national economic management is concerned with a much wider field, is strongly theoretical in character and is not as specific as enterprise management. Macroscopic economic management science and microcosmic economic management science both have their own peculiarities. But I feel we should still emphasize giving further important attention to the research, popularization and propagation of the science of national economic management.

Among the sciences related to national economic management, first of all we should mention political economics, particularly its socialist portion. It plays an important guiding role on national economic management. In recent years, some progress has been made in this field and certain phenomena that have been displayed have been pleasing. Comrades now engaged in research on the socialist portion of political economics are more adept than before at observing actual economic life from which many noteworthy problems have been raised. This is unlike the former situation of being seriously bound by doctrinairism and empty thoughts. Nevertheless, seen solely from the angle of national economic management, there are still many more problems for research and it seems that scholars engaged in the study of political economics should broaden their scope a little.

Problems of political economics are not the only topics with which research on national economic management is concerned. Our research must be extended to many problems concerning the economics of the productive forces, the various aspects of social reproduction, the departmental economics of those departments of the national economy concerned with economic matters, and to management science in general. This is because research on national economic management must embrace research on these economic sciences and on the science of management. Besides, researchers on national economic management must possess many kinds of related specialized knowledge, including knowledge of natural sciences and certain other technical know-how.

I feel that the work we are doing at present is not sufficient unless we mention such factors related to national economic management as the research, popularization and teaching of specialized scientific knowledge. To cite an example, at present we have very few research organs devoted to specialized research on national economic problems. We have as yet no specialist journal in this field. Articles of a specialized academic nature are very scarce. Few educational institutions have set up special departments for the training of national economic management personnel. It is true that some educational institutions have in their curriculum courses on national economic management but because of the little research work done, generally speaking the teaching materials are comparatively out-of-date. Among students sent to study abroad, none seem to have been assigned to this special field of study. I do not mean to say that we have not done any work in this connection at all. What I mean to say is that we never seem to have been very concerned with this matter before and hence in our work we were not so aware and systematic.

Let us take an example concerning urban construction. This is an item in the sphere of national economic management. It is an important problem and also an urgent one in our country. Our defects in urban construction are many. The problems are numerous, such as those concerning housing, supply of vegetables, general consumption and services, telecommunications and transportation, water supply, electricity and heat, underground piping, air and water pollution, garbage, noise, environmental hygiene, and so on. Although conditions vary from city to city, they all have problems such as those mentioned above and city residents have many complaints. All of these problems are urgent ones and must be solved. We have yet to mention other problems such as planting trees in and around the city, or providing facilities to residents for rest or for cultural, recreational and sports activities. Take such large cities as Beijing, Shanghai and Tianjin: our republic has been established for 30 years now, yet during all this time not a single complete urban construction plan has been presented to the residents or brought up for discussion at the municipal people's congresses. This must be admitted as a serious defect in our work. Urban construction requires important know-how. Among personnel in municipal governments or their directly subordinate organs in foreign countries, a large proportion consist of experts who have received higher education on subjects specializing topics in urban construction.

I believe that the poor showing in our work, aside from other reasons, may be ascribed mainly to our lack of scientific know-how in urban construction. I am afraid that at the moment very few cadres working in our cities and towns have had systematic training on the scientific knowledge of urban construction. Even now, we do not seem to have any provision in our institutions of learning for the training of expert personnel in this field. Naturally certain of our technical schools may offer engineering and technological courses related to urban construction. I have not heard of any educational institution preparing teaching materials covering our own experience in urban construction over the past 30 years or conducting systematic research into urban construction experience in foreign countries. Indeed, we do not know how much longer we must wait before a large body of our experts on urban construction can graduate from their schools and be dispatched to responsible posts in the urban areas.

As for the responsible personnel of national economic management departments who must attend to urban construction work and at the same time to work in the rural villages of a county, or district, or even a province or a large tract of farmland, they must have a much wider knowledge and scientific know-how. It seems that we have paid no attention to the training of this type of personnel in national economic management.

Let us turn to another phase of work as an illustration. In order to make a good job of national economic management work, we must do well in such other fields as statistics, land research, and collection of data on market conditions and on economic technology. What we have now in practice is a socialist planned economy. Hence, we must have on hand various kinds of "planned materials" for use in scientically formulating the national economic plan. In another article I have already discussed the types of plan that must be embodied in a socialist national economic plan and have also discussed the concept of "planned materials." They will not be repeated here. What I wish to say now is that the planned materials encompass many aspects and that to obtain these planned materials we must employ specialized scientific and theoretical methodology and know-how, and must have specialized personnel and a specialized organizational structure to handle the work. I would like to cite the following three illustrations:

1. In the formation of a socialist national economic plan, we must possess various kinds of relevant statistics. At present in many countries, such statistics are supplied principally by national statistical organs. It is true that in some countries, certain financial institutions such as banks also supply many kinds of important statistics. Banks are in a position to supply these figures because they have ready access to them. But a national statistical organ can, by means of legislation, require the relevant quarters to submit the statistics needed. This special power of a national statistical organization enables it to acquire in good time the necessary data for compilation of complete statistics. But in order to perform its work well, a statistical organ must have conducted special research into the theory and methodology of national economic statistics, must have a sufficient number of specialized personnel and must have advanced technological equipment. Only in this way can it compile in good time various kinds of statistics and carry out scientific analysis. In addition, this organ must be adept at using current data to make a scientific forecast of future development.

2. In the formulation of a socialist national economic plan, we must have a correct and detailed understanding of our country's natural resources, natural conditions, economic resources, economic conditions, and so on. For example, our country is a big country with a vast territory and rather complicated conditions. It is not a simple job to obtain a clear idea of the conditions of the territory. Because of insufficient work in the past, we are not absolutely clear about certain conditions of the land. Thus, our statistics on the acreage of cultivated land are not entirely correct. This requires additional surveying work on land throughout the country. We also need a scientific description and analysis of the conditions of the natural geography and economic geography of the entire land, and must explore, survey and carry out research on our underground resources. We must study the geographical distribution of the population and of the productive forces. The purpose of such research and survey work is not only to know current conditions but also to prepare the way for forecasts of the future and to find out the various possibilities for the proper utilization of developed land. To find out how a piece of land may be put to the best use or how to achieve useful effects or to find out whether large or small benefits can be derived therefrom, it is necessary to provide the necessary data. To carry out work of this kind requires specialized scientific know-how pertaining to national economic management and also requires a large force of specialized personnel.

3. To compile a socialist national economic plan, it is necessary to make a good job of market investigation work and to have a firm grasp of market trends. Therefore, in order to understand society's needs and the circumstances governing changes in consumption and production in the country, it is necessary to know the conditions prevailing on the international market. It is not easy to perform this task well because it requires an understanding of the conditions and the knowledge must be accurate and timely and must supply the details and the most important points. It is a kind of specialized knowledge, requiring specialized and trained personnel.

To compile a socialist national economic plan also requires a timely understanding of the present conditions and the trends of future development of the economy and of scientific technology both at home and abroad. Information of this kind helps current work and is also a necessity in contemplating problems of economic strategy. People should not only devote attention to studying the development of scientific techniques but also watch and study changes and developments in other sectors of society. The importance of this kind of work is reflected abroad in the great attention paid to "futurology." This concerns specialized scientific knowledge in another field and requires another set of specialized personnel.

Although the actual contents of market surveying and research into economic and scientific technological developments are not the same, yet they both belong to the field of data collection and study of the data collected.

To sum up, all such work requires specialized scientific and technical knowledge. As a matter of fact, a special branch of specialized science and technology has been developed to answer the need and only those who have been trained in such specialized work have the qualifications to fill posts of this kind.

The three lines of work mentioned above are all for the purpose of acquiring the necessary materials for the compilation of a national economic plan and for carrying out scientific management of the national economy. As for enterprise management, this also requires materials from these three aspects. However, since the sphere covered by the enterprises is comparatively narrow, the work in the acquisition of these materials is aimed principally at serving national economic management. All the sciences related to this work also belong to the realm of the science of national economic management.

Recently, I visited the Planning and Budget Ministry of the Mexican Federal Government and was informed that the ministry had under it a department known as the National Services General Coordination Department for Intelligence, Statistics and Geography. Under the department were the National Statistics Bureau, the National Land Research Bureau and an intelligence research structure. The area of work of this General Coordination Department corresponded entirely with the three lines of work we mentioned. I believe that the Mexican Government had good reason to install service organs involving these three categories of work under the Planning and Budget Ministry since the materials from these three sources are all essential data for compiling plans and determining the budget.

I may here add some supplementary information. The responsible person of the National Land Research Bureau of the Mexican Planning and Budget Ministry told us that the bureau had under it a staff of some 2,500 people. Their job was to make various kinds of maps of the entire country on a scale of 1:500,000. They had to make many different kinds of maps. We visited the bureau's workshop which turned out these maps and also their electronic equipment. We found that they principally relied on aerial and satellite photography for the land survey and used a method combining remote sensing with on-the-spot surveying to make an extensive study of the country's land. In Mexico we also visited the office of the population deployment vice minister of the Mexican Ministry for Population Deployment and Public Works. The office had a staff of 1,500 people. They used the maps supplied by the National Land Research Bureau to examine projects for population deployment, urban construction, national communication and transportation and water conservancy. The decisions taken on the basis of the results of the examination and research work were forwarded to the public works portion of the ministry for implementation. From such factual instances as the Mexican Federal Government having two organizational structures of the kind mentioned above and that on our last visit to Hungary, we found that this country with a population of 10.6 million (1979 figure) people had under it a Central Statistical Bureau with a staff of over 1,000 people, I have come to believe that we should have two different kinds of government organs; one of them being an organ of state power and the other a type of organ insuring that national economic management is highly scientific in character. The size of the staff of the first type of organ should be kept to the minimum since too many people may aggravate bureaucratism. As for the second type of organ, either our country does not have any or, if there are any in existence, they are in a very unhealthy state. Therefore, earnest efforts must be made to train up specialized personnel for this type of work.

In my opinion, socialist national economic management work should be organized in three different phases: First, policymaking; second, policy implementation; and third, assessment or inspection. These three phases are interconnected and together form a whole. At the same time, the assessment and inspection phase of the work can revise already existing policies and provide suitable data for future policymaking.

The policymaking phase may again be divided into two sections. One of them attends to preparation work for policymaking. This calls for specialized structures (specialized organs or committees formed by various kinds of experts) to provide a number of projects for selection or adoption. This is to say: it must possess all the data in support of the projects suggested and the projects themselves must have been thoroughly examined before presentation. The person responsible for bringing up the projects should give a briefly summarized but thoroughgoing explanation of the projects. The second portion consists of the policymaker making the final choice from the projects presented by the specialized structures. It is not necessary for the policymaker himself to be an expert on the relevant projects but he must be farsighted, have a knowledge of the situation in his own country and throughout the world, understand wherein lie the interests of the state and of the people and possess the experience and ability to make the best choice. If the preparation work has been done thoroughly and well, and all possible projects have been studied, basically speaking, the policymaker should not have to make expert comments on the projects.

Organizing the implementation work is an extremely complicated and delicate task. It must be accompanied by a full set of working structures, work methodology and steps of procedure. The main point of this work is to earnestly carry out the policy decided upon. A good policy should contain a scientific forecast of possible future developments and provide measures for overcoming such eventualities. However, in the process of policy implementation, unexpected developments are entirely possible. In such a case new or supplementary decisionmaking is necessary.

In national economic management work, it is necessary to examine or inspect the implementation results. This constitutes assessment work. The purpose of this work is to examine whether or not the decisions have been thoroughly carried out and also to determine whether or not the policymaking has been correct.

These three phases of work must be in line with the science related to national economic management. The first phase of this work has already been touched upon above. The second phase involves rather complicated problems, such as what is the best way to organize the implementation. In recent years, this topic has been widely discussed and certain departments of management science have been developed. The third phase likewise requires discussion and specialized research. In this article, I have presented the problems pertaining to the science of national economic management for research in relation to these three phases of work. As for how to proceed further with this research, that will be left to a future date.

NATIONAL POLICY AND ISSUES

PROBLEMS OF MAKING MARKETS MORE ACTIVE DISCUSSED

Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 10, 15 Oct 89 pp 25-27

[Article by Chen Dahu [7115 2192 7711]: "How Can the Commercial Departments Further Enliven the Market?"

[Text] In implementing the policy of combining plan readjustment with market readjustment, the commercial departments' main task is to further improve the socialist market mechanism and correctly bring the regulating effect of price laws into play so as to adapt to the requirements of socialist economic development.

In the past year, the commercial departments have made great efforts to enliven the market. These have included readjusting purchase-sales relationships, developing a wide variety of economic components, opening many channels for circulation, and suitably relaxing planning and price management. Compared with a year ago, the industrial and agricultural departments' production enthusiasm has been increased, and products are more in line with the market; the number of outlets in the commercial network and the number of personnel have increased; under the impetus of competition, types and styles of service have also been improved; and operations are more flexible than previously. However, for all commercial work to adapt to the new situation in which the two "readjustments" are connected, it still must do a great deal to improve the market mechanism. Below I give my own opinions under six points.

1. Adjusting purchase-sale relations. In order to improve the previous situation of excessive rigid, centralized control, in the last year the approach of combining state-monopoly purchase and sale with selective purchase and independent sale has been instituted, using state-monopoly purchase and sale for the first and second categories and selective purchase and sale for the third category. This year's conference of Ministry of Commerce provincial and local office heads proposed elimination of exclusive sales rights and suggested that commodities should be divided into four categories: state purchase and sale, planned purchase and sale, sale on order, and selective purchase (independent sale); in addition it decreased the number of product varieties subject to planned purchase and sale from more than 100 to 42. For these varieties, above-plan output can be disposed of through negotiations between industry and commerce, being either sold by the industry itself or purchased by the commercial departments. For products sold on order the conference issued only reference guidelines; the various local industrial and commercial enterprises must arrive at agreements themselves, sign contracts

and act according to them. The products designated for selective purchase and independent sale can be bought and sold as the situation arises. The clothing industry has already changed over from the previous state processing order system to purchase-sale relations.

The current focal points of disagreement of between industry and commerce are: The commercial departments are requesting state purchase and sale or planned management of some commodities, while the industrial departments are requesting that a certain proportion of the plan for these be left for them to sell themselves; the commercial departments request selective purchase and independent sale of certain commodities, while the industrial departments request that a minimum of 50 percent of output be for independent sale, and the local party organizations sometimes request that they come entirely under exclusive sales rights. Some local industrial departments have already exceeded the specified guidelines and are acting contrary to policy, selling large quantities themselves. On the basis of statistics for the first quarter of this year, purchases by commercial organizations amounted to only 69.2 percent of woolens (compared with 79.2 percent in the first quarter of last year), 74.9 percent of sewing machines (compared with 87.2 percent for the first quarter of last year), and 68.3 percent of polyester blend fabrics (compared with 72.6 percent in the first quarter of last year). In general terms, the proportions of these planned sale commodities sold by the industry itself amount to between 20 and 30 percent, and sales to the commercial departments have not followed the plan.

In accordance with the requirements of the commodity economy, industry and commerce must adhere to the principles of equal value exchange and voluntary accommodation, and must conclude contracts on an equal basis and act in accordance with them. Industrial products can be sold to the commercial sector or sold by industry itself; the commercial sector can select the best products for its stocks, and can also refuse purchase. State monopoly sale is unfavorable to both production and circulation. But under the current situation of insufficient supplies of commodities, such commodities as cotton cloth and embroidered cotton textiles are subject to state-controlled purchase and sale, and supplies are fixed by cloth coupons; products which affect the national economy and the people's livelihood and which are in insufficient supply are subject to planned purchase and sale. These measures are still necessary, and are beneficial to planned disposition of the market. In the future, the scope of plan readjustment and market readjustment can gradually be adjusted on the basis of actual output and needs. In the long run, when production has expanded and output is slightly greater than demand, state purchase and sale and planned purchase and sale can be completely eliminated, and commerce's relationship to industry can be further changed over from purchase-sale relations to distributor relations.

2. Decrease the number of steps in distribution. At the same time as we have improved purchase-sale relationships, we have also changed the circumstances by which commodities are assigned at each level within the commercial departments, allowing the third-level wholesale outlets and the commercial enterprises to sell at will inside or outside their provinces and to sell non-planned commodities, while locally produced and sold commodities may be sold through factory-shop arrangements; in all cases where one locality has two wholesale networks and distribution steps, it must decrease them to a one-stop arrangement. Last year

we eliminated 51 second-level outlets and 132 third-level outlets. In order to foster circulation of small class 3 commodities, and to adapt to the needs of third-level wholesale and of purchase and sale by the industrial departments, many large and medium-size cities have set up small commodity wholesale markets and commission trade companies, while the industrial departments at the various levels also have held various types of commodity supply meetings, experience-exchange meetings, sales exhibitions and the like.

An important precondition for decreasing the number of steps in circulation is the organization of commodity circulation according to economic regions (or economic centers). Currently the greatest question is implementation of separate supply ["eating in separate kitchens"] in the financial system; so-called two-level financial management is actually four-level financial management, and the financial organs at the various levels are competing for profit. In a situation where commodities are insufficient, the localities are also competing for good supplies, so that redundant, irrational second-level and third-level outlets which should be eliminated cannot be eliminated, and circulation links which should be cut back cannot be cut back.

Furthermore, the degree to which the number of circulation links should be decreased differs for different products. Not all commodities need all four links, i.e., first, second and third level wholesale, and also retail, but it is still not possible to arrange a direct production-sale connection. This arrangement is suitable for some products, while others require passage through one link before retail, and still others require passage through two wholesale links. The current problem is that commercial division of labor is too coarse, so that commodity circulation cannot be arranged in the best way for each commodity, and situations of "small commodities, large circulation" even arise.

Accordingly, the main approach to treating the number of links in circulation include the following: First, setting up the structure according to economic regions, eliminating what needs to be eliminated, combining what needs to be combined. Currently, because there are contradictions in four-level financial management, we may consider instituting distribution of a proportion of profit, and instituting center-province, province-city and city-county joint operations as a solution. Second, the individual industries must be broken down further, and some products can be handled at wholesale and retail, simultaneously, so that one physical unit can carry out all the tasks of first, second and third level wholesale and also retail, or a part of these.

3. Clearing out circulation channels. Socialist commerce has three channels: state-run commerce is the principal one, collective commerce is a secondary one, and county-fair trade is a supplementary one. Because of the influences of "leftist" errors, supply and marketing cooperatives were changed over to the system of ownership by all the people, cooperative commerce was limited, and during 10 years of catastrophe, county-fair trade was almost completely eliminated. Since last year, collective commerce has been energetically developed, county-fair trade has recovered, urban farm-products markets have been opened, and the various individual merchants have been allowed to engage in nonexploitative commerce, service and labor, with the result that a situation in which a variety of economic components exist side by side has evolved on the commercial front, so that the socialist market is becoming more lively. In 1978 there were only 54,700

establishments, comprising 1,269,000 persons, in collective commerce. In 1979 the number had increased to 124,600 establishments and 2,058,000 persons, accounting for 15 percent of the society's retail sales; recovering older cooperative commercial establishments has provided a small part of the growth, but the majority of the increase is in new collective commerce, resulting both in an increase in the number of commercial network outlets and in placement for unemployed youth, which has also had an excellent effect in encouraging production and making the markets flourish.

The multiplicity of economic components is expressed in the fact that there are not only collective commercial establishments run by the commercial system but also neighborhood-run collective establishments and establishments run by the people. It is not only the state-run commercial departments that are engaged in sales: industry is selling its own products, and other departments are also engaged in commerce. Reports from Kaifeng indicate that in addition to state-run commercial organizations and old collective commercial organizations, the industrial, materials and foreign trade departments have also entered the market to sell daily-use articles, the supply and marketing cooperatives have come to the cities to sell commercial products, in addition to which there are district and neighborhood collective commercial organizations run in order to provide work for unemployed youth, and permitted individual outlets, so that a situation in which "a hundred parties engage in commerce" has arisen.

The simultaneous existence of a multiplicity of economic components and circulation through a multiplicity of channels has stimulated competition, which has very great advantages for overcoming the officious attitudes of certain state-run shops and improving operations and management. The main current problems are:

a. The policies for developing collective commerce are not being implemented, and funds, housing and facilities are in short supply, sources of goods are not guaranteed, the economic load on retired maintenance personnel is too heavy, and some enterprises are unable to cover their costs, so that they suffer losses. The various relevant policies must be further implemented.

b. Instances of cross-industry operations are very evident, for example, sale of bicycles and sewing machines by household supplies stores, sale of silk cloth by cotton and linen stores, sale of electric fans and firecrackers by grocery stores, sale of firewood by tobacco and liquor stores and the like. Accordingly, where there are many outlets engaged in commerce, there must be a unified commercial law, specifying the conditions and procedures for engaging in commerce, the scope of operations, the policies that must be followed, methods of accounting, tax collecting and payment of profits, forbidden practices and the like.

c. If government-run commerce and supply and marketing cooperatives divide their labor by urban and rural areas, circulation channels become somewhat sluggish, the supply and marketing cooperatives complain that there is a unsufficient quantity of industrial goods in the countryside, and the commercial establishments complain that they cannot get small commodities out to the countryside. An interim solution is to continue relying for the present primarily on a geographical solution, and secondarily on division of labor by commodity, but the supply and marketing cooperatives must be allowed access to the cities to sell agricultural sideline products and local specialties, while the state-run commercial outlets are allowed access to market towns to sell industrial products.

4. Reasonable price adjustments. This is the central question of market readjustment. If we do not have rational prices and we do not allow prices to fluctuate within a certain range, this will affect production and supply, as well as competition and coordination of activity. For third category minor commodities, including most third category manufactured goods, minor food products, and food products of the food and beverage industry which use small quantities of agricultural and sideline products as their raw materials, it was originally planned to use negotiated prices, so that they can be bought high and sold high or bought low and sold low, and can rise and fall; but this year, out of broad considerations of price stability and unity, only a part of agricultural and sideline and local specialty products has actually been subject to negotiated prices.

Because commodity prices are unchanging, many commodity prices are not reasonable, and ones which should be adjusted cannot be adjusted this year, so that some industrial and commercial departments are taking losses on certain products, which is directly harming their production and operations enthusiasm.

On the basis of a document from the Beijing Second Bureau of Light Industry, from 1978 to early 1980 the prices of 28 items needed by the second light industry system increased, including pig iron, coke, coal, steel products, gold, silver, and industrial grains and pigskins, affecting the production costs of 1,200 standard products in 109 varieties, including domestic stoves, domestic scissors, kitchen knives, washtubs, domestic mirrors, chalk, stovepipe, baby carriages and the like, resulting in a total decrease in profits of 16.4 million yuan. Currently Beijing's industrial and commercial enterprises are losing money on 119 daily-use manufactured items. For 31 varieties the problem is being handled through adjustment of profits between industry and commerce, tax decreases, subsidies or increased prices; negotiations are underway regarding six varieties; and there are no profits to distribute and tax decreases cannot solve the problems in the case of 82.

Prices of commodities sold by industry itself are also not in agreement with commercial prices, with the result that industrial-commercial competition is not on an equal basis, and the consumers also have expressed views on the matter. For example, Jiefang brand sewing machines produced in Changshun, Jilin Province, have a producer price of 110 yuan and are sold by the factory itself at 119.10-133 yuan, while the Shuangyanghe supply and marketing collective sells them for 145 yuan, the Yichun Service Company's Zhiqing outlet sells them for 150 yuan, the Yushu County basic-level supply and marketing collective sells them for 155 yuan, and they are on sale in Tonghua District for 170 yuan: many prices are higher than the state list price.

Price adjustment is very important in market adjustment. Certain preparations are being made to start the adjustment with internal price fixing methods so as to adapt to multichannel circulation, decrease the number of steps in circulation, and improve purchase-sale relationships. In this context we must take account of several things. First, we must consider how to take account of needs for storage of products in the area in which they are produced (the "reservoir effect"), and reflect profits to a greater extent in wholesale outlets in the area of production. Second, we must change over from the current method of deductions from the allocated price [diaobo jiage daokou 6148 2328 0305 2706 022 2099] to the markup [shunjia 7311 0502] method, in order to allow for geographical price differences and to preserve the essentially balanced nationwide price levels. Third, after purchase-sale relations are reformed, price fixing between industry and commerce for products for which there are direct factory-store connections or which the factories sell directly to third-level wholesale or retail outlets must provide a reasonable relationship between the procurement and sale prices, so that industry will be able to sell them and commerce to hold them.

5. Protect legal competition. Competition is an objective phenomenon of the commodity economy. But competition between socialist enterprises must be under the unified guidance of the state plan, be on a fair basis, and be run in a law-abiding manner, for only in this way does it help promote coordination. Accordingly, first, it is necessary to solve the problem of unequal positions of different enterprises resulting from unreasonable prices and change the situations in which some enterprises make large amounts of money with little effort while others lose more money the more small commodities they handle. Second, we need a unified commercial law. Third, we must eliminate exclusionary policies so as to bring advantageous situations into play and promote coordination. Currently, local exclusions have already emerged, according to which if a given area has a certain product, sale of that product when produced outside the area is not allowed. When third-level wholesale and retail enterprises buy outside the province, they must observe the limitations of a products list. In reality, the more protection is given to backward enterprises, the less able they are to make progress. In 1979, in order to protect local commodities, the Beijing No 5 Metallurgical Corporation would not allow the shipping in of nonlocal commodity brands and cheap, good-quality products, with the result that its stocks increased 26.5 percent and sales dropped by 16.4 percent.

In order to decrease blind operations and avoid circuitous proceedings, when engaging in competition, market forecasting and situation reporting must be intensified, and plan guidance of the apportionment of production must be strengthened.

6. Grant commercial enterprises relative independence. While under unified planning, commercial enterprises must maintain relative independence. Only in this way can we stimulate enterprises to grasp market supply and demand changes more flexibly, to strive to improve operations and management, and to serve industrial and agricultural production and the people's livelihood better. In reorganizing enterprises, the Ministry of Commerce has laid down some management regulations for retail, third-level wholesale and food service enterprises. Their general spirit of decreasing administrative interference and granting the enterprises a certain autonomy is currently being experimentally adopted. In addition, the provinces all have organizations in which expanded autonomy is being tested. To preserve the enterprises' economic independence, a first important problem is that of changing over from payment of profits to taxation. Currently there is a very pronounced situation in which everyone is fighting for profit in every direction. Implementation of partial retention of profits does not guarantee revenues to the financial organs. In addition, enterprise activity is limited by the division of the financial organs into blocks. It is best to change over

from payment of profits to payment of taxes. After an enterprise has paid its taxes, it keeps all its profits. Naturally, central and local taxes are collected separately. This approach is more beneficial to enterprise economic autonomy than the current system of paying part of profits on the basis of the enterprise subordination system.

Next, the enterprise should have certain funds of its own. This is highly necessary for wholesale enterprises. The system of "separate interest computation on credit" [quan'e xindai, cundai fenkai, fendang jixi] is extremely unfavorable for the wholesale enterprises, which play the role of "reservoirs," and frequently forces them to take account only of fund turnover and not of normal stocks.

Third, enterprise rights, responsibilities and interests must be coordinated. We should also implement the economic accounting system. The profit indicator alone cannot be used to judge enterprise achievement.

ECONOMIC JOURNAL CRITICIZES FEUDALISM IN ECONOMY

HK060512 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 10, 15 Oct 80 pp 14-16

[Article by Qian Jun-rui [6929 0193 3843]: "Vigorously Clear Away the Remnants of Feudalism in the Economic Sphere"]

[Text] The transformation of scientific socialism from theory to practice did not begin in advanced capitalist countries as anticipated by the founders of Marxism. On the contrary, the proletariat first achieved revolution victory and started building socialism in economically relatively backward or even very backward countries like Russia, China, etc. Czarist Russia was a feudal, military, imperialist country. Capitalism developed under the czarist system only for slightly more than half a century, and then the Great October Revolution overthrew the rule of the landlord and bourgeois classes and set up the first socialist country. China had a history of feudal rule for several thousand years. After prolonged revolutionary struggles, it leaped from a semifeudal, semicolonial country to a socialist country. We have leaped over the normal stage of capitalist development. What we had for the past 100 years was simply comprador capitalism heavily tinged with feudalism. This heavy burden of feudalism has made a deep impression on the course of socialism in China and the Soviet Union, both in the economic base and the superstructure, and gives a negative influence. The degeneration of the Soviet Union from the world's first socialist country into a feudal, military, social imperialist country, from a positive teacher wholeheartedly cherished by the world's laboring people into a ferocious and detestable negative teacher, is directly connected with this burden which it had not conscientiously cast off. This is worthy of our serious consideration and vigilance.

New China eradicated feudalism in the economy in a thorough way. The thoroughness in doing away with feudalism in the land revolution during the period of 10-year civil war and in the nationwide land reform after new China was set up far exceeded that of the advanced capitalist countries (for instance, France, England and Germany) and it was even exceptional among socialist countries. However, in the superstructure, especially in the ideological sphere, we are far from having fulfilled the task of thoroughly eliminating feudalism. It should be admitted that our understanding of the danger of the remnants of feudalism in the sphere of superstructure toward the construction of socialism and of their negative influence on the economic base is far from adequate.

Our party has a glorious tradition of serving the people wholeheartedly and of having close links with the masses. However, after our party was in power throughout the country, especially after achieving great victories in the socialist revolution and construction, chiefly because of being proud, bad thinking and bad work styles, such as the patriarchal system, the practice of one person alone having the say, bureaucracy, trying to obtain privileges, promoting on the basis of seniority, rigid stratification, etc., have developed among a portion of comrades, especially among some leading cadres. All these bad things, to a great extent, are manifestations of the influence of the remnants of feudalism.

The essential characteristic of a socialist economy is public ownership of the means of production. In our country state ownership and collective ownership are the two forms of socialist public ownership. They shall exist simultaneously for a long period, each giving full play to its superiority. This kind of public ownership of the means of production is the core of the relations of production of socialism. Only in this way can there be the relation of real equality and brotherhood of the people in the entire economic life of the society; can people be guaranteed to be paid according to their work and not according to their capital or power; can people be motivated to give full play to their initiative and creativity; and can social labor productivity be guaranteed a constant increase and social productive forces rapid development, with the consequent and constant increase in material and cultural needs of the whole society being satisfied to the greatest extent.

Ownership is the most crucial economic relation stipulated by law. Our constitution and law stipulate that all the means of production in state-owned enterprises belong to the people of the whole country and the means of production in collective-owned enterprises (including rural people's communes, production brigades and production teams) belong to all the members of the enterprises concerned. The rights of ownership are chiefly manifested in managerial authority over the enterprise and authority to distribute its products. These two powers converge on whoever is in control. That person is the main indication for measuring whether public ownership is real and whether it is sufficient.

At present, industrial and agricultural enterprises in our country usually practice the system of factory directors (chairmen of the people's communes, heads of the production brigades) assuming the responsibility under the leadership of the party committee. In places and units where democratic style is wanting and the patriarchal system of leadership is practiced, the authority to manage the enterprise and the authority to distribute products are actually in the hands of the secretaries or the factory directors (commune chairmen and heads of production brigades and production teams). There are no staff and workers' conferences or representative conferences or the commune members' conferences. Even if there are any, they are a mere formality, without real power. Socialist public ownership in such circumstances is at least extremely insufficient and quite empty. This is actually ownership by the secretary or the factory director (the commune chairman, the head of the production brigade or production team). It completely destroys the superiority of socialist public ownership and obliterates the initiative and creativity of the masses of workers and peasants for production.

It is correct and entirely necessary to lay stress on centralized unity in the socialist construction. But we must strictly distinguish between socialist centralized unity (whose foundation is democracy with appropriate dispersion as a condition) and feudal monarchy or individual dictatorship. Over-centralization of power, too rigid or too broad a unification, or even everything being decided by the leader himself, none of this has any relation to the socialist economic system. It seriously runs counter to the principle of giving simultaneous consideration to the interests of the state, the collective and the individual. It greatly harms the initiative of different regions and different nationalities in giving play to each individual superiority to develop their economy according to their individual conditions. It deprives different regions and different enterprises of their due right to act on their own, restricts and harms their initiative. Everyone eats from the same pot, holding an iron rice bowl. Each holds himself responsible to his superior but not to the masses. Production is divorced from demand. Production is divorced from marketing. The interests of the state, the collective and the individual are divorced from each other, thus greatly reducing the economic effects of the enterprises, hindering the development of the social productive forces and the improvement of the life of the masses, seriously damaging the superiority of the socialist system.

Socialism is the primary stage of communism. It is also a considerably long historical transition period from capitalism to communism. The economy of this period is a commodity economy under the state's planned guidance, based on the public ownership of the means of production (subsidized by a certain amount of other economic component parts). It is a kind of special highly developed commodity economy. It serves to develop and expand socialism, and thereby creates conditions for negating (destroying) itself.

A feudal economy is basically a natural economy in which a commodity economy has only a subordinate position. A commodity economy once developed somewhat in semifeudal, semicolonial China, but the extent of its development was very limited. The countryside was basically in a state of self-sufficiency. After liberation of the whole country, we built socialism, mechanically applying the pattern of the Soviet Union during the period under the leadership of Stalin. We also had deviations in our understanding. We wrongly thought that a socialist planned economy was incompatible with a market economy, looking upon it as capitalism, at least as a breeding ground for capitalism. Therefore, pure administrative means were employed to run the economy and to eliminate the market economy. The law of value and other laws of economy were treated with indifference. The regulation and rationing of goods and materials according to natural formation were taken as the main channel for circulation and distribution. These formed the foundation of the economic management system in our country. We know that the Soviet Union suffered from this kind of economic management system in its early stage. In China where the commodity economy was less developed, we suffered even more from it. We ran the socialist economy in a dry and rigid way. That had much to do with the influence of the deep-seated tradition of the natural economy in our country. Many of our enterprises often tried to make themselves "big and comprehensive" or "small and comprehensive," which ran counter to the principle of production (including service trades) socialization, production specialization and sharing out the work and cooperating with one another. This was also a manifestation of the influence by the feudal manor system and small production.

Another manifestation of the influence of the remnants of feudalism on the economic work in our country was the rather strongly marked style of official industry, official agriculture, official commerce and official transportation. Quite a few of our organs of economic work, and various enterprises of our industry, agriculture, commerce, communication and transportation were often quite bureaucratic. Bureaucracy in state organs and in enterprises owned by the whole people greatly exceeded that in enterprises owned by the collective, and the bureaucracy in enterprises owned by the collective again greatly exceeded that in the individual economy. The only surviving individual economy today has little or no bureaucracy. It can be said that in our country the more public the ownership is the more bureaucratic it is. This seems to have become a law. Unfortunately it is an abnormal law. It can never be a normal law of the life of socialism. Bureaucratic airs is also called bureaucracy. Its essence being separated from the masses, being indifferent to them, paying no attention to their well-being and even ignoring their life or death and bullying them by relying on the great or small power in hand. These kinds of bureaucratic airs are of long standing and well-established. They can be found in capitalism and more easily found in comprador capitalism, but their real native home is feudalism. Feudalism is their ancestor. We must dig up the tomb of this ancestor and uproot bureaucracy. Otherwise, this stubborn illness of our organs being overstaffed, sluggish in work, not serving the masses but being served by them, never paying attention to economic effects and never paying attention to work efficiency can never be fully cured. It is simply impossible to realize the four modernizations without curing this serious illness.

Because of the heavy burden of feudal traditions, our economic work often puts undue emphasis on following the regional administrative division and jurisdiction. This in fact obstructs and disrupts the natural flow of a modern economy by feudal, local, separatist regimes. The characteristics of a modern economy are socialization of production and various kinds of economic life, formation of a unified and complete national economy, to effect a reasonable international division of work and realization of the internationalization of economic life. In our country, different regions should give play to their own superiority according to their own characteristics, organize and combine in various ways in accordance with the principle of sharing out the work and cooperating with one another, and compete under planned guidance; and on qualified basis, form naturally and establish several economic regions and economic centers throughout the country. At the same time, we must resolutely break with the condition of closing the country to international intercourse and boldly expand international contacts on the basis of equality and mutual benefit.

Finally we should like to point out a problem which must be speedily and thoroughly solved. It is the problem of factionalism among economic workers, which is a pernicious influence sown by Lin Biao and the "gang of four." It is a major obstacle preventing us from uniting as one and from being of one heart and soul in carrying on the four modernizations. It is more precise to say that this kind of factionalism is rather of a feudal character than of a bourgeois character. Lin Biao and the "gang of four" themselves are reactionary feudal factions having combined two into one. In order to usurp the party and seize state power, they promoted a feudal fascist dictatorship, trying to reduce our country once more to a colony or semicolony. They made use of backwardness and superstition of some of the masses, stirred up feudal factionalism, split the broad masses into two main factions, which clashed and fought at close quarters, caused great damage to production, sabotaged education, disrupted work, and pushed the national economy of our country to the brink of collapse, which resulted in an unprecedented tragic 10-year calamity. The factionalism incited by Lin Biao and the "gang of four," disguised under the flowery attire of "revolutionaries" and "rebels," restored and developed the most decadent and abominable dregs of the feudal trade association and gangsters of old China, and endangered the socialist construction of our country. After smashing the "gang of four," although this kind of factionalism has been overcome to a certain extent, its remnants still have much capacity for maneuver. We should never underestimate this. Whenever it has a chance, it will change its appearance, fan the flames of disorder, creating disputes and do harm to our most favorable situation of stability and unity.

The 3d Plenary Session of the 11th Congress of the party and the 2d Session of the Fifth National People's Congress called on the people of all nationalities of the whole country to resolutely bring about the great strategic shift of the focal point of our work to effect socialist modernization and to implement and carry out the policy of readjusting, restructuring, consolidating and improving the national economy under the leadership of the party and the government. The present focal point is readjustment and while making readjustment, restructure, consolidation and improvement are progressively carried out. Since the past year or so, remarkable progress has been made in the work of readjusting our national economy and reliable preliminary reforms of the economic management system have also been made or are being made on the basis of investigation and study. In his opening speech at the Third Session of the Fifth Political Consultative Conference, Comrade Deng Xiaoping pointed out: "In order to build our country into a modernized, highly democratic and highly civilized powerful socialist country, it is necessary to give play to the superiority of our socialist system with utmost efforts. The most important thing is: in economy, to enthusiastically develop socialist production and to improve gradually the people's material and cultural life; in politics, to encourage full display of socialist democracy, to strengthen the socialist legal system, and to develop the united, lively and vigorous political situation; in organization, to discover, train and promote in great quantity persons of ability who meet the needs of modern construction, to provide wide opportunities of airing views and to make full use of each man's ability."

The various kinds of influence mentioned above of the remnants of feudalism in the economic sphere are the archenemies against giving play to the superiority of the socialist system of our country and against successfully realizing the four modernizations. The chief ones are the patriarchal system, bureaucracy and feudal factionalism, the three rogues. With these three, the masses of the people cannot be real masters in their own houses and cannot have high enthusiasm, initiative and creativity, and consequently the productive forces of the society cannot be smoothly developed, the life of the people cannot be gradually improved, the socialist democracy and legal system will be trampled and persons of ability who meet the needs of modernization cannot be discovered and trained. In a word, the superiority of the socialist system in our country cannot be given play; the magnificent target of building a modernized, highly democratic, highly civilized socialist powerful country cannot be realized. Therefore, we must fully realize the extreme importance of clearing away these remnants of feudalism and under the leadership of the party's Central Committee, carry out deep and meticulous education throughout the whole party and the whole country. The main methods used are criticism and self-criticism, supported by the establishment and strengthening of systems and necessary organizational and disciplinary measures. We must exert ourselves to clear away the remnants of feudalism in the economic sphere, give play to the superiority of the socialist system and victoriously realize the four modernizations.

NATIONAL POLICY AND ISSUES

POSTS, TELECOMMUNICATIONS MANAGEMENT REFORMS SUGGESTED

Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 10, 15 Oct 80 pp 23-24

[Article by Deng Junwen [6772 0193 2429]: "Some Suggestions for Reform of the Posts and Telecommunications Management System"]

[Text] In the 30 years since the state was founded, posts and telecommunications in this country have developed considerably, and an extensive urban and rural postal and telecommunications network centered on Beijing and linking together the entire country has been gradually developed, but in overall terms our posts and telecommunications activity is developing rather slowly, there is little advanced equipment, communications capacity is small, service standards are rather low, and there are rather many problems with management work. The reasons are manifold, but shortcomings in the management system are an important cause. Accordingly, studies dealing with improvement of the posts and telecommunications management system have become an urgent need. In the last 30 years, the system has undergone five major reforms; at times management has been primarily linear, while at other times it has been block by block, and instances of combining posts and telecommunications and of their separation have existed side by side. About two-thirds of the time, a linear system has been used, while one-third of the time a block-by-block or two-level management system has been used. Currently the management system still has the following problems:

1. A one-sided stress on administrative measures, while ignoring the regulating effect of economic laws on the management system.

For many years articles have been written on the question of whether linear or block-by-block management is preferable, and the question of enterprise subordination relations has been dealt with over and over, sometimes stressing concentration and sometimes stressing lower-level autonomy. The result has been a wavering between the two poles of overrigid unification and chaotic lower-level autonomy. Because of overreliance on administrative methods and the ignoring of the regulating effect of economic laws on posts and telecommunications activity, there has been no overall comprehensive analysis of overlapping relationships in posts and telecommunications economic activity or of adaptation to local conditions. Administrative measures are admittedly indispensable, and there must be a delimitation of the jurisdictions of the central departments and the localities, but exclusive reliance on administrative methods and administrative measures to solve an economic problem, with no account taken of economic laws so as to strike an overall balance, will make it impossible to achieve the desired effect.

2. Supply system management with rigid centralized control of receipts and disbursements weakens enterprise initiative.

For many years, posts and telecommunications enterprises' supply systems have been managed on the principle of "receipts paid to higher levels, higher level approval required for disbursements, materials arranged for at the higher levels, capital construction taken care of by the state." Under this approach, the enterprise's management activity was directly regulated by state organs, and planning with regard to personnel, finance and materials was concentrated in the hands of the state agencies, while the enterprises lacked the necessary autonomy, which restrained management improvement activity and initiative in replacing facilities and carrying out technological renovation.

3. Combined management which does not separate the areas and "one-big-rice-pot" management weaken management of the specialized areas and economic accounting.

The posts and telecommunications sector consists of two distinct components, namely posts and telecommunications. Each of the two areas has certain subdivisions with different characteristics and uses. But for a long time, combined management and "one-big-pot-of-rice" management which do not distinguish the characteristics of the different functional areas have been practiced. For many years departmental leadership by the cognizant state agencies and enterprise management of posts and of telecommunications have been mixed together, with a one-sided stress on correspondence between higher and lower levels, which has weakened specialized management of posts, telecommunications, and their different functional areas. It also has resulted in major obstacles for enterprise economic accounting and specialized area economic accounting, with the result that any reliable basis for judging economic performance and determining funds expenditures by the specialized areas has been lost.

I believe that in order to carry our reform of the posts and telecommunications system, we should lay stress on the following:

1. Adjustment of enterprise structure on the principle of specialization and cooperation, and separation of the post and telecommunications areas.

A rational economic structure is an important condition for promoting the development of modernized large-scale socialist production. Enterprise structure should foster the development of specialized production and cooperation, the improvement of production efficiency and the implementation of economic accounting. More than 95 percent of our country's existing posts and telecommunications enterprises are mixed post and telecommunications offices, while there are only a few specialized postal or telecommunications enterprises. Although both posts and telecommunications transmit information and link society together, the forms in which they do these things are entirely different, and they are two mutually independent communications systems. Most countries make posts and telecommunications into separate communications systems and set up separate posts and telecommunications enterprises. In our country, with its extensive territory and vast population, the combined post and telecommunications system increases the complexity of management and operations. Accordingly, we should set up separate postal and telecommunications enterprises. Experience shows that the current arrangement of postal communications centered in the capital, the provincial capitals and the county seats is suitable. At present the capital, the provincial capitals and the municipalities have individual post offices, but other cities and county seats have posts and telecommunications offices in which the two areas are combined; in the latter we should set up independent post offices. At the same time, to allow for the postal system's characteristics, namely a coherent communication network, continuous delivery, dispersed structure and integrated operations, we should further organize regional integrated postal enterprises by province, municipality and autonomous region on the basis of county seat post offices. As for telecommunications, we have the Beijing Long-Distance Telecommunications Office in the capital, with the responsibility for linking all the provinces, as well as the Beijing Municipal Telecommunications Office, which is responsible for telephone communications within the capital. The various provincial capitals have city-run telecommunications offices--for long-distance telecommunications and local telephone communications. Other than the provincial capitals, the cities and counties have post and telecommunications offices that combine telecommunications and postal functions. As telecommunications has expanded, it has become necessary to manage telecommunications as two separate areas, long-distance telecommunications and municipal telephone (or county telephone). Telecommunications enterprises of this type can thus be set up as long distance telecommunications offices, municipal telephone offices and county telephone offices.

2. Readjust the enterprise management system and bring central and local activism into play.

In reforming the posts and telecommunications management system, we should suitably delineate the operating and management powers of the central departments and the localities, bringing about division of labor and giving each its strengths so that they are well coordinated with each other. National posts and telecommunications should be the province of enterprises directly subordinate to the central departments, and should be directly managed by the central departments, which helps to guarantee that national communications links will operate effectively and that the national communications network will be planned and constructed in a unified fashion. The municipal telephone exchanges and province telephone exchanges which are responsible for local traffic are part of local public utilities and can be managed by the various provinces, cities and autonomous regions as local enterprises. Each province can institute integrated management or independent management by the provincial or municipal office, depending on conditions. This approach is beneficial for coordinated development of municipal telephone, provincial telephone, local industrial and agricultural production, and municipal government construction.

3. Expanding enterprise autonomy.

For a long time, under the situation of centralized receipts and disbursements, and combined operations, whether in linear or block-by-block management, the enterprises have functioned as appendages of the state agencies, have not had much autonomy as regards personnel, finances, materials, production, supply and sales, and have lacked production and operations initiative. The state should give the powers that are now excessively centralized to the enterprises and expand enterprises operating and management autonomy. The state agencies should change their practice of using administrative measures pure and simple to manage the enterprises, and should use economic levers and administrative measures in combination to manage and direct enterprise activity.

ECONOMIC JOURNAL DISCUSSES JOINT MANAGEMENT

HK050950 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 10, 15 Oct 80 pp 37-39

[Article by Wang Guo Cheng [3769 0948 6134], Liu Gang [0491 0474] and Xing Yi Chu [6717 6654 0443]: "There Is Great Promise in Joint Industrial and Agricultural Management--Investigation on the Shanghai Dazhihe Woolen Mill"]

[Text] The Dazhihe Woolen Mill is a new enterprise operated jointly by workers and peasants in Shanghai Municipality. It is a medium-sized woolen mill under the joint management of the Wool and Jute Fabric Company of the Shanghai Textile Industrial Bureau, the Huanglu Commune and the Sandun Commune of Nanhui County. Practice shows that there is a great future for joint management in the textile industry.

The 3d plenary session of the 11th party Central Committee called for emancipating the thinking in the various trades, for the joint management of agricultural-industrial-trade enterprises and for the rapid development of light industries, textile industries and the handicraft industry. The Textile Industrial Department had allocated a set of Japanese woolen textile equipment consisting of 9,200 spindles to Shanghai. According to regulations, the overseas loans and interest to purchase this equipment are to be repaid by the municipal textile industrial bureau by supplying colored fabric. The department stated that there had not been much increase in output though the old spindles have been replaced with new ones and thus we cannot repay the foreign loans on time. These two facts lead us to the plan of using the old spindles in the outskirts of the county and thereby paving a new way for increasing production.

With the approval of the municipal leadership, leaders of the municipal textile bureau arranged negotiations between the worker-peasant joint enterprise and comrades in charge of industry in the Nanhui County Committee. Since it is beneficial to both the agricultural and industrial sides, an agreement was reached rather quickly. Both the industrial and agricultural sides decided to set up specialized leadership bodies immediately and made preparations for the construction of the Dazhihe Woolen Mill and the Friendly Woolen Mill. On 13 February 1979, they broke ground and on 1 February 1980 they started production; the production is all-encompassing. The total construction area of the plant is 13,500 square meters. It has 5,200 British-style woolen textile spindles and 760 workers and can manufacture 800 to 1,000 tons of cashmere and knitted fabric every year to meet export and domestic demands.

Superiority of Joint Worker-Peasant Plants

Joint operation can create new productive forces. The road of joint management is a new way to accelerate the development of the textile industry. For the past year, the constructing and operating of the Dazhihe Woolen Mill has initially revealed the superiority of joint worker-peasant management.

First, develop the superiority of both the agricultural and industrial sides, develop the strong points and avoid the shortcomings and build the plant rapidly. In a joint agricultural and industrial operation, the industrial side supplies specialized equipment and the technical force and is responsible for managing the enterprise. The agricultural side supplies the land, the labor force for capital construction and the workers. This guarantees a rapid start, rapid production and rapid results. As soon as the industrial and agricultural sides had come to an agreement in December 1978, the municipal Wool and Jute Fabric Company, the Nanhui County Textile Company, the Huanglu Commune and the Sandun Commune sent a group to take overall responsibility for the work of constructing the plant. In less than a month, they had drawn up initial plans by selecting the points, coming up with an engineering design stipulating the scale of operation, and stipulating the products to be produced. In the process of construction, the agricultural side called up more than 2,000 laborers. They overcame various difficulties and in only 85 days, completed the tasks of constructing the main plant covering 5,200 square meters and created favorable conditions for beginning production before the scheduled starting date of the Dazhihe Woolen Mill.

The Municipal Wool and Jute Fabric Company also mobilized workers in all aspects of the textile industry and old skilled craftsmen from six woolen mills used their own tools and accessories to install the plant's main equipment. The worker-craftsmen made every minute and second count, and even when they were tired they continued to fight. Under the vigorous support of these workers, all of the 5,200 spindles were properly installed by the end of October. Since February, it has produced more than 180 tons of wool which basically conform to the quality index, earning an income of more than 600,000 yuan. This plant has been earning revenue since it started production. It is estimated that all investment will be repaid by the production output of approximately 1 year. Less than a year was required between ground-breaking and starting full-scale operation in this medium-sized woolen mill.

Next, it helps renovate equipment, taps reserves and is beneficial to reforms, transformation and acceleration of the development of the textile industry. In order to vigorously develop the textile industry, it is necessary to reform the industry according to the principle of specialized cooperation and implement the upgrading and substitution of products. The old products must be "shelved" and those still usable should be sent to the lower levels. A joint worker-peasant plant can shoulder the tasks of "propagating the species and continuing the line" of textile products.

In the Dazhihe Worker-Peasant Joint Management Plant, 11 backbone workers of the industrial equipment plant and technical management departments participate directly in production management and have led the operation and management of the mill onto the right track. In production technology, the workers selected and transferred more than 10 old skilled technical workers to the joint management plant as technical consultants and selected and transferred more than 100 young workers from the joint management plant as "seeds" to be allocated to No 17 Woolen Mill and other units to undergo technical training. After training, these young workers will return to the plant to teach the advanced technology and mobilize a group of people to master new operation skills. The 11 backbone workers are mainly management personnel sent out by state enterprises and are quality controllers. They see to it that production is carried out in strict accordance with regulations. All the workers--old workers with their experience and young workers with their skills--are constantly raising the technological level of production which guarantees quality products. Since the Dazhihe Joint Management Plant started full-scale production, the quality has very rapidly approached the levels of other plants in the same industry and has remained fairly stable.

Within 1 year, the No 17 Wool Mill of the municipal Wool and Jute Fabric Company has installed the 9,200 new spindles and help build the Dazhihe Woolen Mill with its 5,200 spindles. The Dazhihe Woolen Mill produces approximately 1,000 tons of knitted fabric to satisfy domestic and overseas demands. It is estimated that the mill's annual output will reach 30 million yuan. Thus, the taxes and profits submitted to the state each year could reach more than 7 million yuan.

Next, it helps improve the lives of peasants, promotes economic development of the countryside and gradually wipes out the differences between the town and the countryside. In the suburbs of Shanghai, there are many people but not much land, and water conservancy projects over successive years have reduced the area of arable land. This has made the contradictions between a dense population and a scarcity of land stand out even more. Since completion of the Dazhi River project, each person in Huanglu Commune and Sandun Commune has less than 0.7 mu of land on the average. There are many people and not many farm jobs. The commune members took turns doing the work and the surplus labor force urgently needed an outlet. The joint worker-peasant Dazhihe Plant has precisely solved these contradictions in the countryside. These two communes have allocated 71 mu of land for building factories and made arrangements for the employment of more than 700 young commune members, and this has reduced social pressures. The income of these industrial commune members working at the plant is 100 yuan more than an average commune member and there has been tremendous improvement in their livelihood. In the joint worker-peasant operation of the plant in particular, industry both supports and promotes agriculture and will help to develop a prosperous countryside. It is estimated that the annual output of the Dazhihe Woolen Mill will be more than 30 million yuan and that profits could reach 4 million yuan. After proportional distribution, each of the two agricultural communes could obtain a net profit of 700,000 yuan. This will strengthen the collective economy, develop brigade industry, accelerate agricultural mechanization and help to develop a new socialist industrial and agricultural countryside and wipe out the differences between the town and countryside.

Finally, it helps to decentralize industries in the municipality and improve the industrial layout. Industry in Shanghai Municipality is overcentralized. On the average, there are 30 or 40 plants and more than 40,000 people in every square kilometer. This industrial structure needs to be further adjusted. There is a total of 430,000 workers in the municipal textile industry system. The output value occupies one-fourth of the total industrial output of the whole municipality and the amount for export occupies 40 percent of the total export. If textile industry is to be greatly developed, 300,000 spindles will have to be added by 1985 and there must be innovations in the development of wool spindles which will result in a great increase in output. In order to promote the textile industry, it is necessary to add new productive capabilities while continuing to tap reserves and renovating and transforming the existing enterprises. In order to establish new textile plants in the municipality various restrictions such as land requisition, the intensity of work and the speed of plant construction have to be overcome. Therefore, we should definitely open up a second battlefield of textile industry in the county's suburbs. The establishment of the Dazhihe Woolen Mill has opened up a new path in this direction.

Problems That Require Further Studies

First, the question of the nature of joint worker-peasant management enterprise. The Dazhihe joint worker-peasant management plant is a new form of ownership. Its nature needs to be investigated and studied. Can we say that the nature of joint worker-peasant management enterprise is state collective ownership?

The Dazhihe Plant is the result of coordination between ownership by the whole people and collective ownership and not the amalgamation of the two ownership systems. The ownership of workers and peasants of the original means of production for a fairly long period of time has maintained relative stability and cannot be changed indiscriminately. This means that a joint management enterprise must have unified planning over the utilization and calculation of manpower, and supply of financial and material resources. But, the basic form of the two types of ownership remains unchanged, which means property ownership remains unchanged. The staff relations and policies on wages and welfare remain unchanged. The source of funds and the channeling of profits and taxes submitted remain unchanged. This will bring into play the superiority of workers and peasants respectively. They can bring out their strong points and avoid their shortcomings and overcome their weaknesses by acquiring other people's strong points. They can learn from one another, supervise one another and call up the initiative of peasants and workers so that management of the enterprise continues to steadily improve.

Second, the question of investment and profit allocation for joint worker-peasant management enterprise. The Dazhihe Plant was founded on the basis of voluntary cooperation. Therefore, profit allocation must be fair and rational and attention must be paid to the economic interests of the state and collective. Profit allocation in the Dazhihe Woolen Mill is based on the proportion of investment. After detailed calculation and repeated negotiations, the industrial and agricultural sides have ascertained the proportion of profit allocation according to the principle that each should share in the profits. The total investment of the whole plant is approximately 4.32 million yuan and investment from the industrial side is 2.33 million yuan which is approximately 55 percent. Agricultural investment is 1.9 million yuan which is approximately 45 percent. Thus, it is more rational to allocate profits according to the proportion of actual investment. The workers approve of this and the peasants are satisfied. However, there are disputes regarding whether land should be considered as part of the investment. The method used by the Dazhihe Woolen Mill to solve this problem is to require the enterprise to provide a land compensation fee of 300 yuan per year by calculating the annual output of each mu of land. In order to further develop the production of woolen textile, that plant is prepared to implement profit retention after repaying loans which will be used to increase reproduction and for the collective welfare of staff.

Third, on the question of organized leadership in joint management enterprise. The Dazhihe Woolen Mill has set up a leading body under the party's and government's unifying leadership, command and planning and set up a functional organization to unify management and thus attain unity in the following nine aspects: the party, the government and the masses, manpower, financial and material resources, supply, production and marketing. The staff who do the main tasks in the plant and office are assigned by the industrial side while the staff for subsidiary posts are recommended by the agricultural side upon approval of the municipal party committee of the Wool and Jute Fabric Company. On the whole, the industrial side is responsible for supply, production and marketing and enterprise management. The agricultural side is mainly responsible for local tasks such as patriotic public health campaign, militia work and so on. However, in the course of carrying out this work, approval must be sought from the industrial side and this must not affect the mill's production. The Nanhui County Committee intends to set up an investment share company in the future. The various communes will be able to invest by buying shares and there will be a board of directors. The board will handle major questions on the joint management enterprise and there is to be no direct contact with the communes. This method has various strong points. The first is that the municipal departments concerned will establish links with investment companies for planning, and make full use of the existing plants now operating under capacity within the county. They rationally set policy to avoid "a free-for-all" whereby new plants spring up helter-skelter. This will establish a means for requisitioning land as well as extending the front of basic construction. The second strong point is that staff for the subsidiary posts in the joint management plant are all sent from the county committee and they have no relation with the communes. This will simplify organization and reduce the contradictions between the agricultural and industrial sides in staff deployment. The third point is that the various communes are allocated bonuses according to their number of shares. This can solve the phenomena whereby some communes are rich and those living there are happy and others are poor and their people are sad. The county can help and support relatively poor communes in the border areas.

Fourth, the question of management and operation. The Dazhihe Woolen Mill uses the same operation and management methods as the state enterprises. Thus, it exercises excessive and rigid control in production management. The plant has no autonomy in management. This does not help develop the initiative of either the agricultural side or industrial side. Joint worker-peasant management mill is the corporate body of the state enterprise and the commune collective economy. In management and operation, it is necessary to absorb the strong points of the two types of ownership and adopt the scientific part of management and operation in state enterprise, but it is also necessary to develop the characteristics of independent accounting, shouldering responsibilities for one's own profits and losses, flexible management and strong adaptability of the collective enterprises so that the enterprises have certain autonomy in management and operation. Only this way can the initiative of both the industrial side and agricultural side be released and the superiority of joint management enterprise be brought into play.

PRC JOURNAL ON SOCIALIST ENTERPRISE MANAGEMENT

HK100511 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 11, 15 Nov 80 pp 14-22

[Article by Jiang Yiwei [5592 0001 5517]: "On the Basic Characteristics of Socialist Enterprise Management." Article bears the following footnote: "This article was a learned report given by Comrade Jiang Yiwei at the first annual meeting of the China Enterprise Management Association in February 1980. For this publication, the author has made only a few lexical revisions."]

[Text] It was pointed out at an early date by Marx that enterprise management possesses a dual nature, namely, the natural nature which it possesses in relation to the productive forces and to large-scale socialized production, and the social nature which it possesses in relation to the relations of production and to the social system. This dual nature is fundamentally brought about by the fact that commodities possess a dual nature. If we recognize this dual nature, this will have great significance in guiding our correct treatment of the handling of the problem of the similarities and differences between socialist and capitalist enterprises.

In the past, because the tendency toward extreme leftist thought was allowed to spread unchecked, it was only permitted to talk about the social nature and the class nature of enterprise management, and enterprise management and politics were confused, coming to mean virtually the same thing; the basic principles of enterprise management were summed up as containing only a few political elements, and its scientific content, founded on the basis of the socialization of labor and modern production technology, was eliminated completely. As for the valuable experience accumulated in this field by capitalist enterprises, it was dismissed out of hand, and if it was not, it was labeled as "taking the capitalist road." This extremely biased concept, of taking into account only politics and ignoring science, of only taking into account the differences and ignoring the similarities, caused grave setbacks in the development of the science of management in China.

Today we are bringing order out of the chaos, and are beginning to overcome and eradicate the above-mentioned bias, and to admit that management is a branch of science, with its own objective laws; we are concentrating on the similarities of management and, on the basis of summing up China's own experience which has been effective in practice, we are actively absorbing foreign experience, and have thus opened up wide prospects for the rapid development of China's management science.

However, while taking into account the similarities, we must simultaneously pay attention to the differences, for otherwise, another mistaken bias will come about. In the final analysis, there are basic differences between socialist enterprises and capitalist enterprises. If these are given expression in the management of enterprises, socialist enterprise management will inevitably come to have its own special characteristics. Only by gaining an understanding of these special characteristics and by making correct use of them can the superior nature of socialism be brought fully into play, in order to light the way for the realization of a Chinese modernization of management. This article will discuss some simple points of our understanding in relation to this problem.

(1) The Basic Characteristics of Socialist Enterprise Management

The basic characteristics of socialist enterprise management are determined by the socialist economic system. The fundamental differences between the socialist system and the capitalist system lie in the fact that socialism practices the system of public ownership, has eliminated the phenomenon of man's exploitation of man, and that its whole national economy develops in a planned and proportional way under unified state guidance. These special characteristics of the socio-economic system have not only determined the socialist nature of enterprises, but also inevitably cause fundamental differences to occur in the field of management between socialist enterprises and capitalist enterprises.

Enterprise management possesses a dual nature. In enterprise management, as far as the functions of equitably organizing the productive forces and of organizing large-scale socialized production are concerned, there are similarities between socialist and capitalist enterprises, and no fundamental differences exist. Of course, differences will still exist because the levels and scale of the development of the productive forces and the socialization of labor are not the same, the environmental and historical conditions are dissimilar, and so on. But these differences are not fundamental ones. This is by no means the case, however, in matters relating to the handling of production relations and economic benefits within enterprise management; here fundamental differences do exist between socialist and capitalist enterprise management. Because socialism still needs to carry out commodity production, certain characteristics formed by commodity production will continue to exist, such as, for example, the use of the market economy, the role of price laws, the use of economic means in the management of the economy, and so on. These economic functions are very similar in form to those of capitalist enterprises, and in these areas we can, moreover, absorb useful experience from capitalism. But similarity of form is not the same as being intrinsically identical. Since, ultimately, socialist commodity production is not the same as capitalist commodity production, some forms and methods of management relating to commodity production also possess completely dissimilar natures and significances.

Looking at things from the angle of the relations of production, the management of enterprises covers relations in three fields, namely, the relations between enterprises and the state, the relations between enterprises, and relations within enterprises. Under two dissimilar social systems, irreconcilable differences will come to light in these three fields of relationships.

Let us look first at the relations between enterprises and the state.

The socialist state not only has political functions, but also possesses economic functions. In economics, if the state represents the workers as a whole, then an enterprise will represent part of the workers. The relationship between enterprises and the state is thus essentially the relationship between a part of the workers and the workers as a whole. The real nature of this relationship is the relationship of economic benefits, the relationship between the economic interests of a part and the economic interests of the whole.

The two most important forms of ownership system in China's enterprises at present are the system of ownership by the whole people and the collective ownership system, and both of these belong to the category of public ownership systems. Theoretically speaking, in two dissimilar systems of public ownership, there should be some difference in the level of benefits accruing to the section of the workers represented by enterprises. However this distinction has encountered some difficulties in practice; exactly how important this distinction is in theory is a question which is open to discussion. Nevertheless, there is one point which can be affirmed: in the socialist stage of history, commodity production must still be carried out, and enterprises must exist as the basic units of the national economy; whether these enterprises are owned collectively or by the people as a whole, they still represent a producer of commodities, and they necessarily possess the independent nature and independent economic interests of producers of commodities. But they are not the same as privately owned enterprises, in that their independence cannot be absolute independence, and can only be a relative independence, under the unified guidance of the state; as for economic interests, here again enterprises can only strive to increase and develop their economic interests according to the principle of the subordination of the interests of the part to those of the whole. This is a point on which socialist and capitalist enterprises are fundamentally at variance.

Next, we will consider the relations between enterprises.

The relationship between socialist enterprises is also entirely dissimilar from that in capitalist societies. This is because, even if each enterprise is a relatively independent economic entity, all enterprises are still primarily equal members of the socialist economy as a whole, and have common interests. This unanimity of interests determines the relationships between them, which are primarily relationships of mutual cooperation, mutual support and, when necessary, of working together as a single integrated entity. The development of this kind of cooperative relationship can assist in raising the level of socialization of production, thus speeding up the development of the productive forces, which in turn will benefit the growth of the enterprises themselves, and of the national economy. However, a certain conflict of interests must necessarily exist between socialist enterprises, and there must be a suitable amount of competition between enterprises, so as to permit the occurrence of profit differentials according to whether the results of production operations are good or bad. These differences constitute only a contradiction among the people, based on the common interest; under the unified guidance and coordination of the state, not only does the sort of mortal conflict that exists between capitalist enterprises not arise, appropriate differences will, on the contrary, give a significant impetus to the promotion of the development of the productive forces.

Finally, we will consider relations within enterprises.

Within enterprises, as a result of the elimination of exploitation under the socialist public ownership system, the class conflict within enterprises has also been done away with. The staff and workers of enterprises are no longer those who offer their labor for sale, but the owners of the enterprises. The workers are directly linked with the means of production. Whether the state, the enterprises or individuals gain a profit as a result of their labor, the workers are, in the final analysis, working for their own benefit. The individual benefits accruing to workers and staff are in relation to the size of the contributions made by individuals, to the quality of enterprise operations, and to the speed of national economic development. We only need to let the broad masses of workers see this connection, and gain real benefit therefrom, in order to arouse the great enthusiasm and creativity which are the source of the superiority of socialism over the forces of capitalism.

The distinguishing features of the above production relations have determined the basic characteristics in respect of the management of socialist enterprises. What exactly are these characteristics? I believe that the above-mentioned distinguishing features of the production relations can be compressed into three basic characteristics, that is: the state nature of management; the democratic nature of management, and the mass nature of management. None of these three qualities are capable of being fully possessed by capitalist enterprises. They are the embodiment of the superiority of the socialist system. Nevertheless, this superiority is still only an objectively existing possibility; if we wish to transform this possibility into reality, this will still depend on whether or not we are able to adopt the correct forms and methods, in order to give genuine fulfillment to the positive role of these three qualities in the field of management.

(2) The State Nature of Socialist Enterprise Management

The socialist enterprise is an economic unit under the unified guidance of the state which carries out independent operations and practices independent accounting. It should possess considerable autonomy, and also be responsible for its own profits and losses after it has fulfilled its obligations to the state. But it is not the same as a privately run enterprise; each unit is not isolated and cut off from help, and does not stand or fall on its own merits. Under unified state guidance, although an enterprise has autonomous rights and powers, it nevertheless also has clearly defined obligations. The state not only safeguards the legitimate rights and interests of enterprises, but also provides them with guidance and necessary support. Although the state management and administration of enterprises does not constitute direct control, it should still stipulate their direction of growth, so that it is in harmony with requirements for the planned and proportional development of the national economy; the state should formulate all kinds of economic policies and legislation, and should unify and coordinate the operational activities of enterprises. Consequently, in management, socialist enterprises do not have complete freedom to go their own way or for each to do what it thinks right; they have, to a very large extent, a state nature. Only within a scope stipulated by state policies and decrees are the enterprises able to give full expression to their subjective dynamic roles, and to continually improve their operational management, so as to achieve a greater development of the enterprise economy.

Socialist enterprise management has a state nature, and this is not the same as the intervention of capitalist states in capitalist enterprises. In order to coordinate the interests of the capitalists, and to further certain public interests, capitalist states have also increased their intervention in enterprises. In the management of their operations, enterprises must also respect their governments' policies and legislation. But these enterprises are privately owned, and they view state intervention as an additional burden imposed from outside, and they use a great deal of energy in evading state intervention or treating it in a perfunctory manner. The socialist public ownership system determines the relationship between the state and enterprises as the relationship between the parts and the whole of the economic system. This economic wholeness determines the unanimity of interests, and the state's unified guiding role promotes the development of enterprises rather than stifling it. This unity allows socialism to overcome the ungoverned state of capitalist production, and is a powerful manifestation of the superiority of socialism over capitalism. In the past, however, we caused this unity to become absolute, thus completely doing away with the comparative independence of enterprises. In its approach to enterprises, and especially to the production operations of enterprises under the system of ownership by the whole people, the state imposed on them centralized management and direct control by the central organs of state or by the local organizations: their duties were handed down by the state, their funds were allocated by the state, each individual management method was exactly specified by the state, in the economic field, the system of unified income and expenditure was put into practice, and so on. This type of economic setup really meant that the state was transformed into an enterprise of unparalleled size, and thus that every enterprise became a branch organization belonging directly to the state administrative setup. Practice has made it clear that this form of centralized management constitutes a misunderstanding of socialist economic unity, and that it has resulted in the fettering of the self-determining function of enterprises, and seriously obstructed the development of the productive forces.

Unified guidance and centralized management are not one and the same concept. Unified guidance does not necessarily have to make use of the methods of centralized management. To integrate unity with independence, to establish enterprise autonomy, and to allow enterprises to give complete expression to their initiative and enthusiasm, is a central problem in the prosecution of China's present reform of the economic system. But in bringing into play the independent and self-determining roles of enterprises, we must definitely not relinquish the unified guidance of the state; to relinquish this would be tantamount to relinquishing socialism.

In the field of management, socialist enterprises possess a state nature; this means that they should, and must, embody the state's function of unified guidance. This state nature should generally include the following aspects:

1. The establishment and development of enterprises must conform with the requirements for the planned and proportional development of the national economy.

The planned and proportional development of the national economy is a basic principle of socialist economics. Adherence to this principle is an important precondition for overcoming the ungoverned state of social production. The chief measure for the implementation of this principle should be the control of the establishment and of the direction of development of enterprises. The starting up of an enterprise, whether it be owned collectively or by the people as a whole, whether it be central or local, must undergo scrutiny by the appropriate planning departments or industrial and commercial administration and management departments, according to the requirements of state economic policies and of the national economic development plans. The state should draw up an "enterprise law," clearly laying down the procedure for the approval and registration of newly formed enterprises. Thus it will be impossible to gain approval for the establishment of proposed enterprises which do not conform with the requirements of economic development, which do not possess the necessary conditions, or which are not economically feasible in terms of scope or technology. As soon as they have been approved and registered, however, enterprises achieve a relatively independent status in economics and the status of a legal person in relation to the law; in addition they possess all the rights and obligations stipulated in the terms of the "enterprise law." Provisions concerning the direction of product specialization or the modification of established enterprises must also be scrutinized and approved by the state. There should be a precise differentiation of the powers and scope of approval pertaining to central and local bodies.

State control of the establishment and the direction of development of enterprises is the chief function of the state's unified guidance of the national economy, but the setup currently in force is in direct opposition to this; on the one hand, its direct intervention in the operational management of existing enterprises is excessive, and on the other hand it lacks serious scrutiny and control of the setting up of enterprises. We are implementing family planning to control the population, but in respect of the emergence of new enterprises, we are content to let things drift, and this is entirely incompatible with the principle of the socialist planned economy.

2. Enterprises must receive the guidance of state economic planning, and priority must be given to fulfilling orders for goods placed by the state.

Through the reform of the economic system, China will bring into being a planned management system involving the integration of regulation by planning mechanism and regulation by market mechanism. According to the needs and possibilities of national economic development, the state will lay emphasis on the formulation of long-term plans and regional economic programs, pointing the way for enterprise development. As far as annual and day-to-day production plans are concerned, we should give enterprises a relatively high level of production autonomy by adopting the methods of allowing higher levels to be influenced by lower levels, and of integrating higher and lower levels. At the same time, the state will be able to supply enterprises with information and forecasts concerning the requirements of domestic and foreign markets; with reference to cooperation in the distribution of labor among enterprises, the state will, by means of certain mechanisms, be able to effect linkages and coordination, which will help enterprises to develop production in a better way, and to satisfy the needs of society. Certain important or scarce goods and materials should remain under direct state control, and be subject to centralized purchase and marketing, and enterprises may be ordered by the state to produce these goods and materials.

When the above economic setup is in force, enterprises will, subject to the planned guidance of the state, determine their own operational policies and development programs; enterprises should arrange their own production obligations according to state and market requirements, and are also responsible for giving priority to the fulfillment of orders for goods placed by the state.

3. Enterprises should strictly carry out the state's economic policies and respect the state's economic legislation.

The formulation of all economic policies and every piece of economic legislation is an important means for the centralized management of the national economy by the state. Policies and legislation determine the standards which enterprises must abide by in their production operations, and are an important foundation for all aspects of management work in socialist enterprises.

The exercise of a restrictive function in the operational management of enterprises by the state through all kinds of economic policies and legislation is entirely different from the use of administrative means by the state to directly control the activities of enterprises in production operations. Within the scope of policy limitations and what is permitted by law, enterprises may exercise a great deal of autonomy, and realize the full potential of their subjective dynamic roles, just so long as they do not disrupt the unity of the socialist economy. The state can thus greatly reduce its administrative efforts, simplify its mechanisms, and redeploy significant forces to the development of strategic policymaking for the national economy.

4. In accordance with centralized state provisions, enterprises must make rational arrangements for the distribution of economic gains.

Distribution according to work is a fundamental principle of socialism. The proper implementation of this principle should primarily be expressed as the earning of differing incomes by enterprises according to whether the results of their production operations are good or bad and whether their contributions to society are great or small. Then, the equitable distribution of the earnings among workers and staff is carried out within the enterprises, according to whether individual workers' contributions have been great or small, thus relating the earnings of workers and staff directly to the operational results of the enterprises. That there should be a disparity of earnings between enterprises, between one group of workers and another, is in accordance with socialist principles. However, these disparities cannot be unlimited; the gaps must not be too wide.

For the benefit of the rapid development of the national economy, the state should take the correct steps to arrange rational proportions of accumulation and consumption. Aside from the handing over of various sums to the state in the form of taxes, and giving administrative expenses and accumulated funds to the state, within the enterprises themselves, socialist enterprises cannot have complete independence in the distribution of their own earnings; they must carry out distribution in accordance with the centralized provisions of the state, with one part being used as a production development fund for the enterprise and another part going toward wages and bonuses for workers and staff and the development of collective welfare projects.

It is clear from the above aspects that the independence of socialist enterprises is by no means the same thing as the independence of capitalist enterprises. Through the formulation of economic policies, legislation, and centralized economic plans, the state exercises the function of unified guidance in respect of the operational management of enterprises, thus causing socialist enterprise management to possess a state nature. The internal management of enterprises and the state's centralized management are closely connected, and complement each other.

(3) The Democratic Nature of Socialist Enterprise Management

The second characteristic of socialist enterprise management is its democratic nature.

Marx said, "Insofar as its form is concerned, capitalist management is autocratic." ("The Complete Works of Marx and Engels," Vol 23, p 369) This is an unavoidable manifestation of the capitalist system of private ownership. Because of the development of modern production technology, the proportion of mental labor in the composition of labor is steadily growing larger, and modernized production increasingly requires initiative in its production workers. Also, at the same time, because of the increasing acuteness of class contradictions, capitalist enterprises have had no choice but to adopt some democratic management forms, such as the implementation of "worker participation in management," recruiting small numbers of staff and workers to take part in board meetings, promoting workers' "democratic management," and so on, in order to alleviate class contradictions. It should be admitted that capitalist enterprises have achieved a certain measure of success by adopting this kind of method. Under the private ownership system, however, there can never exist any true democracy between the owners of capital and hired laborers, and the authority to manage enterprises can only be concentrated in the hands of the bourgeoisie and their agents. Under certain circumstances, the adoption of these forms of democratic management can play a role in alleviating class contradictions, but can never eliminate the contradictions. Only under the socialist system, with the public ownership of the means of production, and when the workers have become the owners of enterprises, is it possible to implement genuine democratic management.

The socialist public ownership system has made it possible for enterprises to put into effect genuine democratic management. But if we wish to turn this possibility into reality, and bring enterprises under the unified guidance of the state, this will really depend on the masses of workers and staff being the masters of their own destiny, so that their socialist enthusiasm can be brought into play to the greatest possible extent, and we will still need to have a concrete organizational form which is suited to, and beneficial for, the socialist system of public ownership.

The system of democratic centralism is the organizational principle by means of which the proletariat carry out the revolutionary struggle. It represents an important summary of the experience gained by the proletariat over a long period of political struggle. But it can also be appropriately applied to the prosecution by the proletariat of the production struggle. After the victorious conclusion of the October Revolution, Lenin pointed out that, "Our present task in the economic field is to implement the system of democratic centralism...." ("Complete Works of Lenin," Vol 27, p 181) What specific uses may be made of the system of democratic centralism in the management of socialist enterprises, is a matter which is worthy of investigation.

To examine this problem, we need first of all to make a simple analysis of the organized leadership required in the operational management of enterprises. It is clear from past experience that, in carrying out the effective management of modernized enterprises, the power of leadership within enterprises can be divided into three main functions, namely, the power to make policy decisions, the power to direct, and the power to supervise. The power of making policy decisions consists of the power to make decisions on the overall policy for, and the direction of, the production operations of enterprises, and on certain important measures in this field; the power to direct consists of the administrative leadership of the day-to-day activities of enterprises' production operations, and the power to supervise consists of the overall supervision of those who make policy decisions for and direct the enterprises, on the basis of the rights and interests of the owners of enterprises. Only when each of these powers has its own separate existence, and when they interact with each other, can the rights and interests of the owners of the enterprises be safeguarded; only then can the level of management efficiency required by modernized enterprises be guaranteed.

In capitalist enterprises, these three powers are concentrated in the hands of the capitalists and their agents. Generally speaking, the power to make policy decisions and the power to supervise are exercised by a board of directors composed of the representatives of the capitalists, or the power to make policy decisions is exercised by the board of directors, while another supervisory body is formed to exercise the power of supervision, and a managing director is appointed by the board of directors or by the supervisory body to exercise the power of direction. Some capitalist enterprises, as part of their much-vaunted "democracy," have recruited members of their work force to sit on the board of directors, but they are only allowed to occupy a small number of seats on the board, with the result that decisions on matters of importance, and especially on matters relating to the wide-ranging rights and interests of the capitalists, are still made by the directors and the chairman of the board.

The powers of leadership of socialist enterprises reside with the proletariat. Enterprises should carry out genuine democratic management under the leadership of the proletariat's own vanguard force--the Chinese Communist Party--in accordance with the organizational principle of proletarian democratic centralism. With respect to the distribution of labor, however, the powers of leadership may still be divided into the three aspects of the power to make policy decisions, the power to direct and the power to supervise.

Since the founding of the PRC, under the party's guidance, and relying on the feeling of responsibility of the broad masses of workers for their own affairs, much valuable experience has been gained in the democratic management of enterprises. This experience will provide a basis for our further investigation of this question.

In the overall view, the system of representative assemblies of workers and staff and the system of responsibility being taken by factory directors, under the guidance of party committees, in fact retains the concrete division of the powers of leadership into the three aspects of the power to make policy decisions, the power to direct and the power to supervise. At present, the general practice among enterprises is that the enterprise party committee exercises the power to make policy decisions, the head of a factory (or its manager) exercises the power of direction, and the representative assembly of workers and staff exercises the power of supervision. In usual practice, moreover, it is held that the guidance given to enterprises by the party can only be manifested in the party committees' exercise of the power to make policy decisions. However, a considerable number of problems are encountered in practice when things are looked at, and carried out in this way; it is theoretically unreasonable, and also merits consideration.

Comrade Deng Xiaoping has pointed out that, in order to uphold the leadership of the party, we must strive to improve that leadership. He has also raised the question of the reform of enterprises' internal leadership systems.

As far as socialist enterprises are concerned, it is absolutely necessary that the party's guidance of enterprises be strengthened. The party's guidance is mainly embodied in the line, and in the general and specific policies, which are formulated by the party, and only if enterprises persist in carrying these out to the letter can the socialist nature of the enterprises be insured; only then can they adhere to socialist principles in the management of their operations. However, in strengthening the guidance given to enterprises by the party, we do not necessarily have to organize the direct management of enterprises by the basic levels of the party. Enterprises are economic organizations under the centralized guidance of the state which possesses a relatively high degree of independence, and should be directly managed by the workers in the enterprises, for only when this is the case can the enthusiasm of the broad masses of the workers for being the masters of their own affairs be fully activated. As for the three powers of leadership of enterprises, the power to make policy decisions should be exercised by the representative assemblies of workers and staff, and the power of direction should be exercised by heads of factories (or directors); enterprise party committees should then have the power of overall supervision, so as to insure the thorough implementation of the party and state lines and general and specific policies within enterprises.

It is generally held that the power to make policy decisions is the most important among the powers of leadership, and that supervisory power seems to be of only secondary importance. There is a lack of scientific analysis in this traditional view. With respect to capitalist enterprises possessing absolute independence, the power to make policy decisions is the most important among the three powers of enterprise management; as far as socialist enterprises, which have only relative independence, are concerned, the supervisory power is of greater importance. This is because socialist enterprises are only able to make limited policy decisions within the scope of the line, policies and legislation drawn up by the state, and on receiving guidance from national economic plans. The important problem in insuring the state's centralized guidance of enterprises lies in the implementation of effective overall supervision of enterprises' policy decisions. In particular, this kind of supervision will be even more necessary after the reform of the economic system and the expansion of enterprise autonomy have been carried out. Only when party committees exercise the power of supervision, the workers' representative assemblies exercise the power to make policy decisions, and heads of factories exercise the power of direction, when the party committees supervise both the factory heads and the workers' representative assemblies, can real benefit accrue to the party's guidance of enterprises, to the thorough implementation of the system of democratic centralism by enterprises, and to the reform of the economic management system. This sort of guidance setup may be said to be the system of responsibility by heads of factories under the leadership of the workers' representative assemblies. If things are done in this way, many current problems can be resolved, and our theories can be rendered more logical.

First, enterprises are economic organizations, and party committees are political organizations. These two qualitatively different kinds of organization should not be confused. It was pointed out at the 3d plenary session of the 11th party Central Committee that, "We should conscientiously resolve the phenomenon of failing to make a distinction between politics and enterprises within the party, of taking the party to represent politics, and taking politics as representing enterprises...." ("Report of the 3d Plenary Session of the 11th Central Committee of the CCP") The phenomenon indicated here of not making a distinction between politics and enterprises within the party really indicates a confusion in the organizational system. If the party committee continues to exercise the power of making policy decisions within an enterprise, if the enterprise's problems in the field of production operations are directly decided by the party committee, and these decisions are implemented through the distribution of labor by the factory head, so that the party committee forms a component part of the enterprise's economic structure, then it is impossible to prevail over the phenomenon of not making a distinction between politics and enterprises within the party.

Second, the enterprise must of necessity be taken as the standard in China's reform of its economic system, and the autonomy of enterprises must be established. Enterprises should not, as they do under the system currently in force, play the part of branches of the state administrative system, with all their affairs, of whatever degree of importance, being under the direct control of the state organization. The centralized guidance of enterprises by the state will reduce administrative measures by means of the formulation of economic policies, economic legislation, and economic planning, as well as by the use of other economic measures. As the socialist producers of commodities, enterprises will possess a relatively high degree of independence from the state. This is the expression of the characteristic of an enterprise of being an economic organization. Since enterprises have this characteristic, the party committees cannot similarly possess it; they are component parts of the party organization as a whole, subsidiary organizations of the higher level party organizations, which must also be under the direct control of those higher level party organizations. Since enterprises may possess a relatively high degree of independence from the state, enterprises' party committees cannot possess a relatively high degree of independence from the higher level party organizations. Thus, as a result of the exercise of the power to make policy decisions by enterprises' party committees, the overlapping of two qualitatively different organizational systems is brought about, and under these circumstances some contradictory phenomena are bound to arise.

Third, since the reform of the economic system has expanded the autonomy of enterprises, it is necessary to implement the overall effective supervision of enterprises. According to the present way of doing things, the power of supervision is exercised by the workers' representative assemblies. The workers' representative assemblies are mass organizations under the leadership of the party committees, and the supervisory powers which they wield usually only relate to the supervision of heads of factories or directors. If there is any bias or shortcoming in the exercise of the power to make policy decisions by the party committees, this cannot be rectified by mass organizations under the leadership of the same party committees. As a result of this, there is in fact a lack of effective overall supervision of enterprises.

Fourth, rights and obligations should be unified. Under centralized guidance of the state, enterprises possess a relatively high degree of independence, as well as fairly wide economic rights and interests, but at the same time they also have economic obligations and responsibilities. In law, an enterprise should accept these rights and obligations in the guise of a "legal person." Can a party committee exercising the power to make policy decisions within an enterprise assume economic and legal responsibilities as a legal person? This is clearly not fitting. If the party committee does not assume responsibility as a legal person, then the enterprise will lack a centralized authority over rights and obligations, and there will be a contradiction in the field of economic legislation and company law.

Fifth, when the system of democratic centralism is implemented in enterprises, as far as organizational structure is concerned, democracy and centralism should form a directly related organizational system. The party organization itself is an organizational system of democratic centralism which takes the party members as its foundation; it sets up party representative assemblies through election by party members, then establishes party committees, forming the centralized leadership of the party. The enterprise should also have as its foundation the masses of workers and staff; its workers' representative assembly should also be set up through election by the workers, and should elect or appoint the factory head. The power to make policy decisions concerning an enterprise's activities in production operations should be exercised by the workers' representative assembly. In exercising the power of direction, moreover, the factory head should be responsible to the workers' representative assembly. Thus, in the operational management of the enterprise, democracy and centralism form a closely related organizational system. Although the party organization does not have a place within this organizational system, it can nevertheless exercise the party's function of guiding enterprises by means of the overall supervision of this system.

Sixth, since the workers' representative assembly and its standing bodies exercise the power to make policy decisions, they constitute the legal person of an enterprise, and assume the economic and legal rights and obligations of the enterprise, and, when rights and obligations are in conformity, there will necessarily be a further increase in the feeling of the broad mass of workers that they are responsible for their own affairs, and this will bring into play an even greater socialist enthusiasm. With respect to the workers' representative assembly, an enterprise's party committee exercises a primarily supervisory function. The party committee may criticize the workers' representative assembly, make recommendations to it, and may play an active role in it through party member representatives. By relying on the high prestige of the party among the masses, and on the role of party members as models and guarantors, the full implementation in enterprises of party and state lines and policies can be insured. In specific cases, for example in circumstances where the workers' representative assembly will not submit to the enterprise party committee, things can be put right by recourse to the party committee at the next higher level. Workers' representatives who are party members must therefore implement the party's decisions, and keep themselves within the bounds of party discipline.

Finally, the power of supervision exercised by the party committee within an enterprise covers all aspects: it supervises not only the workers' representative assembly and its standing bodies, but also the factory director and cadres at all levels; it not only supervises the enterprise's major policy decisions in operational management, but also keeps a check on unhealthy tendencies in day-to-day work and life. The assumption of indirect responsibility by the party committee for making decisions on, and directing, the enterprise's operational management on the one hand helps to increase the workers' feeling of responsibility for the results of the enterprise's operations, and on the other hand helps the party committee to lighten its load of administrative tasks, to make thorough investigations and research, to analyze problems existing in the enterprise, to determine the direction of the enterprise's development, and to make timely criticisms and suggestions in relevant areas. At the same time, the party committee can bring important forces to bear in carrying out the work of political and ideological education of the party members and the masses, and in bringing into play the pioneering, model role of party members, in order to insure that the enterprise advances along the socialist road. Thus the enterprise's party organization will become more autonomous, possess a greater fighting spirit, and will become the central force of the enterprise.

Under the overall supervision of the party committee, the enterprise gives expression to the role of democratic management, in the form of the workers' representative assembly, and at the same time establishes a system of direction with the factory director at its head, forming a democratic centralist management organization within the enterprise. This is an important embodiment of the democratic nature of socialist enterprise management. The implementation of this kind of democratic centralist management organization will necessarily bring about the further realization of the socialist enthusiasm of the broad masses of workers; while they possess the overall supervision of the party, enterprises will at the same time be safeguarded against any departure from socialist unity, thus permitting the better integration of the unity of the state and the independence of the enterprise.

(4) The Mass Nature of Socialist Enterprise Management

The third characteristic of socialist enterprise management is its mass nature.

As a result of the implementation of a democratic centralist management organization in socialist enterprises, under the guidance and supervision of the party, the broad masses of the workers have really become the owners of enterprises. The individual interests of the workers and staff are related not only to the size of their individual contributions to the work, but also to the results of their enterprise's collective production operations; the inevitable consequence of this is to cause the masses of workers to show an interest in the operational management of the enterprise, to wish to participate in management, and to strive together to improve the results of the enterprise's production operations.

The direct participation by workers and staff in enterprise management is an objective requirement for, and an inevitable tendency in, the modernization of management. Many enterprises in capitalist countries have already recognized this point, and have even adopted measures to draw the masses of workers into participation in management. However, only under the socialist system is it possible to bring about the full realization of the state of affairs in which the masses of workers can truly be relied upon to participate in management of their own volition.

Why is it necessary to rely on the participation of the broad masses of workers in the management of modernized industrial enterprises? This historical trend is caused by the rapid development of modern production technology and the continual raising of the degree of socialization of labor.

From the historical process of industrial development it can be seen that, in the primitive stage of workshop handicraft industries, as well as in the early stages of modern large-scale industry, enterprises were not on a large scale, there was only a simple specialized distribution of labor within enterprises, and the efficiency and speed of production was also not very high. As a consequence of this, enterprise management was relatively simple, and the form of management organization corresponding to this level of the productive forces was the "linear system" (also known as the "military system"), which practiced direct, departmentalized control. This form of management relied on a small number of people to carry out overall management, and management functions relating to such areas as production, technology and operational activities were all dealt with by individual directors at each level. Following the development of modern large-scale industry, management work became increasingly complex, and workloads became heavier and heavier, so that it was vital to implement the distribution of labor in management. All kinds of specialized management departments were gradually set up, and the form of management organization known as the "functionalist system" made its appearance. In this system, production was separately controlled by departments having various kinds of functions. This form of multifunctional control was not compatible with the further development of production, and so the "regional management system" was developed, which was an amalgamation of the "linear system" and the "functionalist system."

The productive forces of modern enterprises continue to develop, production tends toward automation and standardization, production processes become increasingly intensive, and the efficiency and speed of production have been greatly raised, while at the same time the scale of enterprises continually expands, market competition intensifies, and the content of enterprise management becomes daily more complex, thus requiring a corresponding correctness and promptitude in dealing with things, as well as great foresight. This has spurred on the tendency in the organizational form of enterprise management toward the so-called "matrix system," which represents the amalgamation of departmental management with functional management; as far as the content of management is concerned, this demands the eradication of the tradition of approaching problems by means of the specialized division of labor through departmentalization or ordering things according to function, and stresses the comprehensivization and the systemization of management, advancing the new concept of "comprehensive management."

This comprehensive management has as its special characteristics the management of the entire process of an enterprise's production and operations, the comprehensive analysis and handling of the many different factors which may affect the results of production operations, and the scientific prediction of future development trends.

To take quality management as an example, the traditional management method is to set up a specialized management structure for quality inspection, and to implement postproduction inspection of product quality, so as to insure that goods meet the prescribed standards of quality. This postproduction checking type of quality management, in its earlier stages was concerned primarily with the inspection of finished goods, but later evolved into the inspection of semifinished products, but the object of quality management did not progress beyond the process of manufacture. Following the development of production technology, and the continual increases in the speed and efficiency of production, on the one hand the modernization of quality inspection techniques was called for, and on the other hand a transformation was required, in quality management from postproduction inspection to forecasting and taking precautionary measures in advance; this gave rise to the use of mathematical statistical methods and to the corresponding methods of overall quality control. So as to gain precautionary control over product quality, the sphere controlled by quality management was extended from the process of manufacture to cover such preparatory processes of production technology as the supply of raw and processed materials. With the further advance of production technology and the further intensification of market competition, the problem of how to rapidly replace products so as to meet market requirements became a matter of life or death for the capitalist enterprises caught up in this fierce competition, and this meant that quality management could no longer be confined to the inspection and control of the quality of work in the manufacturing process, and that comprehensive quality management must be carried out instead, with the aim of raising the level of quality standards for the actual products themselves.

Comprehensive quality management is thus the management of quality at all stages of the process of production and consumption, and requires not only the continued checking and control of quality throughout the manufacturing process, but also the implementation of quality inspection during the processes of the marketing of products and their use by consumers, the prediction of market requirements and development trends; according to market requirements and consumer needs, enterprises should quickly alter the design of their products, draw up new quality standards and adopt new manufacturing techniques, so that they can produce new and more competitive goods, and get them onto the market quickly. In this way, a new advance in product quality is achieved in every cycle. This kind of quality management covers the whole process of an enterprise's production operations, from marketing to design, from production preparations to manufacture, and back to marketing again; all the departments of the enterprise must assume a certain amount of responsibility for raising product quality, so that comprehensive quality management comes into being.

Seeing that comprehensive management is the management of the whole process, it demands not only that the functions of every department of an enterprise be fully realized in the pursuit of the common management objectives, but also that the workers and staff of every department, from their various different posts, should show a common concern for, and actively participate in, management, so that comprehensive management must also necessarily be fully participatory management, for the best results can only be achieved by depending on the active participation and the mutual coordination of the entire body of workers and staff. Modernized management can no longer rely simply on a small number of specialized management personnel; reliance on the participation in management of the broad masses is an inevitable tendency in objective development, and only socialist enterprises possess the sufficient conditions for the implementation of this type of comprehensive management.

The content of enterprise management comprises many different aspects, and its work may be divided among many different management functions. However, if we synthesize these in a systematic way, they can be summarized as three main aspects of comprehensive management, and these are overall planning management, overall quality management, and overall economic management (or overall economic business accounting).

The socialist enterprise remains an economic unit carrying out commodity production. Its aim in production is to satisfy the needs of society, and at the same time it must create economic gains for the state as well as for the enterprise itself. The dual nature of the aims of production and the dual nature of commodities are identical, namely, on the one hand, to continually increase the use value of products according to the needs of society, and, on the other hand, to make efforts to reduce consumption of all kinds of materials and unstintingly increase the economic results of production operations. In order to achieve the former objective, overall quality management must be adopted; to achieve the latter objective, overall economic management must be implemented. Whether we speak of overall quality management or of overall economic management, the common concern and participation of the whole body of staff and workers is required before the best results can be attained.

The production operation activities of modern enterprises with a high level of socialization must be carried out in a planned way, and this is equally necessary for capitalist and socialist enterprises. However, under the socialist system, not only enterprises, but also the national economy as a whole, are highly planned; enterprises' plans are interconnected with state plans, and the necessary consequence of this is that there can be a higher level of planning within socialist enterprises than exists in capitalist enterprises.

Planning management is a sort of composite management, and should also be comprehensive planning management. In the first place, all the items of an enterprise's work should be centered on production and marketing plans; all work should be organized on the basis of plans and, once an overall balance has been achieved, these plans should become the enterprise's composite plan, coordinating and harmonizing all aspects of work and insuring the realization of the production and marketing plans. Second, precise differentiation of plans must be carried out for the realization of any plan: short-term plans are to insure the fulfillment of long-term plans, while department and section plans are to insure the fulfillment of an enterprise's overall plans. The more accurate the differentiation, the more effective it will be in guaranteeing the fulfillment of the plans. The precise differentiation of plans must ultimately be carried right through to each production process and each job; it must be carried right through to each individual worker and staff member. Thus, overall planning management must also be fully participatory planning management. Again, only by relying on the common concern and participation of the whole body of staff and workers can an enterprise put into effect genuine overall planning management.

Overall quality management is comprehensive composite management centered on the utilization value of commodities, while overall economic management is comprehensive composite management centered on the value of commodities, and thus overall planning management is comprehensive composite management which focuses on the whole process, from production to marketing, organizing every aspect of an entire factory's activities in production operations. If we adhere to these three aspects of overall management, we will have grasped the basis of complete management.

All these three aspects of management are also fully participatory management, and all rely on the concern by management for every member of the work force, and on everybody's participation in management. If every worker and member of staff, each in his own job, strives for quality, strives for economy, and moreover carries out his work and his production strictly according to plan, then enterprises can assuredly attain outstanding results in their production operations, with high quality, high output and low consumption.

To summarize what has been said above, the state nature, the democratic nature and the mass nature are the fundamental characteristics of socialist enterprise management. In specific terms, this means that we should: bring fully into play the subjective dynamic role of enterprises under centralized state guidance; set up a democratic centralist management organization under the guidance and supervision of the party, and rely on the participation of every member of the broad masses of workers and staff, in order to realize the three aspects of comprehensive management. If we can gain a correct understanding of these characteristics of socialist enterprise management, fully bring into play the superior nature of socialism, while selectively and discriminatingly absorbing advanced foreign management methods and adapting them for use in China's specific conditions, we will surely, within a relatively short period, be able to create a complete and characteristically Chinese system of socialist management science, in order to bring into existence the conditions necessary for the realization of Chinese-style socialist modernization.

ECONOMIC JOURNAL ADVOCATES COMPETITION IN ENTERPRISES

HK101510 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 11, 15 Nov 80 pp 35-37

[Article by Liu Shiwen [0491 0013 2429] and Yan Jun [7346 6511], staff of the headquarters of the Honghe Chemical Plant at Zigong: "Competition Enhances the Vitality of Enterprises"]

[Text] Is competition good or bad for socialist enterprises? To more and more people, the answer is affirmative. Indeed it is so. Many examples have proved that competition is an external stimulus for vitalizing enterprises.

Ours is a composite chemical plant. In the past, competition was not encouraged. Enterprises were not given any power to promote competition. It was always the same procedure from production to marketing and there was little development in the enterprises. Last year, our plant became one of the enterprises to experiment with greater autonomy. Since then we have had some achievements in economic activities. Competition, among other factors, accounted for this success. This vitality can be seen in the production and management of three of our products.

Survival in Competition

Bibasic calcium phosphate is both a good additive to poultry and livestock feed and a principal component in the industrial production of compound feed. In 1971, our workshop began trial production of bibasic calcium phosphate. In 1974, we met the standard set by the state and began exporting to some Scandinavian countries. In the next few years, the demand exceeded our supply.

However, a new problem arose in 1978. Our annual output of bibasic calcium phosphate increased from 400 tons to around 1,000 tons, yet it was no more competitive than before in the international market. The amount of export remained the same as in the beginning. As a result, there was a surplus of bibasic calcium phosphate in the warehouse. In early 1979, the surplus bibasic calcium phosphate already exceeded what was needed for export in that year. To regulate the national economy, the plant was obliged to suspend production of bibasic calcium phosphate as from April 1979.

Unable to find any solutions, the workshop spent 5 months trying to produce other goods. However, by September, the workers were again enthusiastic and the machines were back in operation. Bibasic calcium phosphate was being vigorously produced again.

At that time, the term "competition" had not yet been restored. Those who knew that bibasic calcium phosphate was again being produced said that bibasic calcium phosphate had been eliminated by competition and was reborn by competition. How did the staff of the workshop save the production of bibasic calcium phosphate from elimination in the international market?

In the second half of 1978, the Ministry of Foreign Trade arranged a meeting between the leading cadres of the workshop and some foreign businessmen. A Japanese businessman asked if we could produce special grade bibasic calcium phosphate. Compared with the existing grade, special grade bibasic calcium phosphate must contain 8 percent more phosphorus, 40 percent less fluorine and 50 percent less arsenic. The responsible cadres assumed that behind this demand for such high quality bibasic calcium phosphate there must be a large market. Hoping to earn more foreign exchange from the export and with encouragement and support from the headquarters, they promised to satisfy the Japanese request. First, they collected similar products from four countries for analysis. Then, from over 500 pieces of data, they made countless revisions in technology and equipment. After several months of hard work, they were able to produce the special grade bibasic calcium phosphate which the Japanese requested.

Everybody thought a big demand would follow. To their disappointment, the Japanese only ordered 15 tons of the bibasic calcium phosphate which was to be sent to them at intervals over 3 months. This amount was only 1.5 percent of our annual output of this product. Some people said it was not worth all the effort to produce such a small amount of bibasic calcium phosphate, others said we were inventing unnecessary variations and not producing bibasic calcium phosphate according to the set standard and so forth. At that time, the phosphate rock was of a low grade, so it was not easy to produce special grade bibasic calcium phosphate. More and more people wavered. Should we sum up our experience and go forward or give up and retrench? The members of the plant and the workshop, taking practice as the criterion, discussed two questions.

First, was it an unnecessary variation to depart from the set standard and produce according to market requirement? The majority of the staff believed that the set standard was issued by the state in the early 1970's with regard to our production capacity at that time and to the international market situation in the 1950's and 1960's. At that time and in the period that followed, it was in keeping with or basically in keeping with the demand. Therefore, the bibasic calcium phosphate produced at that time sold well abroad. Now the international market requirement has been raised, but our set standard has not. Our production is still geared to the old standard, so the sales situation has not improved. Through discussions, we realized that no matter what the standard, once it was outdated and became an obstruction to the development of production, we should depart from it by seeking truth from facts. We should start from the actual situation and produce what the consumers demand. This is in no way an unnecessary variation.

Second, how should we treat small business? The workshop made a comparison between the composition of bibasic calcium phosphate from several countries with what the Japanese required. They found out that what the Japanese required was either on a par with or superior to what these countries produced. And these products happened to be the more competitive ones in the international market. From this we recognized that although the Japanese order was of a small value, its effect was not. Since the quality of the special grade bibasic calcium phosphate was up to international standard, we need not worry about the prospect of future orders. It was unwise to go back to the old path just because the Japanese order was not for a large amount. If we clung "bookishly" to our erstwhile practices, some day we could even lose the contract for the annual export of 400 tons.

Through discussion and analysis, the staff of the workshop straightened out their ideas and regained confidence. They thought of new ways to solve the problem of low grade phosphate rock and persisted in the production of special grade bibasic calcium phosphate.

In the spring of 1979, the special grade bibasic calcium phosphate first attracted the attention of foreign businessmen at the Guangzhou trade fair. When the trade fair was over, the Ministry of Foreign Trade received one order after another from abroad. The bibasic calcium phosphate from the warehouse was soon emptied and production in the workshop resumed. In the first half of this year, Japan and the Philippines alone placed orders for 900 tons of bibasic calcium phosphate from us. The Japanese firm that had initially ordered 15 tons of bibasic calcium phosphate from us told us in a letter that compared with the bibasic calcium phosphate made in the United States, India, South Korea and Taiwan, ours was up to their expectation. "With great trust and hope," they requested us to supply them with 800 tons of bibasic calcium phosphate each month in the second half of this year and a total of 12,000 tons next year. They also offered a 20 percent price rise. At present, the most pressing question for the 1,000-ton-capacity workshop is how to expand production.

The revival and prosperity of the production of bibasic calcium phosphate shows that while market competition is a contrast to internal factors such as quality, it also serves as a comparison in terms of economic ideas and insight. If it had not been for the insight of the staff of the workshop, who saw the large trade potential from a small order, decided on a correct policy and immediately improved the quality of the product according to market demand, this workshop might still be struggling with the fear of being closed down.

Find a Way Out Through Competition

The methyl chloride produced by another workshop in our plant is a good organic chemical solvent and an extractor. It is widely used in the production of organic synthetic plastics, medicines and spices. Since we began to produce it in 1965, it has been under the state monopoly for purchase and marketing. As demand always exceeded supply, the staff of this workshop were eating "rice comfortably."

However in 1978, this product suddenly dropped in social status. In 1979, the state informed us that the proposed output of methyl chloride was to be 1,100 tons. In actual fact, only 419 tons of it had been sold by the end of June. Among the other contracted 681 tons, 468 tons were canceled due to high price and low quality. Judging from this, only 49 percent of the finished product could be sold and more than 50 percent had to be stored in the warehouse.

The reason for this was that we met strong competition both from factories in the country which produced more and better methyl chloride than before and some central departments which had imported methyl chloride from abroad.

From our setback in the face of this competition, the leading comrades of the plant and the workshop realized that it was a punishment that objective economic laws were imposed on us due to our stagnation and lack of improvement in the quality and price of methyl chloride for over 10 years. When the production of methyl chloride was under preparation, the responsible higher department considered installing a complete set of equipment for the production of new 4-fluoro plastic goods. However, when production was started, the product consistently remained 96 percent pure. Over the years, the responsible higher department ordered that the methyl chloride should be 99 percent pure so as to suit the requirements of synthetic 4-fluoro plastics. Yet we held the attitude that we did not have to worry about the sales of our product. So we did not bother to improve it. One plastics factory, after purchasing our methyl chloride, had to distill it before using it. In the process of distillation, 30 to 40 percent of the methyl chloride was lost, thus the actual price of the methyl chloride rose from 2,500 yuan to more than 3,000 yuan per ton. On the other hand, imported methyl chloride was over 99.9 percent pure and could be directly used in the production of 4-fluoro plastics. Its price was only around 2,300 yuan per ton.

In our discussion on the outlet for methyl chloride, two sides appeared, one in favor of "lodging a complaint," the other of "reporting a victory." The "faction in favor of lodging a complaint" maintained that we should complain to the central authorities and ask them to stop importing methyl chloride from abroad in order to protect the domestic industry. The "faction in favor of reporting a victory" said that only when we showed super grade methyl chloride with over 99 percent purity as proof of our ability to satisfy market requirements could we report our success to the central authorities which might then consider reducing or curtailing imports from abroad. They held that we should compete with the imported methyl chloride and try to eliminate it from the scene.

Under the leadership of the headquarters and with support from the higher responsible departments, the workshop took many concrete measures in production, technology and management.

First, a market research team was formed. It visited nearly 100 consumers in 19 provinces and cities both in the north and south of the country. Based on the opinions and requests of the consumers and the actual market situation, and with the focus on finding out the difference in quality and price between various brands of methyl chloride, the team proposed ways to improve production.

Second, the price of methyl chloride was twice readjusted on the basis of lowering production cost. The price dropped from 2,500 yuan to 1,800 yuan per ton.

Third, we publicized our product by advertising, actively improved the packaging, provided better service and strengthened the sales of small amounts.

The most important measure was that we set up a technology class to study ways of improving the production of super grade methyl chloride. The members of the class bore in mind that "the consumers are 'kings' and their requirements are our target." They took the standard of 4-fluoro plastics required by synthetic plastics factories as their target. After nearly 3 months of hard work, they were able to produce super grade methyl chloride with over 99 percent purity in early October last year.

Having read our report on super grade methyl chloride, the central departments concerned took measures this year to reduce the import of methyl chloride. Our plant produced about the same amount of methyl chloride as was imported. Cheaper than its imported counterpart, our methyl chloride sold well. We received orders from old and new consumers alike. This year we can produce at most 1,200 tons of methyl chloride, but the demand for it has already exceeded 2,000 tons. At present, the workshop is trying every means to cut down consumption and expand production so that it can produce more for the market.

The question of high price and low quality methyl chloride, not solved by administrative means for over a decade, was solved in a mere few months through competition. This shows that we should encourage and protect competition. For those products with low quality and high prices, we should deliberately introduce some advanced counterparts from abroad so as to press them into finding a new way out.

Seeking Development Through Competition

One of the major products of our plant is soda. It has been produced here for more than 20 years. We used to have another method of production. After the technological reforms in 1975, our plant became the second enterprise in the country to adopt the joint method of soda production. By joint method we mean one in which the synthetic ammonia, soda and ammonium chloride are used. Since this method was put into practice in September 1975, soda, ammonium chloride and ammonia water have been selling well.

However, the situation changed last year. There was a surplus of ammonia water, whereas originally it had been in short supply. This was due to the development of several large chemical plants in the province and small nitrogenous fertilizer plants elsewhere. We made a great effort to achieve a balance between the production and sales of ammonia water by lowering the price, improving the quality and delivering the product to the consumers, but all in vain, for our ammonia water was still slow to sell.

What could we do? Should we produce less ammonia? No. In our joint production, there must be a balance between the amounts of ammonia and soda. Less ammonia would mean less carbon dioxide, which would result in less soda and ammonium chloride. There is a fixed proportion between these three items. A change in one of them would upset the balance. Since we could not reduce the production of ammonia though it was not selling well, should we just dump it in the river? No, this would cause pollution and increase the cost of production which would be harmful to the state and the people.

The leaders and engineering-technological personnel of the plant soberly analyzed this situation. For many years, we had been used to "determining sales by production, listening to polite requests and seeing the smiling faces of the consumers." We were satisfied with the sales of our product, without being aware of our good and bad points or the present and future market. We were content to know neither our enemies nor ourselves. The advent of market competition sobered us up. We realized that it was unwise to persist with the same methods of production and management. We must know ourselves and conduct renewed self-analysis so as to maximize our strengths, otherwise we would not be able to withstand the currents of competition. Having analyzed the situation, we understood that if we continued to compete with the large plants in the province in the production of ammonia water, we would be permanently in an inferior and passive position. Our cost of production was lower than that of other plants and our scale of production was smaller. This internal factor could not be easily changed. We should avoid this shortcoming and foster our good points in order to transform our passive position. By good points we mean the joint production with soda. With some technological reforms and measures, we could change ammonia to soda. Soda had always been in urgent demand in both the domestic and international markets. There would be a broad scope for development for a long time to come. Therefore, we should start from this actual situation and maximize our strengths in the production of soda by avoiding the bad points and fostering the good points. We had earlier intended to expand soda production. Now, under the pressure of poor sales of ammonia water, the leaders were all the more inclined to do so. Early this year, with the support of the Department of Chemical Industries and the provincial and municipal departments concerned, we renovated the No 2 white limekiln which had been closed for many years. We used the carbon dioxide from lime burning to increase soda production and balance the proportion of carbon dioxide. Since May, carbon dioxide has been continuously transmitted from the white limekiln. More carbon dioxide means more absorption of ammonia. The production of soda and ammonium chloride rose by several dozens of tons per day. Increased soda also means relatively less ammonia water and so the balance between production and sales was attained.

The conditions in May and June reflected distinct economic effects. Without the carbon dioxide from the white limekiln in these 2 months, the output of soda would have been 14,000 tons and of ammonia water 16,000 tons. With the carbon dioxide from the white limekiln, 18,000 tons of soda, 18,000 tons of ammonium chloride and only 6,000 tons of ammonia water were produced. That means 10,000 tons of ammonia water was converted to 4,000 tons of soda and 4,000 tons of ammonium chloride. There was a drop in the surplus product and an increase in the product in short supply. This was indeed an unexpected turn. We spent 1 million yuan in renovating the white limekiln, which was equivalent to the profit on 10,000 tons of soda. We can certainly surpass the production target of 20,000 tons proposed by the state.

This shows that competition is a good thing. Without competition, conflicts will not be exposed and the human mind will not work so well. Through competition we understand and foster our strengths and avoid our weaknesses. If it had not been for the external pressure from competition and the internal motive of the expanded decisionmaking power, perhaps the enterprise would not have been so enthusiastic in dealing with the poor sales of ammonia water and developing the production of soda.

LESSONS OF BAOSHAN STEEL WORKS IN CONSTRUCTION PLANNING STUDIED

Shanghai JIEFANG RIBAO in Chinese 20 Sep 80 p 1

[Article: "Modernization Is Not Something That Can Be Bought, Economists Say; Shanghai Biweekly Economic Forum Considers It Necessary To Draw Experience and Lessons From the Policy Decision on the Baoshan Steel Works Project"]

[Text] The Shanghai biweekly forum on economic problems recently held a discussion of the important problems of Shanghai's economic construction brought forward by delegates at the 3d session of the 5th People's Congress. In particular, the discussion centered on the question of construction of the Baoshan Steel Works. It was held that modernization is not something that can be bought and that we should seriously draw experience and lessons from the policy decision on the Baoshan Steel Works project.

Among those speaking on the question of Baoshan Steel Works were Wu Shaozhong [0702 4801 0022] from the first economic research center of the Shanghai Academy of Social Sciences, Chen Minzhi [7115 2404 0037] from the departmental economic research center, Chen Jiangtao [7115 3068 3447] from the Environmental Protection Bureau, and Lui Qinglan [0712 1987 3482] from the Municipal Harbor Bureau. They set forth the following views:

Investments might top 22.7 million yuan. Answering inquiries the leadership of the Ministry of Metallurgical Industry said that investments in the Baoshan Steel Works might reach 22.7 million yuan. But circumstances indicate that investments might top this figure. The 22.7 million yuan estimate was made before the budgetary estimate for the Baoshan Steel Works was worked out. The figure did not take into account such factors as interest payment and price increase. Further, quite a few obvious items were left out. If mineral ores were to be produced in China, construction of mines would entail a considerable amount of investments.

The factory site chosen was the most unsatisfactory in terms of geological structure. On the question of choosing a factory site, it was Baoshan Steel Works' decision to choose the site before proceeding with geological prospecting. The results of drilling show that the sector from Baoshanzui to Liuhokou is the most unsatisfactory in terms of geological structure. Geologic maps of the past indicate that all sectors except the site of Baoshan Steel Works showed clay formations when drilling reached 20-30 meters deep. The geological structure there is very bad but since it was chosen as the factory site the only thing to do was drive imported steel piles. This operation alone involved a considerable amount of investments.

Economic results are not good. According to preliminary estimates, the cost of molten iron is 210 yuan per ton, which is much higher than the 145 yuan cost of products turned out by the first plant of the Shanghai Steel Works. The cost of coke is 132 yuan per ton, which is also much higher than the cost of approximately 70 yuan in the case of Shanghai Steel Works. Investments in Baoshan Steel Works average 3,115 yuan per ton of steel whereas investments averaged 1,342 yuan per ton of steel during the "first 5-year plan" period and 2,452 yuan during the "fourth 5-year plan" period. What will be the cost of Baoshan Steel Works' ultimate product (rolled steel)? The Ministry of Metallurgical Industry merely said it will not be too high. Consequently they took the view that total investments could be recovered in 13 years, but when making this determination they lacked the base of scientific calculation and at least they did not say whether interest payment was taken into account.

The source of raw materials is not determined. In the near future, Baoshan Steel Works will rely on foreign countries (five countries including Australia and Brazil) for imported iron ores, but no contracts have been signed beforehand. Some of the ores to be imported are no longer produced abroad. If we depend on iron ores produced at home, it should be remembered that large rich ores available to the Baoshan Steel Works have so far not been found in our country and, even if they are found, we must find ways to solve the problems of investments and transportation and tackle the new problem of technology and technique that will arise. Apart from this, the problem of supplying coke to the Baoshan Steel Works has not been satisfactorily solved.

Market for products is the cause of worry. The leading body of the Ministry of Metallurgical Industry said that construction of the Baoshan Steel Works is designed to cut down future import of rolled steel. However, the rolled steel produced by the Baoshan Steel Works is limited in variety, and it is not possible for the Baoshan Steel Works to make up the shortage of the kinds of rolled steel experienced in the course of carrying out our four modernizations program. The kinds of steel turned out by the 1.7-meter rolling machines of the Baoshan Steel Works and Wuhan Steel Works are needed by our country but the quantity of production is not large. If more is to be produced, there is the probability that products will be overstocked. The Ministry of Metallurgical Industry has never forecast market supply of and demand for various kinds of rolled steel. Besides, it should provide economic proof to determine which kind of rolled steel it pays to import.

Environmental pollution of Shanghai should not be overlooked. The leadership of the Ministry of Metallurgical Industry said: Baoshan Steel Works' emission standards are the ones adopted by Xinritie [2450 2480 6993]. But treatment of three kinds of waste by Xinritie is not the best in Japan. More importantly, the geographical environment of the Baoshan Steel Works is different from that of Xinritie. Xinritie is located on the seaside remote from large cities and its waste gas and waste water are discharged into the Pacific Ocean. Baoshan Steel Works is only 20 kilometers from Shanghai where environmental pollution has already assumed quite serious proportions and the population density is high. Baoshan Steel Works' emission standard for sulphur dioxide is not high but the total volume of emissions is not small. This plus the pollution of the city proper will increasingly worsen Shanghai's environment. Besides, the Baoshan Steel Works has not solved its problems of treating steel slag and industrial and domestic sewage which reach 800,000 tons a day. If these are not properly treated they will cause serious pollution of Shanghai's environment.

To draw water from Dianshanhu and Dongdaying is to seek far and wide for what lies close at hand. To solve the problem of water for production purposes, Baoshan Steel Works is prepared to build diversion works to draw water from Dianshanhu. Shanghai's fresh water resources are limited. The water drunk by the people of the whole city is the polluted water from the Huangpu River. In such a situation, to draw clean water from Dianshanhu for supply to the Baoshan Steel Works for production purposes can hardly be justified. Under such circumstances, Baoshan Steel Works, instead of depending on Dianshanhu for water supply, will use water from Dongdaying. To lay pipes for drawing water from any of these two sources will entail a large amount of investments. It would be better to take other technical measures for drawing water from the Yangtze River on the spot.

In addition, those present at the forum set forth some views of the relationship between Baoshan Steel Works and urban construction in Shanghai and that between Baoshan Steel Works and Shanghai's long-range plans. They took the view that in terms of site selection, product orientation, product scope determination, geological prospecting, preparation for design and construction, or technical and economic proof, the Baoshan Steel Works project appears to have been worked out in haste and has deviated from the principle of keeping within the limit of resources. It is a reflection of leftist thinking in economic construction. Some suggested at the forum that total investments in the whole Baoshan Iron Steel Works project are 3 times those in the 156 projects built during the "first 5-year plan" period and that the matter is of great importance and must not be dealt with carelessly. It was proposed that the departments concerned assume a responsible attitude to the state, carefully study and prove things and properly solve the problems mentioned above.

Present at the discussion were some 300 responsible persons of Shanghai's economic departments, economists, scientists, technical experts and teachers of institutes of higher learning. Li Peinan [2621 1014 0589], deputy director of the Standing Committee of the Shanghai Municipal People's Congress attended the meeting. Huang Yifeng [7806 6654 1472], president of the Shanghai Academy of Social Sciences, presided over the meeting.

PATENT LAW DISCUSSION MEETING HELD IN BEIJING

OW010236 Beijing XINHUA Domestic Service in Chinese 1316 GMT 29 Nov 80

[Text] Beijing, 29 Nov (XINHUA)--The State Scientific and Technical Commission and Chinese Patent Bureau recently held a patent law discussion meeting in Beijing.

To establish a patent system in our country, the State Council approved and transmitted last January the State Scientific and Technical Commission's "Request for Instructions on Establishing a Patent System in our Country," thereby officially inaugurating the PRC patent bureau. In April 1979, a special group was organized under the leadership of the State Scientific and Technical Commission to carry out the work of drafting a patent law. After more than a year of repeated revisions, a draft patent law has now been put forward. It was on this basis that the present patent law discussion meeting was held.

The more than 70 representatives from the various legal, economic, scientific, technical, educational, trade and industrial circles attending the meeting conducted extensive discussions on the question of establishing a patent system and the draft patent law. With everyone airing their own opinions, they conducted conscientious analyses of the advantages and disadvantages, as well as the gains and losses, of the patent system and of several articles of the draft patent law. They put forward many beneficial opinions and proposals.

Many representatives attending the meeting pointed out: Since it is necessary to expand to decisionmaking rights of the enterprises and to recognize the enterprises as commodity producers with corresponding independence in the course of the reform of economic system carried out by the state, it is also necessary to recognize the ownership of the enterprise or individual of its or his technical inventions. The patent system is a kind of scientific method to acknowledge and protect owners of inventions in accordance with the stipulations of law. We should discard the system's nature of protecting indiviudal monopoly and use its scientific method of management. Besides, in taking advantage of the international market conditions, it is also necessary to follow the principles pertaining to international trade and technical interchange, to stress prestige in trade and to respect invention ownerships. Therefore, the establishment of a patent system has become imperative, and we should actively create necessary conditions for carrying out such work as soon as possible.

Some representatives held: with the gradual deepening of the reform of our country's economic system and the continuous development of our country's international contacts, the establishment of a patent system is essential. However, under the present circumstances where our country's technical level is relatively backward and its industrial foundation relatively weak, it is necessary to consider more carefully the establishment of the patent system and the enforcement of the patent law. The pressing task at present is to establish a system of compensatory transfer of technical achievements, which not only solves the numerous practical problems put forward under the present economic, scientific and technical management but which creates necessary conditions for the transition of the system to a system under the patent law.

Some other representatives probed into the historic course produced by the patent system and the essence of this system. Weighing the gains and losses, they advanced some enlightening opinions aimed at putting the future work on a stable and scientific foundation.

What kind of patent system should our country establish? The representatives maintained that our country's patent system should meet the following few principles: 1. It should reflect China's characteristics, suit our country's socialist system and protect its interests. 2. It should be able to promote the development of our country's national economy and science and technology. 3. It should be conducive to arousing the enthusiasm of the people of the whole country and concerned with the interests of the state, the collective and the individual. 4. It should be conducive to the importation of advanced foreign technology and to the promotion of international trade and international scientific and technical interchange.

BRIEFS

HYDRAULIC ENGINEERING CORPORATION--Beijing, 14 Nov (XINHUA)--China's Ministry of Water Conservancy today announced it has established the Hydraulic Engineering Corporation of China (HECC) to undertake overseas river basin planning, hydroelectric engineering projects and water conservancy projects including Chinese aid-assisted schemes. Zhao Chuanshao, HECC general manager, said the corporation is ready to undertake the surveying, designing, construction and installation of water conservancy and hydroelectric projects, either as contractor or as subcontractor. It will also provide technical services and organize the export of complete sets of equipment for small hydroelectric power stations. He said, HECC is ready to cooperate with overseas businessmen. PRC ECONOMIC JOURNAL ON REFORMING TAXATION SYSTEM

HK080931 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 9, 15 Sep 80 pp 23-26, 62

[Article by Liu Zhicheng [0491 1807 1004]: "On the Reform of Industrial and Commercial Taxation System of Our Country"]

[Text]

I

Since the founding of our country, the industrial and commercial taxation system has undergone three major changes, which were effected by the political and economic developments at various times in history.

A new taxation system was instituted in 1950 after the taxation administration of our country had been unified. Upon the founding of the People's Republic of China in 1949, the earlier liberated areas saw different taxation systems being administered within various revolutionary bases while the newly liberated areas partly carried on with the old taxation system of the Nationalists. Categories of taxes, taxable items, tax rates and means of collecting taxes were all very different in various parts of the country. Thus the absence of uniformity in the taxation system made it unable to meet the demands of the country's political unity and rapid economic recovery and development. Because of this, article 14 of Chinese People's Political Consultative Conference common program stipulated: "State taxation policy should be based on the principles of guaranteeing material support for the revolutionary war, of taking care of the needs of recovering and developing production, and of national reconstruction. Moreover, the taxation system should be simplified and equity of tax burdens practiced." Therefore, the codes of national taxation administration were formulated according to the spirit as reflected in article 14, and the 14 tax categories devised accordingly were: 1) goods tax; 2) industrial and commercial tax (including business tax, revenue tax, hawker's license tax and provisional commercial tax); 3) salt tax; 4) customs duties; 5) personal income tax (not yet levied); 6) interest tax; 7) stamp duties; 8) inheritance tax (not yet levied); 9) transaction tax (including cotton, grains, handwoven cloth, herbs, livestock and various transactions); 10) tax on slaughtering animals; 11) property tax; 12) land tax; 13) special consumption tax; and 14) vehicle and ship licenses tax. In 1951, a tax on national marketed cotton yarn was levied. Thus tax policy and the tax system were basically unified. Unifying the tax administration was important to bringing finance and economics under unified control. It was also important to promoting economic recovery and development. Moreover, it played an important role in speedily reversing the difficult economic situation in the early days after liberation.

In 1953, a commodity distribution tax was imposed on a trial basis in order to simplify the collection of taxes. In the same year, our country entered into a period of socialist transformation. It was just at this turning point that the party Central Committee called for a national conference on finance and economics, which had historical significance. Moreover, the conference further required that the taxation system must be one that safeguards socialist and semisocialist economies; that utilizes, restricts and transforms capitalist economy; and that promotes collectivization. Consequently, the conference provided a clear direction for the implementation of the provisional tax measures. Under the new guiding principle, we made some adjustment in the taxation system, and adopted a policy of dealing separately with state-owned enterprises and privately owned enterprises. For instance, regarding income tax, private enterprises were required to pay it, cooperatives were given special tax allowances and state enterprises were exempted. With regard to business tax, a tax was imposed on private wholesale enterprises while state wholesale enterprises were exempted. Moreover, the state tightened its control over private industrial and commercial enterprises. Taxation during this period played an important role both in implementing the central authorities' guiding principle and in accumulating capital for the socialist construction.

In 1958, the socialist transformation with regard to ownership was basically completed, and, as a result, the internal economic structure underwent a fundamental change. In order to adapt to the new situation, a reform was carried out on the industrial and commercial taxation system, in which multiple tax with various rates was imposed on production and distribution cycles. Thus the taxation system was further simplified. Taxes—goods distribution tax, commodity tax, business tax and stamp duties--on volume goods sales were blended into a single category, namely, industrial and commercial unified tax, while in the industrial cycles and commercial retail cycles, taxes were levied only once. Later in 1959, due to a fall in the interest rate, tax on bank interest was revoked. In 1962, the State Council decided to impose a tax on country fair transactions in order to keep pace with the developing of the country fair trade. In 1966, the tax on cultural entertainment was revoked in an effort to expand propaganda work. Having carried out these reforms, the number of tax categories was reduced to only nine. They were: industrial and commercial unified tax, revenue tax, tax on slaughtering animals, tax on transactions of livestock, tax on country fair transactions, vehicle and ship licenses, real estate tax, custom duties, and salt tax.

In 1972, the taxation system was further simplified in accordance with the needs of the then existing situation. The industrial and commercial unified tax with its surtax, together with real estate tax, vehicle and ship licenses tax, salt tax and tax on slaughtering animals, were replaced by the present industrial and commercial tax. Moreover, tax on transactions of livestock and tax on country fair transactions were to be levied locally. Thus the number of categories of industrial and commercial taxes was reduced to six, that is, industrial and commercial tax, revenue tax, tax on slaughtering animals, real estate tax, vehicle and ship licenses tax, and tax on country fair transactions. In state enterprises there was only a single tax category, namely, industrial and commercial tax, while in collective enterprises two tax categories were imposed, namely, industrial and commercial tax and income tax. Real estate tax, vehicle and ship licenses, and tax on slaughtering animals were only imposed on some non-enterprise units and individuals.

The two reforms on industrial and commercial taxation system carried out in 1958 and 1972 respectively were aimed at the integration of taxes and the simplification of the taxation system. At that time, under the influence of ultraleftist thinking, it was erroneously thought that after the socialist transformation of the means of production was completed with the economic structure transformed into one of pure socialist public ownership, the role of commodity and that of the law of value were much reduced and that the economic regulating role of taxes basically disappeared. Moreover, the principal role of taxes was thought to be one of accumulating capital. At the time when the "gang of four" was on a rampage, acting in accordance with economic laws was deemed as either capitalism or revisionism and had to be criticized. Consequently, great confusion was caused in the people's thinking and what followed was that attention was only paid to the simplification of the taxation system with the number of taxes reduced and their role diminished. Some comrades went so far as to advocate the integration of taxes and profits, thus abolishing taxes altogether. Under the influence of this kind of thinking, it was only natural that both the economic leverage of taxes and the development of production were restricted.

The practice over the past 30 years proves that taxes had two roles to play at different times in history. It was not only a reliable means by which capital for public finance was obtained, it was also an economic lever with which government could intervene in production, distribution and consumption. The emphasis in taxation should be on how to bring the economic leverage of taxation into full play so as to develop production and stimulate consumption. We should not for a moment forget the experience for which we paid a great price.

II

Following a shift in the emphasis of our party's work, great changes in our economy have already taken place or are taking place. These changes pose new problems to taxation.

1. Our social economic structure has undergone great changes. With state ownership and collective ownership being our economic base, we now have individual business, joint venture, sole proprietorship, association and various other forms of economic ownership. With regard to production organization, we are now carrying out industrial reorganization and forging ahead toward cooperation with specialization in production. In the area of distribution, enterprises should be allowed to market their industrial products, thus making production directly linked to marketing. Meanwhile, agricultural-industrial-commercial form of joint enterprises are being experimented with in various places, and country fair trade is being developed. Besides these changes, there are also others, and together they pose new problems to taxation. All the new problems need to be carefully studied and new methods adopted.

2. Restructure economic management system and financial management system. Transfer power to local authorities and enterprises, and thereby expand their power. This is an important measure taken to properly deal with the relationship between the central and the local, and between the enterprise and the individual worker. The question of how to deal with the relationship between the central and the local, between the state and the enterprise in the area of fiscal power is one that requires an urgent solution. Taxation is an important means for distributing public revenue. It must be adaptable to the new conditions of a restructured financial management system and to the needs for expanding the decisionmaking rights of an enterprise so that the interests of the central and the local, the public finance and the enterprise, the state and the individual are guaranteed with each receiving its due portion. It must also work its way through distribution of public revenue to mobilize all positive factors, thus promoting the development of the four modernizations.

3. Hold firmly the policy of working in accordance with economic laws and practice economic management with economic methods. Moreover, raise management standard and make operations more successful. This is an important guiding principle in the development of production. Questions that concern with how to go about making taxation policy in the process of distribution better satisfy the demands of economic laws, and reflect the principles of economic management with economic methods, together with the question of how to utilize taxation as a tool to develop an enterprise and to stress economic accounting, need to be carefully studied along with economic theories. Moreover, viable means have to be devised to solve these questions.

4. Following increasing economic exchange with other countries, the import of advanced technology and equipment, the use of foreign capital and the employment of foreign specialists, we now have a situation in which profits are being made from foreign capital, interest charged on foreign capital, income derived from patents, high income given to some individuals and other sources of income found. The new situation makes it necessary to institute the appropriate taxation system, which should follow the principles of equity, mutual benefit, maintaining national sovereignty and economic interests.

5. Speedily develop productivity and at the same time raise people's material and cultural standards. Moreover, taxation should play a more effective role in the accumulation of capital. Owing to fewer tax categories, the existing taxation system cannot adapt itself to the above complicated economic situation. Moreover, it has no bearing on the business of an enterprise in many aspects such as the uses of capital, the formation of resources, cost management, distribution of profits and so forth. With regard to our country's taxation system dealing with foreign companies, we still do not have a complete set of rules. All of this makes it necessary to incorporate these elements into the taxation system and make necessary supplements. Let us take industrial and commercial tax and income tax for example. At present, the laws governing them are still provisional and have yet to be formally passed by the Standing Committee of the National People's Congress. This is obviously not in line with the policy of strengthening the legal system and fully developing the effects of tax laws. Therefore, the situation is such that the taxation system must be reformed.

III

In order to keep the taxation system paced with the objective economic development and further develop the economic leverage of tax, it is necessary to reform the existing taxation system. Below is a preliminary study of the questions concerned.

1. Question on the multiplicity and simplicity of a tax system. The multiplicity and simplicity of a tax must be viewed from the dialectic standpoint. The basic principle is to see whether or not it is beneficial to economic development, and not to be judged by personal will. During the historical stage of socialism, commodity production and monetary exchange still exist and the economic structure is complicated, especially when we are now expanding the experiment of increasing the decisionmaking rights of enterprises, which are beginning to assume sole responsibility for their own profits and losses. Under this situation, the historical role of taxation will be reduced if in instituting a tax system we only aim at simplicity. Therefore, we think in studying the tax system, procedures for collecting taxes should be simplified, thus reducing the taxing authorities and problems enterprises have in tax management. However, in considering the layout of a tax system, we absolutely should not aim at simplicity; we should, under the precondition of guaranteeing the full development of the economic leverage of taxation, retain whatever is necessary, and add whatever is necessary. Thus we allow each tax category to develop its role fully, which will effectively stimulate economic development.

2. Question on the combined role of taxation and price in regulating production and consumption. Price and taxation are the two important economic levers in a planned socialist economy. They are the tools with which socialist production, exchange and distribution are regulated and promoted. They should work together and supplement each other. Under the conditions of a socialist planned economy, it is necessary to adjust the relationship between demand and supply through the government price policy so that it can be properly dealt with. Working together with price, taxation is more flexible in regulating market demand. Therefore, in order to develop the role of price leverage, it is necessary to draw support from taxation leverage.

3. Question on regulating disparity in revenue and keeping profits of enterprises at a comparable level. At present, some enterprises producing the same goods, cause disparity in revenue. Undoubtedly, one of the causes lies in business management, yet differences in endowment of resources, equipment and other factors are also important causes. For the purpose of developing our socialist economy and expanding socialist production, all national resources of the country should be fully utilized and waste should be avoided whenever possible. However, we must be able to see, due to different endowment of resources, enterprises operating in areas with rich endowment of resources attain more profits with less processing labor and less productive labor. On the other hand, enterprises in areas with poor endowment of resources attain less profits with more processing labor and more productive labor. The disparity in revenue is very great. Therefore, the state should regulate the disparity in revenue caused by external factors through taxation—the economic lever, and channel the revenue from taxation into distribution, thus placing different enterprises in a

position where, with their own efforts, they are on the same comparable basis. Judging by preliminary considerations, it is appropriate to impose a tax on resources as a measure to regulate the disparity in revenue. There are two considerations contained in this measure. On the one hand, tapping national resources should be rewarded, while on the other hand, disparity in revenue due to different endowment of resources should be regulated. As for reward, all state enterprises, collective enterprises, joint ventures or enterprises set up with foreign capital, that utilize our national resources should be taxed. This should be a general tax. In other words, only units that tap areas with rich resources and cause a disparity in revenue should be taxed. Specific tax principles and methods will be made after some investigation and research have been carried out.

4. Question on the universality of taxation and the equity of tax burdens. Under the existing industrial and commercial taxation, different tax rates, which have bearing on price and accounting records, have been employed by the state for various products. This taxation reflects the universality of taxation and has played an important role in regulating the distribution of profits from production as well as in timely forming public revenue. However, it is lacking in the equity of tax burdens, which is mainly due to changes in the production structure. Multiple tax has occurred where products have many production links. Consequently, it hampers the development of specialization in production. Based on foreign experience, the solution to this question favored by most people is value added tax. That is to say, the value of already taxed raw materials and parts should be deducted from the value of a product and tax is levied on its residue value (the new value added by an enterprise). The advantages of this tax are:

a. It will basically solve the problem of multiple tax and the absence of equity of tax burdens as it exists at present in industrial and commercial taxation.

b. It will help to coordinate the economic interests of the state, the enterprise and the individual worker. From the viewpoint of taxation being involved in the distribution of national income, the proportion of tax levied after deduction of the value created by processing labor, is secure, while the proportion of profits retained by an enterprise is also secure. If an enterprise reduces material waste and increases the amount of added value, then the state will receive more proportionally, while the enterprise will retain more proportionally.

c. It will help to secure public revenue. Tax on added value has the advantage of possessing the quality of universality of taxation. All production units have to pay taxes if and when they receive revenue and have value added to their products. On the other hand, the universality of this tax not only can secure public revenue, it also can channel public revenue evenly, stage by stage into the treasury. On the other hand, the securing of public revenue can solve the problem of reduced revenue due to the development of associations by production units. From the standpoint of securing public revenue, reform of the taxation system is also considered to have positive significance.

d. It facilitates the securing of public revenue in various districts. As the industrial and commercial tax stipulates that some production units and those units that produce products jointly, though they secure revenue from their operations they do not pay tax locally. Thus public revenue of the locality concerned is effected. Consequently, disputes arise and the districts affected have a lot to complain about. When taxes paid according to added value, all production units that have value added to their products have to pay value added tax locally. In this way, local interests will be protected.

e. It helps to solve a series of complicated questions in the current taxation system. For instance, those questions related to taxes on simple processing, complicated processing, and further processing of a production item, on multiple cycle production and single cycle production, and on associated enterprises, can be more or less properly solved, thereby the taxation system is further simplified.

To sum up, the value added tax is one that levies tax at various stages of production, but does not create redundant taxation. Levying tax at various stages of production reflects the universality of taxation, in which taxation participates in the distribution of national income, while the absence of redundant taxation reflects the equity of taxation. The economic leverage of taxation is only effective through its participation in the distribution of national income. The broader and more appropriate its participation, the more effective an economic leverage it becomes.

5. Question on the form of the distribution of profits of state enterprises. At present, the distribution of the profits of state enterprises takes the form of national collecting and distributing. That is, all profits are turned over to the state, who redistributes them to those enterprises in need. Consequently, rights and duties are separated. We think it is necessary to replace the current measure of turning over to the state with that of paying enterprise income tax. The advantage being that the state obtains a certain proportion of an enterprise's profits, with the latter retaining the remainder. When this new measure takes force, then both the revenue of the state and the economic interests of enterprises will be legally protected. After the deduction from tax, profits will remain in the hands of the enterprise, which, because of knowing clearly its financial power, will be able to plan production and budget welfare expenditure. The more profits the enterprise attains, the more after-taxed profits it will retain. Moreover, its funds will be increased and workers' welfare improved. In this way, the interests of the state, the enterprise and the workers will become related, which will help to develop production and enhance the workers initiative. Owing to a uniform tax rate applied throughout the country, profits among enterprises will be made reasonably comparable to one another, which will facilitate the judging of enterprises' production and operation results. Moreover, enterprises will be stimulated to learn as well as to catch up with advanced enterprises, to explore potentials and to contribute more to the country.

6. Question on maintaining national sovereignty and dealing with matters concerning foreign countries. Following the introduction of the laws on Chinese-foreign joint ventures, foreign capital, equipment and technicians began to pour

into our country. Profits derived from foreign capital and high salaries of foreign personnel have to be appropriately regulated. According to international practices, the principles of equality and mutual benefit in business can only be implemented through taxation. This is acceptable to all. Under the present conditions, taxes can be imposed on revenue, personal income and business registration of joint ventures.

IV

At present, the urgent task facing us is the reform of the taxation system and further develop the economic leverage of taxation. Therefore, based on careful summing up of historical experience, learning from foreign experience and thorough study and research, we should gradually create a taxation system which will be able to meet the present conditions in our country. On the one hand, we should carry forward our heritage and fully acknowledge the results achieved in the current taxation system developed over the past 30 years. On the other hand, we cannot be conservative and remain stuck with the old system. The reform on the current taxation system should be carried out actively and properly in accordance with objective economic laws and the principle of practice is the only criterion for testing the truth. Under present conditions, we think there are two areas for reform. First, the current taxes, numbering a few, should be regulated and reformed in accordance with economic development. Secondly, in order to keep pace with economic changes and the development of foreign trade, some taxes should be brought back while introducing new taxes. Two assumptions can be made with regard to the layout of the taxation system. First, the current taxes should be regulated, reformed and summary reports be made on them. Moreover, laws should be introduced wherever and whenever necessary. With regard to the revoked taxes, those needed should be brought back while new ones are being introduced. The different roles of these new taxes in regulating production, marketing, the profits of an enterprise, personal income, the uses of capital and utilization of resources should be developed.

The conditions under which the reform of the taxation system is to be carried out are very complicated, which is especially true at a time when we are implementing the policy of readjustment, reforming, straightening out and uplifting our national economy. Many changes will take place in the structure of production. Moreover, there are still situations that we have not yet understood well. Therefore, our attitude toward the reform of the taxation system should be positive and our progress steady. At the present, the question that needs an urgent solution is the imposition of tax involving foreign countries. Laws should be quickly introduced so that the requirements of new developments can be met. The reform on other taxes should be based on thorough investigation and research. Moreover, it should be made through experiments and planning as well as be carried out step by step.

FINANCE AND BANKING

'JINGJI GUANLI': SICHUAN REFORMS BANK SYSTEM

HK100850 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 10, 15 Oct 80 pp 21-22, 24

[Article by Cong Gan [7895 3927]: "Situation Concerning the Reform of Bank System in Sichuan Province"]

[Text] In order to better develop the role of banks as an economic lever, the People's Bank system in Sichuan has carried out pilot projects on reforming the bank system this year.

In the 30 years since the founding of the PRC, the People's Bank in China, which is our state bank, has attained marked results in socialist production and construction. However, it should be noted that the "backbone" role of the bank in regulating socialist economy as stressed by Lenin many times has not been fully developed.

Strictly speaking, the existing banks only calculate accounts and thus act as accountants, and have not really developed their role as banks. There are many reasons: One is that the present bank management system has not been reformed in response to developments in the economic situation. One of the main problems is that the scope of credit loans has remained very limited. The present system stipulates that the fixed working capital required for investment in basic construction and production circulation in an enterprise is allocated by the Finance Department. The bank only provides short-term loans to meet temporary and seasonal requirements exceeding the fixed working capital of an enterprise, it cannot assist an enterprise in tapping its reserves or renovating or reforming itself. This has prevented the bank from enlarging its role. The second problem is that bank credit loan is a "free supply system." This means that the bank is obligated to provide loan funds for enterprise operations as soon as approval has been granted. Regardless of whether the enterprise is run well or not, or whether the goods produced are in short supply or excessive supply, the bank has to provide loans "according to plans." It lacks autonomy in using its funds and can usually only play the role of a "treasury" and cannot genuinely play the leverage role with its credit loans. The third problem is that the internal management of the bank "eats from the same rice bowl." Now there is centralized accumulation and allocation of credit loan funds, and there is centralized revenue and expenditure in financial management. There are no links between the internal management of the bank and the interests of the staff and workers of the unit itself. There is lack of coordination between the interests of the state, the units and individuals; responsibility and interests are divorced from each other. This has hindered the making of any improvements in banking management.

The above-mentioned problems hamper the development of rational and effective organization and use of social funds by the state and dampens the enthusiasm of bank workers at all levels and are not conducive for developing the bank's role as a lever. Viewed from the present conditions in Sichuan Province in particular and following the in-depth implementation of the policies of readjustment, reform, regulation and improvement and the in-depth development of increasing the decisionmaking power of industrial and commercial enterprises within the whole province, the bank faces a series of new conditions and new problems which urgently must be dealt with.

The Main Contents of the Present Reform

The bank is a comprehensive department of the national economy and the pivot for capital turnover in the whole country. It covers a wide area and involves set policies. Thus in reforming the bank system, we should adopt a positive attitude and maintain a steady pace; this reform should be developed from studies and then gradually carried out in close coordination with the reform of the entire economic system. At present, the content of the pilot project of the reform of people's bank system in Sichuan consists mainly of the following items:

(1) Reform of the planned management system of credit loans. There was state centralized control and allocation of loan funds in the planned management of credit loans in the people's bank in the past. Loans were divided into various categories and directive targets were sent down from one level to another. The deposits in the branch banks were submitted upward to the main branch for unified planning. The branch banks were not allowed to use their deposits. In accepting loan applications submitted by the branch banks the main branch had to send down the targets item by item to the branches. The branch banks could not regulate the surplus or shortage in the various loan funds. This planned system of centralized collection and allocation by the whole country rigidly controlled the branch banks and obstructed the regulation of social funds. The pilot project reforms which began this year stipulated the implementation of the new method of "unified planning, management at each level, setting up links between deposits and loans and control of balance." The main branch only sets a control index for the overall balance between deposits and loans for the branch banks for the entire year. Under the prerequisite of guaranteeing the implementation of the control index for the overall balance approved by the upper level, branch banks in the province can give out the surplus deposits as loans. There is flexibility in the regulation and use of the various categories of loan funds. After allocation as loans for working capital required by the industrial and commercial enterprises, the surplus deposits and credit loans can be allocated for medium and short-term loans for equipment according to the amount fixed by the upper level. Under the prerequisite of exercising centralized control in banking undertakings, the implementation of this reform can increase the authority and responsibility of the branches by coordinating use of credit loans, so that these banks become independent management units which are adaptable to local conditions. This helps arouse the initiative and enthusiasm of banks at all levels in the organization and allows for flexible use of funds.

(2) Provide medium and short-term loans for equipment. In the past, people's banks could only provide loans for working capital, but "had no authority" in providing funds for adding production equipment, carrying out technological reforms and increased reproduction in state-run enterprises. This reform has shattered old conventions. While the bank continues to provide loans for working capital, it also provides medium and short-term loans for equipment in industrial and commercial enterprises. This is a major reform in our credit system. Judging from the preliminary practice of the past few months, in order to realistically develop the economic results of medium and short-term loans for equipment, an enterprise and bank should insist on accomplishing the following points in handling these loans: insist on using these funds mainly for tapping reserves, renovating, reforming old plants and preventing the use of loans to fill gaps in investment in capital construction and extending the capital construction front; uphold the principle of selecting and supporting the superior enterprises and give priority to loans for items with small expenditure, rapid results, great profits or revenue and avoid blind loans which are providing loans without thoroughly investigating the soundness of the borrower; and insist on repayment of loans on schedule. The time limit of loans is generally 1 to 2 years and the maximum is 3 years; insist on the bank's autonomy in the examination and approval of loans. The various departments can put forth the request for loans from the banks. However, the approval of the loan and the amount and period of the loan should be determined by the bank in accordance with the stipulated conditions of loans and rights of examination and approval. In arranging loans, the bank must study with the departments concerned in the local economic committees beforehand, so as to develop a rational plan and prevent duplicate construction and production and avoid wasting resources and extending the front. The people's bank authorization of medium and short-term loans and funds used for equipment in Sichuan have been gradually implemented this year and the funds are being gradually allocated for use at present. This plays an important role in supporting production of goods in short supply and bridging current gaps in the national economy.

(3) Improve the management of loans for working capital. The loans for working capital in industrial and commercial enterprises at present are still an important category of loans. The main problem in this aspect is that there are many funds involved or used and the turnover is slow. The reform stipulates that the principle of "differentiating between targets and selecting and supporting the superior" must be implemented in the bank loans in various places so that there are support and restrictions for economic regulation and enterprise adjustment. It is necessary to gradually promote loans according to economic contracts and market demands based on national planning, urge enterprises to carry out production according to demands and under the prerequisite of upholding planned regulation, realistically do a good job in market regulation and bring into better play the role of the bank in protecting competition and combining enterprises. Meanwhile, beginning on 1 April this year, the bank has, in accordance with state regulations, stipulated an additional interest of 20 percent on overdue loans, an additional interest of 30 percent on funds exceeding the total calculated working capital and on loans for accumulated material resources in enterprises which have not been verified and an additional interest of 50 percent on loans for deficit in capital construction or renovation and reforms, so as to urge the enterprises to strengthen economic calculation and reduce the use of

capital. This is a major reform in the interest system in the bank. It will play an important role in further using the lever of interest rate in the bank to urge enterprises to tap reserves properly, cut down the accumulation of material resources and exercise economy in the use of capital.

(4) Reform the method of commercial loans. Before 1958, the bank handled loans to commercial and industrial enterprises in the same way and implemented the method of separate management of deposits and loans. Loans were examined and allocated by the banks. In 1958, it was changed to the present method of "joint deposits and loans" which is actually the method of current deposits and overdraft. According to this method, the enterprise opens a current deposit and overdraft account with combined deposits and loans and ascertains an overdraft limit per quarter (which is the rectified and calculated index of the amount of expenditure exceeding income in the finance of the enterprise and deficit which has to be made up by bank loans). Within this overdraft limit, the enterprise can withdraw money whenever required and the loans need not be examined or supervised by the bank. This is not favorable for strengthening economic calculation and improving operation and management in the enterprise or strengthening credit control and developing the lever role of credit loans. As far as reforms in this aspect are concerned, we are prepared to adopt the method of separate management of deposits and loans which means that deposits should be allocated to deposits and loans should be allocated to loans. Separate accounts should be opened for deposits and loans, and loans are examined and allocated by the bank. This urges the enterprise to improve its operations and management, and develops the lever role of bank credit loans. In this year, a small number of enterprises have been selected respectively in the two cities of Chengtu and Chungking. This will be gradually popularized after the experiences have been summed up.

In addition, there are the following reforms: (1) Improve the management method and settling accounts. The method of settling accounts and of "taking up the commission to collect money on behalf of other places" in the whole province has been ascertained. The enterprise can entrust the bank with the relevant documents in order to collect money on its behalf and then deposit the money in its account. If the billed unit refuses to pay, the payer and payee should settle the problem themselves. This urges the enterprise to strengthen its understanding beforehand and promotes a contract system. (2) Improve the method of cash control. According to the actual local conditions, the bank can properly raise the limit or amount of cash which the unit is allowed to pay and carry. The enterprises and units can purchase agricultural sideline products on the market with cash according to the regulations. (3) Economic accounting is implemented in the internal management of the bank. Banks at all levels must declare that they have on hand a certain amount to be used for credit loans. When a branch bank deposits or borrows money from the main branch, it must collect and pay interest according to a set rate. There must be periodic examination of the five economic targets of the use of funds, the quality of work, work efficiency and expenses and profits in banks of all levels and the withdrawal of enterprise capital must be based on the stipulated conditions and proportion. (4) Reform the management system of bank cadres. Cadre management in the people's bank system approved by the state includes the appointment, promotion, transfer, reward and punishment of cadres in banks at all levels. The system of the dual management of the people's bank and local management is being implemented with the bank system management having a greater voice, so as to bring into better play the role of the bank.

Enable the Bank To Truly Become the Lever for Developing Economy

The People's Bank in Sichuan has ascertained the criteria for judging whether the reform of this system is good or bad. The six criteria are: One, to determine whether there are more funds accumulated now than in the past. Two, to determine whether there is greater flexibility in the use of funds. Three, to determine whether the economic results derived from loans are better than in the past. Four, to determine whether successful experiences have been accumulated. Five, to determine whether the management level of the bank has been raised. Six, to determine whether people have been adequately trained.

Although the reform of the bank system in Sichuan is only in the preliminary stage, it has involved various tasks in the bank and the various economic levers of currency, credit loans, interest and settlement of accounts in economic life. This is closely related to the various departments and various enterprises in the national economy. This reform will thus bring about some new changes in various aspects. Emphasis must be placed on negotiations and discussions in doing things in the departments concerned and in particular, it is necessary to start from the overall situation in the national economy and carry out in-depth investigations on the bank system, enterprises, trades and market. We must pay attention to "minute observation" and dissection as well as to "overall observation" and analysis. We must be the "barometer" of the national economy as well as the "weather station" of production and construction and strive to raise the level of bank management and thus turn banks into an important lever for economic development.

GUANGDONG TRUST COMPANY CHARTER ADOPTED

HK030500 Hong Kong TA KUNG PAO in Chinese 2 Dec 80 p 5

[Report: "Guangdong Trust and Investment Company Charter Adopted"]

[Text] Yesterday morning the Guangdong Trust and Investment Company called the first meeting of its board of directors and adopted the company charter.

It was learned that the Guangdong Trust and Investment Company is a new-type integrated economic organization under the leadership of the Guangdong People's Government with a total capital of 200 million yuan. The company and the enterprises under it have the power of making decisions about personnel, finances, property, production, supply, sales and other matters. They operate on their own and are responsible for their onw profits and losses. Guided by our country's relevant laws and regulations and by the needs of Guangdong Province, they attract in various forms funds from abroad and from Hong Kong and Macao, introduce advanced techniques and equipment, and invest in industrial, agricultural and other construction undertakings. They serve the object of accelerating the modernization of Guangdong Province. The company is situated in Guangzhou Municipality. Should the need arise it can set up branches or agencies at home and abroad.

According to the quarters concerned, the company's functions and its ways of attracting investment funds are as follows:

1. The company invests in specialized construction projects. Guided by the construction plans of the Guangdong People's Government, it issues special investment bonds. Concrete measures for the issuance of such bonds will be formulated in line with the principle of equality and mutual benefit.

Enterprises devoted to specialized construction projects will practice independent accounting and share profits or losses in proportion to the money invested. The profits realized for the investors and the original sum of money invested, which is to be returned after the expiration of a set period of investment, can be remitted abroad through the Bank of China in the foreign currency originally used for investment.

2. The company enters into business with investors from foreign countries, overseas Chinese and Hong Kong and Macao residents in the form of joint ventures, cooperation and compensation trade assembling. With the investment funds received,

it can set up independent enterprises, invest in various businesses at home, or work with the domestic units and enterprises concerned along the lines of jointly operated or cooperative ventures. The company undertakes the import or advanced techniques, equipment, raw materials, and gear for construction, and the export of products for sale abroad, as far as the enterprises under it are concerned. It also imports and exports goods in general. It further offers to make loans.

3. The company receives and gives credit. In light of the development of its operations and the needs of the province, the company will obtain credit from financial institutions and companies in foreign countries and in Hong Kong and Macao, or from individuals. The amount of credit, the interest rate, the term of maturity, the form of payment, and so forth are based on an agreement signed by the company and the party concerned.

4. The company issues bonds in both RMB and foreign currencies. Details are given as follows: 1) The period of investment is 10 years, with the bonds carrying an interest of 8 percent. The money from the redeemed bonds may be reinvested. With the approval of the Guangdong Provincial People's Government, interest on investments which are regarded as savings may be exempted from income tax. 2) Foreign currency bonds are of two types, one in Hong Kong dollars and one in U.S. dollars. The former is HK$2,000 a unit and the latter US$500 a unit, with no limit set on the number of units bought. Principal and interest will be paid in foreign currency in which the bond is issued. 3) RMB bonds are to be bought with foreign currencies. Each unit is 500 yuan with no limit put on the number bought. Redemption at maturity will be in the Chinese currency. Interest payments will be half in RMB and half in foreign currencies. 4) The bonds issued by the company can be registered in a person's name and are transferable. According to a Chinese law, the legitimate successor can arrange for transfer with the company.

5. The company undertakes to answer queries and execute commissions. It charges service fees for executing commissions for companies, enterprises and individuals at home and abroad and for handling import and export procedures.

The board of directors of the company is its highest authority. The board has one chairman and some vice chairmen, managing directors and directors. The chairman is appointed by the Guangdong People's Government. Vice chairmen, managing directors and directors are nominated by the chairman of the board of directors, subject to the approval of the board of directors and clearance with the Guangdong People's Government. The board of directors meets once or twice a year. When the board is not in session, the managing directors are in charge. If the need arises, the chairman of the board of directors may call a board of directors meeting at any time.

The powers of the board of directors concern chiefly the following four fields: 1) The formulation and revision of the company's charter; 2) the nomination of the company's general manager and assistant general managers by the chairman of the board of directors, subject to the approval of the board of directors; 3) deciding on the company's operations, guidelines and plans and checking the implementation of the relevant guidelines and plans; 4) examining accounts at the end of the year. Meanwhile the company is introducing the system of holding the general manager responsible under the leadership of the board of directors. The general manager is responsible for the overall operation and administration of the company and makes regular reports to the board of directors and the standing office of the board of directors. The assistant general managers help the general manager in his work.

FINANCE AND BANKING

STRENGTH OF U.S. MONOPOLY GROUPS DISCUSSED

HK080358 Beijing SHIJIE JINGJI [WORLD ECONOMY] in Chinese No 9, 10 Sep 80
pp 23-30, 9

[Article by Zhang Jialin [4545 0502 3218]: "Some Changes of Strength and Combination of Monopoly Financial Groups in America"]

[Text] Along with the rapid development of science and technology in capitalist countries since the 1960's, the economic structure in the United States has also undergone great changes. While some new industrial departments arose, the industrial and commercial enterprises which were originally engaged in a single line of business expanded into conglomerates and diversified enterprises one after another. The widespread growth of a diversified economy led to a higher concentration of production and capital, thus bringing about new changes in the balance of power among the U.S. monopoly financial groups.

One of the important features of the current development of the U.S. monopoly financial groups is that the relations of the monopoly groups have become more complicated, mutual infiltration activities have become greatly intensified, and the distinctions between major monopoly groups are getting more obscure. Therefore, the postwar division of the top 10 financial groups cannot fully reflect the actual conditions of the American monopoly groups today. As a result of the changes in the balance of power, the American economy has been increasingly dominated by the eastern financial groups. Today, the powerful Wall Street financial groups in the east are still the supreme rulers of America.

1. Characteristics of Concentration of Production and Capital in America at Present Stage

The emergence of monopoly financial groups was a result of the concentration of production and capital. Apart from relying on enterprises which turned large sums of surplus value into capital and expanded their existing productive capacity, the concentration of production and capital was mainly accomplished through mergers. According to the views of American economic circles, the high tide of mergers appeared on three occasions in postwar American history. The first occasion was from the mid-1950's to the end of the 1950's when more than 3,000 enterprises merged; some 8,000 enterprises merged during the second period, namely from 1966 to 1970; and the third period started in 1978 and is still going on. In 1978, the number of mergers rose to 2,106 totaling more than $34 billion, and the merging of enterprises with assets of over $100 million numbered 80—twice as many as in 1977. In addition, conglomerate mergers--namely the merging of different trades and professions--became the major form of amalgamation, accounting for 53 percent of all such mergers carried out in the United States from 1952 to 1955, 72 percent in 1960 and 91 percent in 1971. All this brought about the growth of large enterprises which expanded and diversified their economies. Take Litton Industries as an example. Before 1954, it was only a small enterprise which produced electron tubes. Yet, after merging with other enterprises, it became a large conglomerate which now owns some 100 small companies with over 10,000 products ranging from aircraft carriers and electronic installations to medical apparatus, instruments and books. At present, most of the largest American industrial corporations, such as Exxon, General Motors, General Electric, ITT and Boeing have become conglomerates.

The rapid development of conglomerate mergers and diversified enterprises is one of the important features of the current concentration of production and capital in the United States. The reason is that in many industrial sectors, the monopolization of enterprises has intensified to such a high degree that the capitalists cannot compete with one another in the same department. As a result, they have to expand into other departments. Along with the development of science and technology, there is mutual infiltration with regard to designing, production and technology in various industrial departments. The monopoly capitalists realize that a diversified enterprise is more economical, more effective and more profitable than a single-product enterprise. Moreover, many monopoly capitalists find they would rather purchase the existing enterprises than invest in building new ones or repair the equipment because the former is much cheaper, more profitable and less risky than the latter.

At the present stage, another characteristic of concentration of production and capital in America is that financial capital has strengthened its control over industry and commerce. Financial institutions (the commercial banks in particular) are the core of the monopoly financial groups. Since the banking laws in America do not allow commercial banks to invest in nonfinancial enterprises, the commercial banks have tried every means to set up trust departments, handle trust funds (namely the assets entrusted by individuals or groups such as old-age pensions) and make use of other external funds to purchase shares of stock of commercial and industrial enterprises so as to expand their own operations. These trust funds have increased rapidly since World War II. In 1975, the trust funds controlled by the 300 largest financial institutions in America totaled $535 billion and rose sharply to $822 billion in 1976, corresponding to nearly 46 percent of the gross national product of the same year. The trust funds were so greatly concentrated that the 10 largest financial institutions in America accounted for more than one-fifth of the total volume of trust funds in the 300 financial institutions.

The monopoly financial groups take the buying and selling of shares in the stock market as an important means of exercising control over enterprises and corporations. Many financial institutions have used most of the trust funds to purchase the ordinary shares of stock of the corporations. (Generally speaking, each ordinary share carries the right to vote.) They can manage to control the corporations as soon as they succeed in collecting a considerable number of shares. As the shares of stocks in American corporations have been widely dispersed since World War II, hundreds of thousands or even millions of people have become shareholders of large corporations. Therefore, the financial institutions can exercise control over the industrial and commercial enterprises by holding a fairly small percentage of the shares. According to a monographic study made by the U.S. Senate in 1978, the financial institutions could exert a powerful influence on the policy of the corporation and personnel matters of the board of directors if they managed to control 1 or 2 percent of the shares which carried voting rights. In addition, the financial institutions could exercise further control over the corporations concerned by providing credits and sending their representatives to serve concurrently as members of the board of directors.

There is a strong tendency for financial institutions to spare no efforts to dominate the shares of American industrial and commercial enterprises. This means that more and more American industrial and commercial enterprises are in the hands of a handful of large monopoly groups. At the end of the 1940's, the financial institutions held over 14 percent of the total number of shares which were on sale in the stock market. By the mid-1960's the proportion increased to 23 percent and by the end of the 1960's, of all the American industrial and commercial enterprises, nearly half of the shares which carried voting rights were under the control of the financial institutions. The shares held by the 100 largest financial institutions were worth about $300 billion, accounting for four-fifths of the total number of shares owned by all the financial institutions. The commercial banks which hold the largest amount of shares (calculated according to the value of shares) are Morgan Guaranty Trust Company ($19.3 billion), First National Citibank ($13.7 billion), Bankers Trust Corporation ($14 billion), and Chase Manhattan Bank ($9 billion).

2. The Changes in Strength of U.S. Monopoly Groups

In the process of concentration of production and capital, owing to the emergence of the new phenomenon mentioned above, there are some changes with regard to the inner structure, interrelations and balance of power of U.S. monopoly groups. Of the former 10 largest financial groups, the strength of the Morgan Group and the First National City Bank Group is expanding rapidly, and their interests are mutually merged and infiltrated with those of the Rockefeller Group. These three large financial groups of Wall Street in the east are still playing the dominant role in the economy and political life of the United States. As for the rest of the groups in the east, such as Dupont and Mellon, and the Chicago Group of the central eastern region, they are, in varying degrees, subordinate to the large Wall Street financial groups. The other two major financial groups, Boston and Cleveland, are on the decline. Though the California Group in the west once had a powerful influence, it has been seriously infiltrated by the Wall Street groups in the recent years, thus becoming an appendage of the latter. Though the economy in the southern regions has developed by leaps and bounds, the major financial, industrial and commercial departments are controlled by the eastern monopoly groups. Comparatively speaking, weak as the southern monopoly groups are, they are intensifying their struggle with the eastern monopoly groups.

At present, it is hard to make an accurate estimate of the assets of the American monopoly groups. This is because: (1) The shareholders of many American corporations register their share certificates in the name of their consignee so as to conceal the real background of the monopoly groups. (2) The infiltration among the monopoly groups is very high, many enterprises are jointly controlled by two or more monopoly groups, and the members of the board of directors hail from different monopoly groups. Thus, the interrelationship of the groups is very complicated and it is very difficult to judge which monopoly groups a certain enterprise is subordinate to and to verify the accuracy of the actual strength of each monopoly group in a certain enterprise. (3) The U.S. Government has never published formal data concerning the relative strength of monopoly groups and the background of the enterprises. Herewith, we can only make a general introduction concerning the changes in the relative strength of the U.S. monopoly groups according to the investigative reports "On the Right To Vote of the Large Corporations" and "On the Composition of the Directorship of Large Corporations in the USA"--published by the Government Affairs Committee of the U.S. Senate in January and June 1978, respectively--and according to material from American newspapers and journals which reveal some information regarding the rivalry for dominating the corporations in the recent years.

(1) Large Wall Street Monopoly Groups in the Eastern Regions

The Morgan Group is a powerful and old financial group in the United States and its strength was once surpassed by the Rockefeller Group. However, the Morgan Group has made a rapid expansion in the areas of finance and trust and it has managed to control a large number of enterprises by using other people's funds. In addition, the growth of computers and other highly sophisticated technology in the past 10 years or so has strengthened the power of the Morgan Group. This is mainly because about 80 percent of the production of large-size electronic computers in the world are monopolized by IBM which is under the control of the group. As far as the competition for the domination of the enterprises--either in assets, numbers and influence--is concerned, the Morgan Group has now left the Rockefeller Group far behind.

Though the Morgan Guaranty Trust Company, the major enterprise of the group, has ranked fifth among the commercial banks in the United States and its bank savings are less than half those of Bank of America or First National Citibank, it still has the largest trust department in the country. By the end of 1976, it was the largest shareholder among the financial institutions in the country. According to an investigation made by the U.S. Senate, out of the 122 most influential enterprises, ranging from financial institutions to industries, retail enterprises, transportation and public utilities, Morgan Guaranty Trust Company had acquired the largest proportion of voting rights in 27 and ranked among the 5 largest voting-right holders in 56. Therefore, it is one of the most powerful financial corporations in the United States. What is more, Morgan Guaranty Trust Company has the largest proportion of voting rights in First National Citibank, accounting for 3.26 percent of the shares which carry voting rights. If all the shares of other financial institutions of the Morgan Group are included, it has a bit more than 10 percent of the shares in First National Citibank, thus playing a dominant role in the latter. At the same time, First National Citibank has acquired 2.63 percent of the shares which carry voting rights in Morgan Guaranty Trust Company, and there are 30 members of the board of directors holding posts concurrently in these two corporations. Therefore, we can hold the view that the Morgan and the First National Citibank groups are tending to merge with each other. In addition, these two financial groups have jointly controlled Bank of America, the largest commercial bank in the United States.

The Morgan Group has expanded its influence in several areas: In the financial circles, it has succeeded in gaining the largest proportion of voting rights in Chemical New York Bank and in the American Express and Travelers corporations, which were formerly owned by the Rockefeller Group. In the mining industry, the Westinghouse Electric Corporation, the major enterprise of the Mellon Group, came under the control of the Morgan Group after suffering an economic crisis in the early 1970's. As a result of the notorious scandal and financial crisis, the Lockheed Aircraft Corporation could not but accept the credit offered by Bankers Trust Corporation, thus falling into the hands of the Morgan Group. Textron Corporation, which was formerly owned by the Boston Group, has been jointly controlled by the Morgan and the First National Citibank groups. Besides, the Morgan Group has acquired a final say in the (Imber) Oil Corporation and Goodyear Tire and Rubber Corporation, dominating the United Aircraft Corporation, the biggest transportation corporation throughout the country, and Sears, Roebuck (formerly owned by the Chicago Group), the largest retail company in the United States.

Apart from the above-mentioned enterprises, the Morgan Group still controls some other major enterprises involved in different trades and professions (the financial groups with which the Morgan Group jointly controls the enterprise are shown in parentheses):

In financial trade, there are the following corporations: J. P. Morgan and Company, Manufacturers Hanover, Bankers Trust New York, Northwest Bank and Company (Dupont and Rockefeller groups), Prudential Life Insurance, New York Life Insurance, Connecticut General Insurance, Continental, Investors Diversified Savings (?) and so on.

In the mining industry, there are the following corporations: IBM (First National Citibank), General Electric (First National Citibank), ITT (Rockefeller, Chicago and Dupont), U.S. Steel, Union Carbide, Continental Oil, Union Oil of California, Coca-Cola, Pepsico, Chrysler (Rockefeller) and so on.

In transportation, there are the following corporations: United Airlines, PAN AM, Burlington Northern, Santa Fe Industrial, Southern Railway, Norfolk and Western Railway, and so forth.

In public utilities, there are the following corporations: American Telephone and Telegraph (Rockefeller and First National Citibank), Southern, Pacific Gas and Electric (California), Public Service Electric and Gas, Virginia Electric and Power, Columbia Natural Gas System (California) and so on.

In retail trade, the Morgan Group has exercised control over the K-Mart, the Union Department Store (First National Citibank) and so forth.

In recent years the economic strength of the Rockefeller Group has been on the decline. According to the value of its assets, Chase Manhattan Bank, the key enterprise of the group, is the third largest bank in the United States. However, in the case of trust business, Chase Bank is left far behind by the Morgan

Guaranty Trust Company. The Petroleum Industry was originally the pillar of the Rockefeller Group, but in recent years, some controlling rights of major petroleum companies attached to the group have been taken over by the Morgan and First National Citibank groups. In controlling the industrial and commercial enterprises, the Rockefeller Group has lagged behind the Morgan Group.

However, Chase Manhattan Bank has abundant funds and can manage to control the enterprises by providing commercial and industrial loans. Owing to the need for competition and expansion, many large corporations in the United States are seeking more and more funds. To this end, they have to rely on credit provided by the financial institutions. While issuing credit to a certain enterprise, though, they do not enjoy the right to vote in the debtor's enterprise. The financial institutions may ask the enterprise to provide confidential information with regard to its finances and assign some of its own members to serve concurrently as members of the board of directors of the enterprise. In so doing, they can exert great influence on the policies of the enterprise and manage to have a final say. According to an investigation made by the U.S. Civil Aviation Committee, by the end of 1976, the creditor's rights enjoyed by Chase Manhattan Bank in the 25 American airline companies were about twice as much as those enjoyed by the other banks. Through creditor's rights, it gained complete control of Eastern Airlines and played an important role in Northwest Airlines, both of which were attached to the Morgan Group.

The major corporations controlled by the Rockefeller Group are:

Chase Manhattan Bank, First Chicago (Morgan, First National Citibank and Chicago), New York Bank, First Boston (Mellon), Metropolitan Life Insurance Company, Equitable Life Insurance Company, Exxon, Standard Oil of Indiana (Morgan and Chicago), Raytheon, American Electric Power, Eastern Airlines, Commonwealth Edison, Texas Utilities (Chicago and Boston) and some others.

In recent years, the Rockefeller and the Morgan groups have further infiltrated each other. Chase Manhattan Bank held 1.43 percent of the shares which carry voting rights of Morgan Guaranty Trust Company, ranking second among all the shareholders. At the same time, the latter obtained 1,090 shares carrying voting rights in Exxon. Through different channels, such as sending representatives to serve concurrently as members of the board of directors, both the Rockefeller and Morgan groups are closely related and have succeeded in jointly dominating a number of important enterprises--American Telephone and Telegraph, which has the largest assets in the United States, ITT, Chrysler and so on.

Historically, First National Citibank Group was closely connected with the Rockefeller Group and has been under the control of the Steerman-Rockefeller families for a long time. Many American scholars hold the view that it is not an independent financial group but a bank attached to the Rockefeller Group. According to an analysis of various data available at present, First National Citibank should be taken as a group jointly controlled by the Rockefeller and Morgan groups or rather as a financial group closely connected with these two powerful groups.

At present, there are many representatives of the Rockefeller Group on the board of directors of First National Citibank. For instance, two representatives from Exxon (one of them is Calvin, chairman of the board of directors) were sent directly, and the other five indirectly, to serve concurrently as members of the board of directors. From the Metropolitan Life Insurance Company there is one representative (vice chairman of the board of directors) directly holding a concurrent position and 22 indirectly. From Chase Manhattan Bank there are 18 representatives indirectly serving concurrently as members of the board of directors. On the board of directors of First National Citibank, there are also representatives from Equitable Life Insurance Company, New York Life Insurance Company and First Chicago Bank.

First National Citibank is also connected with the Morgan Group. This is mainly because First National Citibank and Morgan Guaranty Trust Company have merged, and these two groups have jointly controlled a large number of financial institutions, commercial and industrial corporations, such as Bank of America, Atlantic Richfield, Phillips Petroleum, Eastman Kodak, Caterpillar Tractor and J. C. Penney.

The trust business of First National Citibank has developed rapidly. Calculated according to trust assets, First National Citibank leaped to first place in the United States in 1976 from fourth place in 1974. By the end of 1976, the trust assets of the bank totaled $26.1 billion, half of which were invested in the ordinary shares of industrial and commercial enterprises. Thus, a large number of major enterprises were under the control of First National Citibank.

The major corporations controlled by First National Citibank Group are:

First National Citibank, the First Bank System, Atlantic Richfield (Morgan), Caterpillar Tractor (Morgan and Dupont), Eastman Kodak, Phillips Petroleum (Morgan), United Technologies, Xerox, Boeing Aircraft, Minnesota Mining and Manufacturing, Bendix, Grumman Aircraft, J. C. Penney (Morgan) and so forth.

Of the three large Wall Street financial groups mentioned above, the Morgan Group has the most powerful influence in various economic sectors, followed by the Rockefeller Group and First National Citibank successively. Comparatively speaking, however, the Morgan Group is loosely organized and its political influence is not as large as its economic influence. What is more, in the Morgan family, "political stars" such as Nelson Rockefeller and David Rockefeller have never emerged. Therefore, the Morgan Group has to draw support from the political strength of the Rockefellers. Considering that the interests and the sphere of influence of these two monopoly groups are about the same, there is not much difference with regard to their policies. Patterson, chairman of the board of Morgan Guaranty Trust Company, is a member of the Foreign Relations Committee headed by David Rockefeller. Since the days of the Kennedy administration, the Morgan and the Rockefeller groups have exercised control over the presidential elections. In 1974, they launched a campaign to drive Nixon out of office. There is a tendency for the Morgan and the Rockefeller groups to ally themselves with First National Citibank, which is closely related with these two groups, and form a united Wall Street Group. They often coordinate their policies and actions to influence the American political situation and are united as one in entering into rivalry with the newly rising financial groups in the western and southern regions.

(2) Financial Groups in the Eastern and Central Western Regions

Though the Dupont and the Mellon groups in the eastern regions and the Chicago groups in the central southern regions still control part of the major industrial enterprises, their strength has expanded rather slowly. What is more, in the matter of finance the Dupont, Mellon and Chicago groups have relied, to varying degrees, on the large Wall Street groups and have actually become an appendage of the latter. This is an inevitable outcome of the further concentration of the production and capital in the United States.

At present, the Dupont Group is still exercising control over General Motors, the industrial corporation which has the largest sales volume in the United States and the Dupont Corporation, the largest chemical corporation. Thus, it plays, to some degree, an important role in the American economy. However, its finance capital is very weak and it has relied on support from the Morgan Group for a long time. The banks of the Morgan Group often deal with the negotiable securities of the enterprises owned by the Dupont Group and provide the trust services. In addition, the Morgan Group has held about 4 percent of the shares which carry voting rights in General Motors (second only to the Dupont Group, holding 7 percent of the shares) and has sent three representatives to be members of the board of directors.

The major corporations controlled by the Dupont Group are:

Security Pacific, Detroit National, General Motors, Dupont, Middle South Public Utilities, Detroit Edison and so on.

In recent years, having been squeezed out by the large Wall Street groups, the Chicago Group has been more or less crippled. The Illinois Continental National Bank, the key enterprise of the group, was infiltrated by the Morgan Group, and the other important bank, First Chicago National Bank, came under the control of the Rockefeller Group. At present, the Chicago Group is actually subordinate to the Morgan and the Rockefeller groups.

Some major enterprises controlled by the Chicago Group are:

Illinois Continental National Bank (Morgan), Texaco (Dupont, Morgan and First National Citibank), Standard Oil of Indiana (Rockefeller), Bethlehem Steel (Morgan), Florida Power and Light and so forth.

The Mellon Group is one of the monopoly groups which keeps the family characteristics, and there is not much change with regard to the strength of this group in recent years. The Mellon National Bank, the key enterprise of the group, ranked 16th among the commercial banks in the United States in 1978. However, it was very active in expanding trust business. By the end of 1976, it owned trust assets of $14.4 billion, surpassing its own bank assets, and ranked 6th among American financial institutions. Of the industrial mining enterprises controlled by the Mellon Group, the most important one is Gulf Oil (ranking 9th among the 500 large American industrial enterprises). Since World War II, the Mellon Group has increasingly relied on the financial support of the Rockefeller Group. The Rockefeller's banks issued the negotiable securities for the Mellon's enterprises, assigned representatives holding concurrent posts as members of the board of directors in the enterprises and jointly controlled a large number of enterprises.

In recent years, there have been few changes in the industrial and mining enterprises controlled by the Mellons. It was only in 1978 that the Mellon Carborundum Corporation was swallowed up by the Morgan Kennecott Copper Corporation at the expense of $0.6 billion.

In addition, on Wall Street in New York, some small financial groups which are mainly engaged in banking investments are currently developing at a high speed. Among them, the most outstanding are the Lehman Brothers and Goldman-Sachs. Both of these are controlled by Jews. Though their assets are not enormous, they hold a considerable amount of trust assets (by the end of 1976, the Lehman Brothers Corporation acquired trust assets of $1.7 billion), often underwrite negotiable securities for large companies, poke their nose into the merging of large companies, or issue long-term bonds for foreign governments. Therefore, their economic strength cannot be overlooked. Meanwhile, they have an important impact on American political life through the Jewish circles.

Other eastern and central western financial groups, such as Boston, Cleveland and some local financial groups, have further declined in recent years. They no longer play an important role in the political and economic life in the United States.

(3) Western and Southern Financial Groups

Since the 1950's, the economy in the western and southern regions has developed by leaps and bounds, thus giving rise to a large number of new industrial centers and billionaires well-known all over the country. With their powerful economic strength, the agents of the western and southern financial groups have spared no efforts to become the master of the White House, and these groups were once the eastern financial groups' rivals who could not be underestimated. Some American scholars even hold that the power of America is shifting to the western and southern regions.

However, the allegation of "power shifting" is inaccurate. According to the analysis of various data and materials, the western and southern financial groups by and large have to hang onto the coattails of the eastern financial groups, and American political and economic power is still under the control of the latter. There are two reasons. One is that though there are some large financial institutions in the western and southern regions, they are far from being able to control all economic activities in these regions. Take Bank of America as an example. It has large assets and enormous deposits. However, it is mainly engaged in the savings business and has few trust assets. In these two regions, there are no large insurance companies or investment banks as in the eastern region, and trust business is very poor. Thus, the financial institutions there can hardly put the large industrial and commercial enterprises under their control. Very often they run short of capital and have to seek aid from the eastern financial groups. Therefore, they are restricted and controlled by the latter. The other reason is that most of the large industrial and commercial enterprises in the western and southern regions, such as Atlantic Richfield and Boeing, belong to the eastern financial groups. One of the important reasons for the rapid economic development in these regions is that a large number of enterprises owned by the eastern financial groups have increasingly been shifted to these areas. Of the 500 largest American corporations, only 84 corporations' headquarters were located in the western and southern regions in 1970, but they increased to 117 in 1976. From 1970 to 1976, headquarters or main bodies of 450 corporations were moved to Tennessee and 180 transferred into the Houston area. Take Georgia as another example. Some large banks in that state are under the control of the Dupont Group. The two largest enterprises in the state--the Coca-Cola and Lockheed Corporation plants--are attached to the Morgan Group. Since the 1960's, the Rockefeller Group has vigorously infiltrated Georgia. Atlanta, the state's capital, is called "the Southern Rockefeller Center." Therefore, the eastern financial groups still hold a dominant position in the economy of the western and southern regions.

The California Group is currently suffering blows and infiltration from the eastern financial groups. The largest controlling rights of Bank of America, its key enterprise, have been dominated by the Morgan and the First National Citibank groups (which hold respectively 2.88 percent and 2.47 percent of the shares carrying voting rights, thus achieving absolute superiority over the bank while Bank of America itself and the other banks attached to the California Group have acquired only 1.27 percent of the shares). A large number of corporations attached to the group, such as Security Pacific National Bank, Georgia Pacific and Lockheed Aircraft have been in the hands of the eastern financial groups. At present, the major industrial and mining corporations controlled by the California Group are Standard Oil of California, Getty Oil, Western Oil and Litton Industries.

The economic strength of the Texas Financial Group has expanded substantially. Currently, the major financial, industrial and mining corporations controlled by the group are Dallas First National Bank, Dallas Republican National Bank, Houston First National City Bank, Tenneco, International Harvester, LTV, Safeway Shops, and Texas Instruments. It is noteworthy that the assets of the three banks owned by the group mentioned above are growing very rapidly. Along with the expansion of the economy of Texas, the group is becoming a force which can withstand the eastern financial groups.

3. New Characteristics of the Changes and Development of the Monopoly Financial Groups

The growth of productive forces and the intensification of concentration and monopolization have brought the monopoly financial groups not only changes in strength and combination but also some new characteristics.

(1) The Business of the Financial Groups Is Diversified

The concentration of postwar American monopoly capital is accomplished to a great extent through comprehensive mergers. As a result, the management and operation of the financial groups are becoming more and more diversified with each passing day. In a certain long period before and after World War II, the American monopoly groups emphasized certain areas in their management and operations. The Rockefeller Group had the oil industry as its mainstay for a long time; the emphasis of management and operations of the Morgan Group was on the iron and steel industry and the railway; the Mellon Group laid stress on the oil and aluminum industries; the Dupont Group on the chemical industry; and the Chicago Group on trade and professions concerning agriculture. Now the emphasis of the management and operations of the Morgan Group is no longer placed on the iron and steel industry and railways. Since the 1960's, apart from expanding the oil industry, the Morgan Group has had vital interests in such fields as electronics and electric appliances, automobiles, chemical products, conventional and sophisticated weapons, aviation and the domestic retail trade, thus becoming a comprehensive large financial group involving almost all kinds of production.

By using its powerful financial strength after World War II, the Rockefeller Group, which made its family fortune by relying on oil, penetrated rapidly into other economic sectors. At present, its sphere of influence has reached such departments as chemicals, electronics, aviation, ammunition, atomic energy, food and public utilities. The assets of the Dupont Group in automobiles and public utilities have greatly surpassed those of its traditionally run chemical industry.

(2) The Overseas Interests Are Widely Dispersed

It was an allegation in the past that the overseas interests of the Morgan Group seemed to be in Western Europe, while those of the Rockefeller Group were in Asia, Africa and Latin America. However, this allegation is considered to be far from the truth. In seeking cheap raw materials and manpower, the monopoly groups are shifting more and more production and marketing links to foreign countries and their overseas interests are widely dispersed. Viewing the layout of the multinational corporations, the manufacturing industry of the Morgan Financial Group is dispersed mainly over Western Europe, Japan and Southeast Asia, while its oil industries in the Middle East and Africa (the Continental Oil Corporation has in recent years invested considerably in Asia). The overseas interests of First National Citibank are dispersed over Western Europe, Canada, Asia, Africa and Latin America as well as Oceania. There is not much difference between the overseas interests of the Morgan Group. The Rockefeller is also a financial group whose interests are widely dispersed. At present, the Middle East and Latin America are used as its bases for extracting oil, and Western Europe, Latin America, Oceania and Canada are the bases for its oil refineries and the chief market for its oil products. The Rockefeller Financial Group has also invested in the manufacturing industry in Western Europe. Its large manufacturing companies have practically set up subsidiary companies in Europe. In a word, the overseas interests of the major American financial groups are overlapping and crisscrossed. They are all multinational and transregional financial groups.

(3) The Infiltration Within the Financial Groups Has Intensified

The existing American companies have already been carved up. To continue to compete, the monopoly financial groups have no other alternative but to infiltrate into the enterprises of the other party. In recent years, the financial strength of various large financial groups has increased considerably. The capital (the trust assets in particular) which can be allocated is larger than at any time in the past. This enables the financial groups to buy the shares of other enterprises or to provide loans, thus gaining partial controlling rights of the enterprises attached to the other financial groups. With the exception of some companies which are solely run by the financial groups bearing a strong family tint, the great majority of the large American corporations are jointly controlled by more than two financial groups. For instance, IBM traditionally belonged to the Morgan Group, but the Watson family, the boss of the corporation, has intimate connections with the Rockefeller Group and often depends on the financial support of the Chase Manhattan Bank. So the Rockefeller Group has fairly large controlling rights over IBM.

Besides, with the management and operations as well as production being diversified, the emphasis of management and operations and the distribution of interests of the major financial groups are becoming more and more similar and they increasingly overlap. An investigative report issued by the American Senate in June 1978 pointed out that, owing to the emergence of mutual concurrent membership on the board of directors in large numbers, the large American companies were, to varying degrees, related to one another. By analyzing the conditions of 130 large American corporations, the report held that there were a thousand and one links between these companies. Among these, the most outstanding are 13 companies (including Morgan Guaranty Trust Company, First National Citibank, Chase Manhattan Bank and Bank of America). As far as their relations with other companies are concerned, 240 people were directly appointed as concurrent members of the board of directors, and 5,547 were indirectly appointed. This means that under the conditions of fierce competition, financial groups can exchange information and achieve, to a certain extent, coordination in formulating financial and pricing policies at the expense of the interests of the small and medium-sized enterprises. In so doing, the American economy will further develop into higher concentration and monopoly.

The intensification of infiltration among the financial groups has brought about structural changes within the financial groups. The multi-interest groups have emerged in different economic sectors, inner control has become looser, and a unified authoritative guiding center will no longer exist. Therefore, the American monopoly groups are facing a process of disintegration and reorganization.

4. Some Manifestations of Contradictions Among the Monopoly Groups

The intensification of infiltration among the monopoly groups cannot ease the contradictions and competition among them. The manifestations and struggles are somewhat different from those in the past.

At present, except for the traditional contradictions between some of the eastern financial groups and the newly rising western and southern groups, more contradictions exist among transregional and transfinancial groups. The contradictions are reflected in the conflicts within the same departments or among various departments of different financial groups. Three contradictions are as follows:

(1) Contradiction Between the Large Multinational Corporations Which Give Priority to the Overseas Market and the Monopoly Groups Which Stress the Domestic Market:

These multinational corporations include the large-sized oil, automobile, electronics, electric, chemical and food industrial and mining corporations, which are attached to First National Citibank, Rockefeller, Mellon, Chicago and the western and southern financial groups, as well as the commercial and investment banks which provide funds for multinational corporations. On the one hand, they advocate strongly that all restrictions on free trade and direct investments abroad be abolished. In order to make the products of their subsidiary companies abroad enter the American market, they call for reduction of tariffs and the abolition of all restrictions on imported goods. In their domestic economic policy, they stand for the policy of deficit financing and dollar devaluation so as to serve their expansionism. On the other hand, the industrial and mining corporations and local financial institutions--including steel, textile, domestic oil extraction and some small and medium-sized enterprises of the Morgan, Rockefeller, Chicago, Boston and western and southern financial groups--which are unable to expand abroad, have to lay emphasis on the domestic market. They call for the implementation of the policy of protectionism and restrictions on the free circulation of commodities and capital. In their domestic economic policy, they are in favor of the policy of a balanced budget and are against deficit financing.

(2) The Contradictions Between the Regions and Departments Related to the Production of Munitions and the Production of Products for Civilian Use:

Many large corporations of the eastern financial groups, such as General Motors, General Dynamics, Lockheed, Boeing, Goodyear Tire and Rubber, United Technologies, McDonnell Douglas, Raytheon, and Grumman are all well-known large enterprises engaged in the production of munitions. Some western and southern regions also depend on the production of munitions and military services to stimulate their economies. The contradictions between those corporations on the one hand, and the civilian industrial departments which mainly produce consumer goods, the service departments, the public utilities and transportation and communication departments on the other, are reflected in the competition for federal government expenditures. At present, of the expenditures of the American Federal Government, military expenditures and social welfare expenditures are the key items (they constitute over three-fourths of the general financial expenditures). If military expenditures go up, social welfare expenditures will be cut back and vice versa. The chief beneficiaries of military expenditures are the departments of munitions production and the regions involved in the production of munitions. So they call for armaments expansion and war preparations as well as the increase of military expenditures. The funds for social welfare expenditures flow mainly into the consumer market. Therefore, the departments not involved in munitions production of the aforesaid financial groups advocate the expansion of social welfare and oppose any increase of military expenditures.

(3) Contradictions Between Energy Industrial Departments and Nonenergy Industrial Departments:

In recent years, due to the increasing demand for petroleum and the policies of the successive American governments who favor the oil industry, the profits of the oil industrial departments have drastically increased. This has aroused dissatisfaction among the monopoly groups of other industrial departments. On the one hand, large oil corporations have consistently sought the increase of domestic oil prices, the abolition of price controls and the reduction of tariffs. On the other hand, the other industrial departments demand that domestic oil prices should be kept at a low level and tariffs on oil increased, thus restricting the profits of large oil corporations. The second phase of the energy plan put forward by President Carter in July 1979 demanded that taxes on windfall profits should be levied on the large oil corporations. The bosses of the large oil corporations of Exxon, Mobil, Standard Oil of Indiana, Getty and so on, rose in opposition to the plan immediately. On the contrary, the chiefs of General Electric and other industrial enterprises had no objection to it.

The inner contradictions among the monopoly groups have naturally affected both the foreign and domestic policies of the American ruling circles. In recent years, some important events in American political life, such as the resignation of Nixon, the debates on military strategy and policies toward Russia and "the Lance scandal" after Carter took office, and so on, are related to the conflict of interests among the monopoly groups. Owing to the role of the law of uneven development of capitalism, the balance of power of the monopoly groups is bound to change further. Their struggle for maximum profits and the fight for control of the nation's political machinery will increasingly become more acute and complicated with each passing day.

SHANGHAI FACTORY GETS BANKS' HELP IN COLLECTING DEBT

Shanghai JIEFANG RIBAO in Chinese 25 Nov 80 p 1

[Article by Wang Jiefa [3769 7132 4099]: "Discipline in Economic Affairs Strictly Enforced by People's Bank Branches in Shanghai and Hegang Assisting the Limin Machinery Plant in Collecting 1.26 Million Yuan Debt"]

[Text] Comrades of the Shanghai branch and the Hegang branch in Heilongjiang Province of the People's Bank fully asserted their role as finance and property committee personnel by firm action in the interest of discipline in economic matters; they actively assisted the Limin Machinery Plant of Shanghai in recovering 1.26 million yuan of outstanding payments and in addition collected a penalty due in this case, thus promoting production and winning the praises of the factory.

In March 1979, the Limin Machinery Plant of Shanghai had signed a supply contract and in fulfillment supplied seven sets of 800 HP adjustable conveyer belts for coal exploitation to a certain unit in Hegang in Heilongjiang Province. The seven sets of machinery were to cost 2.66 million yuan. After their punctual delivery, the Limin Machinery Plant commissioned the People's Bank in Hegang to collect the purchase price as stipulated. Up to the end of December 1979, the said unit made three payments of a total of 1.4 million yuan to the Limin Machinery Plant but defaulted on the balance of 1.26 million yuan.

The Limin Machinery Plant is a small factory with an allotted working capital of only 1.55 million yuan. To ensure reproduction at the factory, it was forced to borrow 1.1 million yuan from the bank. Inspite of many letters, many telegrams and the dispatch of a special emissary to the Hegang unit to urge payment, nothing could be achieved.

After gaining a full understanding of the situation, the Shanghai Branch of the People's Bank, at the beginning of last September, sent someone to Hegang to get in touch with the economic committee and the local branch of the People's Bank to enlist their effective support. The Hegang unit made two excuses for delaying their payments, one was that the quality of the delivered machinery was defective, and the second, that they lacked sufficient capital. The Shanghai People's Bank representative, assisted by the relevant local agencies, investigated the matter and confirmation was obtained that the machinery supplied by Lemin had already been properly installed and had shown no signs of defects. The Hegang People's Bank also found out from the financial records at the local Bureau of Mining that the

Hegang unit in question was not at all short of capital. On the basis of these findings, the Hegang People's Bank became convinced that what had occurred was a violation of the discipline that is to prevail in state financial settlements. To safeguard the just interests of both sides of the purchase contract and to strictly enforce the system of state financial settlements, they exercised the powers vested in them as a financial management agency to order the said unit to pay the outstanding amount of 1.26 million yuan, and furthermore imposed a penalty at the rate of 3 pro mille per day, amounting to 190,000 yuan, according to the relevant regulations of the People's Bank of China Head Office, thus bringing this case of a 501-day delay of payment to a satisfactory conclusion.

FINANCE AND BANKING

BRIEFS

URBAN BANK DEPOSITS UP--Beijing, 12 Dec (XINHUA)--China's urban bank deposits reached 27,500 million yuan by the end of November this year, 7,200 million yuan more than at the end of 1979, the People's Bank of China announced today. The deposits average 230 yuan per capita for the 120 million city dwellers, the bank said. Meanwhile, the total volume of retail sales was up 15.8 percent in cities and towns from January to November this year compared with the same period of 1979. The bank said that more than 30 percent of the total deposits are fixed for six-month, one-hear, three-year and five-year periods. Urban savings deposits have increased year by year. A 10.6 per cent increase was registered in 1977 over 1976 while this year's deposits are expected to be 34 per cent more than last year's. Li Shutian, director of the deposit department of the bank said that savings deposits have become the most stable funds in the Chinese bank. FINANCIAL THEORISTS VIEW NATIONAL ECONOMY--Kunming, 15 Dec (XINHUA)--China must cut back on capital construction to balance the budget during her ongoing national economic readjustment, a national meeting of financial theorists proposed in Kunming, capital of Yunnan Province, southwest China. Some 200 specialists at the fourth national forum on financial theory attributed China's deficit of the past two years to over-extended capital construction in violation of the basic rules of socialist economy. To change this situation, the maintained, the state must curtail capital construction. They pointed out that, at present, capital construction was virtually out of control because of a lack of coordination between authorities at various levels who had the right to approve capital projects. The economists said the state must draw up unified regulations governing financing of capital construction throughout China. The meeting also discussed financial and tax reforms and relations between the economic infrastructure and distribution systems. [Text] [OW150710 Beijing XINHUA in English 0701 GMT 15 Dec 80]

'AFP' REPORTS HONG KONG'S INTEREST IN PRC OIL

OW091113 Hong Kong AFP in English 0916 GMT 9 Dec 80

[By David Lan]

[Text] Hong Kong, 9 Dec (AFP)--Hong Kong is gearing up for the likely oil boom that is shaping up in the South China Sea right on the city's doorsteps.

After a French firm signed with China for drilling in the Tonkin Bay, six American firms did the seismic surveys and 42 international firms tendered for drilling rights off South China, the black gold seems gushing from wells in the mind's eyes of businessmen and government officials alike.

They see two ways in which Hong Kong may contribute to China's development of its offshore oil wealth--by acting as a rear base for support and logistic supplies and by setting up an oil refinery.

The American Chamber of Commerce here has already set up an energy committee to focus on Hong Kong's contribution to the development of energy resources in South China. It is charied by Mr W. Gage McAfee.

Mr McAfee said as a support base, Hong Kong may assist in offshore survey and drilling by flying in equipment, supplies and crew to work boats and providing shore accommodation and, of course, rest and recreation.

This was further boosted enthusiasm first stirred up by earlier reports that China has already struck oil in several [word indistinct] noticeably in the Pearl River estuary, neighbouring Hong Kong.

The powerful Hong Kong and Shanghai Banking Corporation acted through its Merchant Bank subsidiary, Wardley Ltd, has set up a joint venture, Cluff Oil (Hong Kong) Ltd, with London-based Cluff Oil.

Other Hong Kong partners in the venture are said to include Rubus Co Ltd, Inchcape Far East, Ltd, Granill Trust Ltd, John Swire and Sones (Hong Kong) Ltd and shipping magnate Sir Y. K. Pao's Holbrook Investments Ltd.

Nor is the Hong Kong Government far behind. Its advisory committee on (economic) diversification urged the development of a supply base in Hong Kong and promptly appointed London's Pasco Engineering Ltd to study oil exploration support activities for Hong Kong with preliminary reports already handed in.

Fresh from his successful talks with the Guangdong (Provincial) Power Company on the feasibility study of building a nuclear power plant in the province north of Hong Kong, Sir Lawrence Kadoori, chairman of Hong Kong's China Light and Power Company Ltd injected more enthusiasm.

"Hong Kong may well become the logistic base and even refinery centre for China oil," he said.

There are, however, dampers to Hong Kong's hopes. Sir Lawrence said himself that China is now planning oil support bases near Hainan Island and elsewhere in which foreign firms are likely to be involved.

Mr McAfee also said his committee members would like to visit some potential support bases in South China, including a base in Zhanjiang near Hainan Island, Shehou in South China across Deep Bay from north of Hong King [as received] and Shenzhen, just across the border from Hong Kong.

Observers here believed that it was in China's own interests to refine its own crude oil before exporting it so as to maximize its earnings of foreign exchange.

The same reasoning went for support bases inside China who would earn more foreign exchange rather than spending it at bases in Hong Kong.

Positive and optimistic, Mr Michael Morrow, publisher of Hong Kong's petroleum news magazine, gave three reasons for Hong Kong's role in China's development of offshore oil:

First, its efficient infrastructure of international communications and transport, second, its facilities of comfortable accommodation, and recreation and schools for oil executives and their families and, third, its entrepreneurial talents, technical skills and financial capability.

His argument finally boiled down to one word--efficiency. "Oil exploration is highly specialized and incredibly expensive, with the rig rental alone running at 40,000 U.S. dollars a day and logistics support must be maintained on 24-hour basis and any in efficiency would be very costly."

According to him, the oil fever is spreading there, following positive efforts of foreign oil firms in the South China Sea.

Total, the drilling arm of Compagnie Francaise de Petroles, which has signed with China for a 10,000-square-kilometer field in the Tonkin Bay should start drilling this month and big U.S. oil firms (Amoco, Arno, Exxon, Phillips, Standard of California and Texaco) have made seismic surveys in 1979-80 [words indistinct]. Total Chine, S.A. has already set up an office in Hong Kong and has taken 30 luxury partments in the Newrodl complex as the first indication of the move to Hong Kong by foreign firms, he added.

ENERGY

BRIEFS

YU QIULI ON OIL SHORTFALL--Beijing, 5 Dec (KYODO)--China will be unable to meet its oil production target of 106 million tons next year, Vice Premier Yu Qiuli said Thursday. Yu made this disclosure in a meeting with Japanese Minister of International Trade and Industry Rokusuke Tanaka, Japanese Government sources said. China has already made it known that it cannot increase oil output until 1987, but this is the first time China has said it will cut production next year. MINERAL RESOURCES

GOLD, COPPER-NICKEL, CHROMIUM FOUND IN XINJIANG

Beijing GUANGMING RIBAO in Chinese 13 Oct 80 p 2

[Article: "Mineral Resources of Gold, Copper-Nickel, Chromium Verified and Found in Xinjiang"]

[Text] Our reporter Huang Dongyuan [7806 0392 0337] reports: The Geological Bureau of Xinjiang Uighur Autonomous Region, based on available forces and conditions, has shortened the front line of geological prospecting and concentrated forces on prospecting for mineral resources urgently needed by the state and occupying a predominant position in Xinjiang. In the first 9 months of this year, they verified and discovered mineral resources of gold, copper-nickel and chromium. The field geological prospecting tasks assigned by the state have either been fulfilled or have nearly been fulfilled.

In recent years, the Geological Bureau has sent geological personnel to find gold ores but in the geological prospecting work there was never a breakthrough. This time the 7th geological brigade with stronger technical forces was assigned to the job. During April and May they found outcrops of large gold ores. Accordingly, the 5th geological brigade and part of the 1st geological brigade were sent to step up prospecting there. Soon they found several tens of outcrops of quartz containing gold and initially verified several medium gold ore areas. This opened up great prospects of ore finds and filled the gap of gold ore reserves in Xinjiang. The industrial departments concerned have started extraction work there. In June and July of this year, the 4th geological prospecting brigade discovered rich copper-nickel ore areas with good prospects in the Altai Mountain area. From an ore deposit already verified it is inferred that the prospective reserves of copper and nickel are up to the scope of medium and large ore deposits. The average grades of copper and nickel contained in rich ore layers are respectively up to 4.9 percent and 4 percent. Further, the geological workers of this Geological Bureau have verified chromium ores which form a compact whole with the chromium ores previously found in Tuoli County, forming large chromium ore groups with more than 1 million ton reserves.

So far, the Xinjiang Geological Bureau, having cut down general survey items and shortened the front line, has saved prospecting expenses by more than 700,000 yuan compared with the corresponding period of last year.

BEIJING MEETING DISCUSSES CONSTRUCTION, DEVELOPMENT OF CAPITAL

OW280754 Beijing XINHUA in English 0729 GMT 28 Nov 80

[Text] Beijing, 28 Nov (XINHUA)--Beijing's development should be based on regional planning that includes Hebei Province, Tianjin and Tangshan, in the view of engineer Wang Huabin, vice president of the Chinese Architectural Society.

"While making Beijing's municipal construction plans," Wang Huabin said, "the whole region around Beijing should be taken into consideration."

He made the proposal at the end of a three-day discussion among scientists, scholars and professors on a draft construction program for the chinese capital. The meeting started November 24.

Participants discussed a draft plan for Beijing, which emphasizes scientific, cultural and educational undertakings. Under this plan, the city will not develop noisy and polluting industries, and heavy industry will be kept at the present level. The old city will be reconstructed step by step, the layout or near suburbs will be readjusted and greater efforts will be made to develop the further suburbs. The program envisions that by 2000, the city's population, now eight million, will be stabilized at around 10 million.

Seventy-five experts in city planning, communications, geology, water suppy, energy, systems engineering, geography, landscaping, environmental protection, economy, population and protection of historical relics participated in the meeting and raised proposals.

The experts also moved to promulgate a law on municipal construction to ensure that a final plan is strictly implemented.

Zheng Xiaoxie, chief engineer of the State Administration of Urban Construction, called for efforts to preserve characteristics of Beijing as an ancient capital.

Zhang Kaiji, chief engineer of the Beijing Municipal Construction Designing Institute, and Zhu Zixuan, associate professor Qinghua University, held that the old city's symetrical pattern with the building complex of the forbidden city (now the palace museum) as the central axis should be maintained, and appealed for careful protection of historical relics.

This is the second wave of discussions on the reconstruction of Beijing. The first one took place right after the secretariat of the Central Committee of the Chinese Communist Party laid down guidelines for Beijing's municipal construction in early May.

The draft program will be further revised according to proposals made at the discussion, and the revised version will be submitted for further discussion and finalized some time next year.

NATIONAL MEETING ON HOUSING HELD IN FUZHOU

OW161230 Beijing XINHUA in English 1212 GMT 16 Dec 80

[Text] Fuzhou, 16 Dec (XINHUA)--A housing credit plan run by the Guangzhou (Canton) Sewing Machine Factory has been cited at a national meeting as an example of what can be done to ease China's acute housing shortage.

Housing officials were told at the meeting in Fuzhou, capital of Fujian Province, that the factory credit plan has provided housing loans totalling 55,000 yuan for 80 families since last November.

Workers pay monthly instalments to the fund administered by the factory management and are entitled to borrow up to 2,000 yuan each.

The Fuzhou meeting agreed to urge factories throughout China to follow the example of the leaders of the Guangzhou Sewing Machine Facotry who used money from the company's welfare fund to get the housing scheme started.

The ban on private house building, imposed throughout China in the late 50's was lifted in Fuzhou in June last year, setting the pace for the whole country.

The Fuzhou meeting was told that families in 110 Chinese cities and towns had contributed to the national housing drive in the past two years, by building housing with a total floor space of 3.3 million square meters. Roughly in the same period, government builders completed apartments with a floor space or 90 million square meters and work is underway on another 80 million square meters.

In Nanyang City, Henan Province, 500 families have built homes on three sites requisitioned for the purpose by the municipal government. The houses are built on a plan supplied by the city construction bureau, and the municipality has undertaken to build shops and service facilities on the estates.

In other cities, local governments have supplied private householders with building materials and transport.

As yet, no private building is being done in the capital, Beijing, but officials of Beijing's trade union council said today that factories and other major work units had built housing for their workers with a total floor area of 1.08 million square meters by the end of September this year. A few days ago, Beijing Municipal Government announced it had completed 42,000 apartments as far this year and expected to build a total of 60,000 by year's end.

BEIJING CAPITAL CONSTRUCTION TO BE KEPT WITHIN RESOURCES LIMIT

Beijing BEIJING RIBAO in Chinese 26 Oct 80 pp 1, 4

[Article: "Capital Construction in the Capital Must Be Kept Within the Limit of Resources"]

[Text] In the course of readjusting the national economy, while the whole country is cutting down the scale of construction, capital construction in Beijing is increasing at an unprecedented rate. More and more large-scale, high-standard, and demanding construction projects are being put forward. Municipal building tasks for 1980 have already reached 20.35 million square meters. According to preliminary estimates by the responsible department, the total next year will exceed 30 million square meters. At the time Beijing was liberated in 1949, the total floor space of all houses in the city proper and suburbs did not exceed 20 million square meters. Under no circumstances is it possible to build one and a half times the number of houses in old Beijing in 1 or 2 years.

The key to undertaking capital construction according to resources lies in honestly "estimating our resources." It is essential to have a correct idea of how great our "resources" really are. We must proceed realistically in arranging the scale of construction. The present large-scale capital construction tasks far exceed the practical capabilities of Beijing urban construction and are running into contradictions difficult to resolve. The main reasons are:

1. It is very difficult to arrange for land for construction purposes.

Beijing city is already very large. Within the 750 square kilometers from Shijingshan in the west to Dingfuzhuang in the east, and from Qinghe in the north to Nanyuan in the south, except the districts already built, the rural houses, ditches, roads that have to be kept, the farmland and vegetable plots that must be kept, the railroads, highways and traffic yards and stations that must be built, the rivers and lakes to be dredged and the public parks and green areas to be expanded, remaining land available for building houses is less than 40 square kilometers. This area of less than 40 square kilometers is already insufficient to accommodate the cultural, sports, and health facilities, as well as the commercial and badly needed services, and other such everyday facilities which will be needed by newly constructed housing, so there is simply no surplus land available for building other new construction projects.

Even if it is handled this way, the density of housing construction will still be very high and the area of farmland, vegetable plots and green areas to be kept will obviously be too small. Further, it will be very difficult to arrange livelihoods for those peasants whose land has been taken over by the state. Under the circumstances, it is already very difficult to take over farmland for housing construction.

Yet, the constructive projects various parties want to be built in Beijing are ever on the increase. They want about 80 percent of these projects to be built in the urban districts, and, for various reasons, they refuse to build them in other localities. If arrangements are made for these projects, inevitably they will take up the land to be used for building residences, commercial, cultural, educational and health facilities and public utility facilities to redress the imbalance between "the bone" and "the flesh," inevitably take up the urban greenery belts, high-yield farmland and vegetable plots that must be kept. The central area of the city and some 10 industrial areas in the periphery will soon form an "airtight" whole and the layout of community-style urban districts will be upset. It will adversely affect planned construction of residential housing with necessary domestic facilities and aggravate the contradiction concerning the supply of vegetables to the city. Nor will it meet the war preparation and antiseismic requirements.

2. Municipal public utilities are falling further and further behind.

Beijing public utilities including urban roads, water, heating power, public traffic and telecommunications and electric supply are increasingly strained. Some public utility services are far behind what is needed and others have all along been operating at overload volume. For example, urban water sources are inadequate. The volume of surface water and ground water that can be opened up is not enough to meet the needs of industrial and agricultural production and domestic needs. With ground water excessively tapped to meet needs, the water table has sharply fallen at the rate of half to one meter a year, and some wells are already dry. The sewage daily produced in the city has in the main been drained without treatment into rivers and ditches and in some districts there are no sewage conduits at all. The increase of urban roads is far behind the increase of vehicles and the roads are increasingly congested.

Owing to lack of municipal public utilities, many houses already built cannot be put to use, causing a great waste. Although the state has increased allocation of special investments and materials in recent years, owing to sharp increase in housing construction, the municipal public utilities are unable to meet the needs of the houses completed each year. Not only do we have shortages from the past, there are now new shortages as well.

3. Far exceeding the limit of manpower and material resources.

Capital construction contingents in Beijing District have nearly 300,000 staff and workers. The 4.66 million square meters floor space completed under the 1979 capital construction plan was the peak level reached so far. Considering the increase of medium, large and high-standards projects, the increase of investments and the increase of the amount of labor for construction tasks, from now on the floor space of the projects completed each year will not show much increase, if any. Apart from this, we must discontinue the practice of transferring construction contingents from other areas to Beijing. The reasons are that before their transfer to Beijing the problem of their working and living arrangements must be solved, and that for several years to come they will not be able to work independently. At the same time their transfer to Beijing will increase the population of the capital. To recruit large numbers of unemployed youths in the municipality to swell the ranks of construction contingents is the normal way of replacing and reinforcing the contingents of construction workers in this municipality. But it will be necessary to go through a process of building a rear base, including job training and construction of structural parts plants and processing plants. No buildings can be erected simply by relying on huge crowds of people and adopting a "human wave strategy." To be sure, the construction units should do everything possible to tap their potential and increase their labor productivity and rate of projects completed.

At present, the overall supply of local building materials may roughly satisfy the needs of 5 million square meters of general building projects to be completed a year but do not meet the needs of tall buildings and high-standard construction projects.

Such is the present state of urban construction in Beijing. This suffices to show that urban construction in Beijing is confronted with a serious problem of readjustment. If construction tasks are arranged beyond the practical limit, the consequences will be quite serious: 1. The planned layout of urban districts will be upset and the urban district will grow larger and larger. We shall follow the same disastrous road of lopsided development witnessed in certain capitalist cities. 2. It will be impossible to fulfill such enormous construction tasks. To concentrate the extremely valuable and limited capital construction investments of the state in Beijing will adversely affect the great cause of national construction. 3. Even if some houses are completed, they cannot be put to use for want of public utilities, thus causing great waste. 4. The capital construction front will be further stretched, so much so that none of the construction projects can be completed and they are simply left there to fight a war of attrition. 5. Attempt and efforts to readjust the great imbalance between various aspects of urban construction are bound to come to nothing. In short, it will work against the implementation of the central secretariat's directive on the policy of capital construction in the capital. It is now time to make up our minds to exercise strict control over the scale of construction in the capital.

It is understood that with a view to solving this problem properly and gradually, the relevant departments of Beijing Municipality have conducted surveys and studies and have on many occasions put forward measures and proposals that should be adopted. But whether these measures and proposals can be implemented with success will depend on resolving three problems.

First, it is necessary to follow the correct ideological line, make a clean sweep of the influence of the ultraleft line and adopt an overall point of view. For a long time, under the ideological influence of "left" deviation the work of capital construction showed one great defect, that is, confining one's view to needs, disregarding possibilities, craving for greatness and success, and being overanxious for quick results; seeking high targets and high speed according to one's subjective will and disregarding objective conditions. It seemed that only those making such an approach were Marxist-Leninists and promoters of progress and that those who proposed realistic targets and speed were criticized as opportunists, right deviationists and promoters of "retrogression," and as one's lacking in revolutionary drive. It is this idea of making rash advances in the face of objective reality that has caused our people to endure untold sufferings. Further, some comrades always laid stress on the needs of their departments and units. "In your case, it is necessary to keep within the limit of resources; in ours, it is necessary to consider our needs." And so forth. In the final analysis, it is a matter of departmental selfishness--confining one's view to the part and overlooking the whole. They pay lip service to the "eight-character policy" of readjusting the national economy; actually, they oppose it. Without solving these ideological problems the policy of keeping within the limit of resources cannot be implemented.

Second, there should be comprehensive planning and capital construction departments that do have authority and respect science. There are comprehensive departments in charge of planning and capital construction both at the center and in localities. But why do they fail to guard the pass and bring their due part into play? While the reasons are many-sided, an important one is that some leading comrades do not approve requests or decide on projects according to capital construction procedures. Proceeding from their own needs, some construction units neither get together experts from the relevant sides to conduct exploration and study of possibilities, nor achieve overall balance through the comprehensive departments. While objectively they have not acquired conditions for capital construction, they send reports directly to their highest leading body responsible for the work. And some leaders often give more consideration to the needs of the side under their charge and less condition to objective possibilities. They simply draw a circle and make the final decision. Under such circumstances the comprehensive department finds it hard to bring up the matter even if they have objections. There are also comrades who see the impossibility but dare not offend others. They do not uphold principle, and they rush things through by drawing a circle and okaying proposals, contending to be nice to everybody. There are some leaders who are fond of having what they say be the final word, and they lose their temper and reprimand those who hold differing views. How can there be overall balance under such circumstances? How can there be planned, proportionate development? Things go to such an extent that the subordinates can neither stand up against decisions, nor accomplish their tasks, thus placing themselves in a passive position in their work. In April 1978, the State Council set up a leadership group for urban construction in the capital. Its main task is to exercise strict control over the urban development scale in the capital and to examine and revise comprehensive construction plans for the Beijing district. We hope this leadership group will be able to bring their role into full play and, on the principle of keeping within the limit of resources, examine and revise projects and achieve an overall balance. At the same time, we call upon the relevant sides to give this leadership group strong support in exercising their functions and power conferred by the State Council.

Third, it is necessary to pay close attention to the legislation relevant to urban construction and administration, to manifest socialist democracy and to strengthen mass supervision. Urban construction is an important part of national economic development. In strengthening economic legislation we should place the legislative work relevant to urban construction and administration in an important position and proceed with thorough investigation and research. At the same time, we must insure that "laws are abided by, strictly enforced, and violations are punished." We must uphold the dignity of law. Under mass supervision, things must be done strictly according to capital construction procedures and the relevant laws and decrees, and no one may approve requests and projects without authority. In the case of construction projects that have produced serious consequences as a result of violating state laws and provisions, the administrative and legal responsibility of those who originally submitted reports and gave approval should be investigated and affixed.

BRIEFS

ENTERPRISES EXPANDING CONTRACTS--Shanghai, 24 Nov (XINHUA)--A number of research units in applied science in Shanghai now have direct contacts with factories in many areas and trades since more enterprises manage their own financial affairs at present. The Shanghai Organic Flouride Research Institute has signed a number of contracts with factories making plastic products in Shanghai and Jiangsu and Zhejiang provinces. The institute provides new samples of flouride materials, processing technology and technical services. Both share the profits. The Shanghai Leather Industry Research Institute has given some factories run by neighbourhood communities and communes technical instructions for running a pilot workshop. The institute receives products in return for payment of production costs. One Shanghai electronic institute could not do intermediate experiments in making new products. A factory was put under its administration this year and now it can solve the problem. [Text] [OW241228 Beijing XINHUA in English 1209 GMT 24 Nov 80]

FOREIGN TRADE

BRIEFS

1981 FOREIGN TRADE FAIRS ANNOUNCED--Beijing, 7 Dec (XINHUA)--Chinese import and export corporations plan to sponsor 24 specialized export commodities mini-fairs in ten cities next year, a spokesman of the Ministry of Foreign Trade said today. Some fairs will feature textiles, from ctoon cloth to synthetics, woolens and silks, as well as ready-made garments. Others will have down products; fur-lined and leather garments, carpets, medicinal herbs and dried fruits and nuts. Others will feature stationery, sports goods, musical instruments, household electrical appliances, building materials and cloth shoes. Others will have chemicals and medicine. There have been 28 such mini-fairs so far this year, and the total volume of their business transactions was double that for similar fairs of 1979. BEIJING EXPERIENCING FEWER TRAFFIC ACCIDENTS

OW151220 Beijing XINHUA in English 1208 GMT 15 Dec 80

[Text] Beijing, 15 Dec (XINHUA)--The number of traffic accidents in Beijing has dropped this year, although traffic volume increased 10 to 20 percent, according to the traffic division of the Beijing Public Security Bureau today.

There were 9,436 accidents from January 1 to the end of November, 8.4 percent less than in the same period last year, and the number of deaths--460--showed a 12.2 percent decline.

November's figures were the highest for the whole 11 months, with 976 accidents involving 59 deaths and 720 people hurt, said Zhao Jiaying, head of the traffic division. He said 17 of those killed were peasants, visiting from the countryside, and school children represented 64.4 percent of the death toll, he said.

Zhao Jiaying complained that some drivers and cyclists do not obey regulations and are driving too fast, while some pedestrians, especially school children, do not have proper road sense.

Surprisingly, said Zhao Jiaying, the snow which fell in Beijing on December 10 caused only 22 traffic accidents the next day, with 11 injuries and one death, as against 30 accidents on a normal day. Zhao Jiaying explained that the security bureau sent out an extra 700 policemen to clear away the snow and spread cinders and sand and to control traffic on major roads and junctions. Drivers were also more cautious, he said.

Beijing now has 160,000 motor vehicles and 2.81 million bicycles.

The city has widened some major streets to improve traffic flow and introduced bicycle lanes on busy thoroughfares.

Beijing municipal authorities called two meetings recently, to discuss traffic management and called on 250 work units to stagger work-hours so as to relieve rush hour congestion. Now that winter has set in, all the city's 2,900 buses are packed at peak periods.

FAKING OF BRAND NAME GOODS CRITICIZED

OW071047 Beijing XINHUA Domestic Service in Chinese 0309 GMT 6 Dec 80

[Letter from XINHUA correspondent Shi Baohua: "The Evil Practice of Faking Brand Name Products Must Be Stopped"]

[Excerpts] Beijing, 6 Dec (XINHUA)--Recently, fake brand name products have been found, one after another, in the markets in some places. In Anyang Prefecture, Henan, 11 grassroots level supply and marketing cooperatives in six countries have sold fake Feige-brand bicycles. The fake products are of very poor quality. Some of the bicycles have no ball bearings for the revolving parts, but use wire washers instead. Some have no inner tubes, but fill tires with straw ropes. Many of the bicycles are basically unfit for use. It is known that the fake Feige-brand bicycles are made by some commune and brigade farm machinery plants or even individuals in Xingtai Prefecture, Hebei Province. Nearly 1,000 of these bicycles have been found in Anyang Prefecture, Henan, causing great losses to the masses.

It should be noted that the evil practice of making and selling fake goods is occuring in quite a number of places. According to the findings by concerned departments, at present no less than several dozen fake brand name products have already been found, such as Yongjiu-brand bicycles, Haiou-brand wristwatches, Three-Five-brand clocks [Mu Zhong 2606 6988] and many kinds of brand-name cigarettes, wines, drugs and articles of everyday use.

Concerned departments and the broad masses strongly call for resolute measures to halt the practice of seeking exorbitant profits by fraud or any means at the expense of the masses. To check this evil trend, it is imperative to strengthen socialist rule of law in the economic field. Industry and commerce administrative departments must strengthen market and trademark supervision. Enterprises and individuals that make and sell fake goods should be tracked down and disciplined and, in serious cases, punished according to law. It is necessary to quickly establish and perfect laws and systems for trademark administration and to strictly implement the system of trademark registration and the exclusive use of specific brand names by specific factories. Enterprises and individuals who illegally use trademarks must be seriously dealt with. Industrial enterprises must also strengthen management of packing materials and trademarks. Defective, discarded and outdated trademarks and packing materials must be promptly destroyed under supervision to prevent them from being stolen and sold or used without permission.

GENERAL

BRIEFS

SHANDONG SILK COMPANY--Shandong Province recently decided to reform the system on the management of concoons and silk production and marketing. Silk companies will be established in Yantai, Changwei, Linyi and Jining prefectures and Zibo Municipality. Silk administrative offices will be established in Huimin, Liaocheng, Heze, Dezhou and Taian prefectures. County silk companies will be established in 24 counties throughout the province. These silk companies and offices will open business in January 1981 and will engage in cocoon and silk production and marketing. FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Indexes to this report (by keyword, author, personal names, title and series) are available from Bell & Howell, Old Mansfield Road, Wooster, Ohio 44691.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

NATIONAL POLICY AND ISSUES

PROMISING FUTURE FOR INTEGRATED ENTERPRISES ENVISAGED

Beijing JINGJI GUANLI in Chinese No 11, 15 Nov 80 pp 29-32

[Article by Qiu Weigang [6726 4850 4854] of First Ministry of Machine Building: "A Beneficial Attempt--Competition as an Impetus to Integration as Viewed from the National Machinery and Power Products Trade Fair"]

[Text] The National Machinery and Power Products Trade Fair was held in Changsha from 10 to 30 August 1980.

The Trade Fair was guided by the principle of "bringing into play the strong points, protecting competition and promoting integration." It brought production and demand into direct contact with each other; reduced the intermediary links; enabled the consumers to select their purchases on a national scale; helped the enterprises develop their horizontal contacts in the form of direct contractual obligations; and legalized these contracts by incorporating them into state plans. More than 100,000 contracts were signed at the fair and the total volume of transactions reached 2.3 billion yuan. Seventy-four percent of these transactions were in the form of direct sales to consumer units, and 26 percent were sold to sales agencies. Of the contracts signed, 15 percent are binding in the current year while 85 percent concern obligations in 1981. Since the fair offered the choice of varieties. qualities, delivery dates, prices, technical services and so forth, the purchasing units were greatly impressed by its "simple procedures, convenience to consumers, and satisfactory solution of problems." For 3 years, the Jingba Sugar Refinery in Longchuan County of Dehong Prefecture in the frontier region of Yunnan Province had unsuccessfully tried to obtain a one-thousandth precision weighing scale produced in Shanghai. Now, the problem was solved within half an hour. The Light Industry Bureau of Tongling County, Anhui Province, ordered at the fair one "Liberation" car, several dozens of cameras and some refrigerators. Its representative said excitedly: "We welcome this trade fair, because the consumers can directly purchase what they choose."

Nationwide Competition in the Machinery and Power Trade

The trade fair smashed the old conventions of state monopoly for the purchase and marketing of private products and of unified distribution, and broke through the regional and departmental blockades. It has faithfully implemented the principle of buying the best choice and launched a nationwide competition in the machinery and power trade. Because of the fine quality of its goods, the First Machinery

Tool Plant of Shenyang sold 344 sets of CA6140 and C620 lathes within 3 hours on the first day of the fair, although many other plants producing the same products all over the country could sell only a few. Thus fine quality counts heavily in competition. Brand-name products of well-known plants won high prestige among the consumers, while goods of inferior quality could not be competitive and therefore were difficult to sell. The comrades from Anhui felt rather uncomfortable at the thought of the orders, totalling 5 million yuan in value, being placed by the Maanshan Iron and Steel Company, and the orders totalling 600,000 yuan being placed by the Provincial Electronic Bureau with other provinces. From this, they learned that unless their own products could really stand the test, they were in no position to compete with others. Some of their own products were not bad at all according to their own provincial or municipal standards; but compared with the national products, they could no longer be competitive. As some comrades from Sichuan said, sales of electric wires and electric cables at a trade fair held in Sichuan Province were quite brisk, and they felt that the quality of their products were not bad at all. "When there are no tigers in the mountain, monkeys call themselves kings," as the old saying goes. At the National Trade Fair, however, the "kings" have again become "monkeys," because of their very poor sales. Even though their products might be competitive, the plants and regions doing good business still could not afford to be complacent in view of the fierce competition. Shanghai had always been in the lead because of the fine quality of its goods and the large number of brand-name products. However, the quality of its bulldozers did not compare favorably with that of Xuanhua Engineering Machinery Plant. Even though Shanghai's price was 10,000 yuan lower, its sales were still poor. This experience gave the Shanghai comrades much food for thought and now they know that complacency and over-reliance on brand-name products would retard their progress. The comrades of Hangzhou Machine Tool Plant said that they were greatly moved at the sight of the comrades of other plants holding pamphlets in hand and trying hard to attract customers by shouting and sweating. This was a warning signal for them: If they did not continue their efforts to bring their products to perfection, they would also have a hard time selling their products.

Aside from the question of quality, competitions also arose over the question of varieties, prices, delivery dates, technical services, and so forth. The poor service of a certain plant in Liaoning had been the cause of complaints from many customers. This time, this plant sold only some 6,000 pieces, while some 600 million pieces of similar products from Shanghai were sold.

Competition provides good education for the producing enterprises by improving their business mentality. Many plant directors, machinery bureau chiefs, engineers, technicians and even workshop chiefs now join the clerks behind counters so that they could personally observe the importance of good services. Shanghai, Jiangsu and other provinces and municipalities are now deploying their forces in three different directions: to carry out transactions in the exhibition halls; to call on customers; and to conduct social investigations in the market. Deputy Director Yang of Nanjing Micro-electric Machinery Plant led his team to visit more than 70 customers in meetings or outside meetings, day and night, and thus strengthened their ties with the old customers besides getting 14 new ones. Some 1,500 sets of machines totalling more than 1.2 million yuan in value were sold. This sale was second only to that of the Shanghai Micro-Electric Machinery Plant. Many factory representatives pledged that after their return, they would build a sales force which should be technically competent and have good market experiences.

Competition has opened people's eyes and enterprises are now mindful of their competitors. Therefore, they feel the need to know more about their competitors, to collect more economic information and technical data on products, to learn from the advanced units, to discover the discrepancies and to work out the strategy suitable for the condiitons of competition.

Trade Fair, According to Its Nature, Is a Component of Unified Social Market

With the entry of capital goods into circulation as commodities, the unified socialist market handles not only consumer goods but also the means of production. From this trade fair, we can see that as a component of the unified socialist market, the machinery and power products market has the following features:

1. The nature of commodity. The trade fair is a good medium for exchanging commodities according to the law of value.

When supply and demand are brought face to face and the specifications of products are accurately met, the customer's requirements can be fully met and the relationship between supply and demand is one of eqaulity and mutual benefits on a voluntary basis.

Controlled price fluctuations are permitted.

The links of circulation and the circulation expenses are reduced, and the time of circulation is shortened. Therefore, good economic effects can be obtained in the process of circulation.

Circulation should guarantee the smooth progress of expanded reproduction and should be advantageous to production development. A close horizontal relationship between production and demand will provide such a guarantee. Gone are the days when there was on the one hand serious stagnation of goods and, on the other hand, difficulty to buy anything. The situation in the past would obstruct the progress of reproduction and seriously hamper the development of productive forces.

2. The nature of planning. The trade fair's function in planning is shown by the fact that transactions between supply and demand were carried out according to plans. As a matter of principle, the results of these transactions and the contracts signed were all included in the state plan. Furthermore, the transactions themselves were controlled and guided with due regard for some important requirements according to relevent principles and policies. Therefore, it can be said that the trade fair's activities were helpful in bringing about an overall balance in the national economy according to the laws of planned and proportionate development.

3. Variety. Machinery and power products are of many varieties with different technical characteristics and directions of operation. Therefore, the circulation of machinery and power products should take a variety of forms. In some cases, retail departments or commission agencies can be established; in other cases, trans-provincial/municipal integrated sales organizations can be formed; and in still other cases, the products can be consigned to material or commercial departments to be sold on a commission basis. Trade fairs are one of the many forms of circulation, and a very important one too. However, they should not function exclusively.

4. Unification. For a unified socialist market, there should not be any feudal separatist tendency as suggested by the regional or departmental blockades. The National Machinery and Power Products Trade Fair has begun to break through these blockades (though its impact on the departmental blockades is not so powerful). Thus the trade fair played a useful role in promoting the formation of a unified market for materials produced in the whole country.

Trade Fair Prompted the Reorganization of the Machinery Industry While Competition Promotes Integration

Through competition, the trade fair has prompted the reorganization and integration of the machinery industry. This is a good way of economic administration according to the objective economic laws and with economic methods. The trade fair helped many enterprises and departments in charge to give conscientious thoughts to their immediate economic benefits and then to the question of their survival and future development. As some comrades aptly put it: "In the past, readjustments were carried out by administrative orders which the enterprises were unwilling to accept. They even showed their resentment and voiced their complaints. Since they lost the competition in the trade fair and failed to do much business and are forced to carry out readjustments and with a firm resolve, they are now thoroughly convinced." Every enterprise has learned a real lesson in this trade fair, and because of the great importance attached to readjustment, very good sings have emerged:

First, readjustment of the orientation of service in the machinery industry. Many plants have taken advantage of their own strong points and are actively serving the light and textile industries in technical transformation, in serving agriculture, and in continually opening new markets. Nanjing Machine Tool Plant has designed the N-035 and N-036 special automatic lathes for a bicycle plant. These products were warmly welcomed. Before the trade fair opened, an order had already been placed for 80 sets of these lathes. At the trade fair, orders for another 150 sets were signed. Nanjing Machine Tool Plant has imporved a vertical cutter of Model CG1107. Later at the fair, an order for 200 such cutters was received.

Secondly, competition promotes integration. In the trade fair, there were frequent discussions on the question of integration among various enterprises. Some of them have already reached preliminary agreements, and others have planned to discuss further after the fair.

Integration for the sake of raising the level of complete sets of equipment. The supply of complete sets of machinery and power equipment is only consistent with the orientation of machinery industrial development. To be more competitive, the enterprises earnestly hoped to organize the supply of complete sets through their integration in order to satisfy the needs of the customers. Xian Power Machinery Manufacturing Company is now vigorously developing complete sets of power transmission and transformation equipment, but on two occasions in the past, this company had to purchase what it needed from outside. In the trade fair, its representatives conducted many discussions on this subject with the representatives of Changcheng Electric Appliance Company and Xuchang Electric Appliance Plant of Gansu, and the Kunming Electric Wire Plant in order to bring about closer cooperation in the production of complete sets of equipment.

Integration for the sake of expanding export. Exporting machinery and power products is an important strategic task. Mindong Electric Machinery Plant and Xiangtan Electric Machinery Plant have already begun discussions on integration.

Integration for the sake of making up products in short supply. Formerly, the usual way to make up for goods in short supply was to increase investment and equipment. Now the way is integration which will enable each member enterprise to bring into play its strong points for improving the products. Nanjing motor tricycle was one of the products in short supply. The Nanjing Municipal Machinery Bureau invited three plants to discuss the question of integration, and, as a result, they received at the trade fair an order for 3,000 motor tricycles.

Integration between coastal and remote areas and between old plants and those newly moved is taking place inland. Although the quality of products produced by factories in remote areas or the factories which have newly moved into the interior may be good, their business cannot be satisfactory because of their location. To improve their business by developing their strong points and avoiding their weaknesses, they held talks with the coastal area plants and old plants about forming joint undertakings. For example, the Third Machine Tool Plant of Xinjiang produced fairly good shapers, but had poor sales. On the other hand, Hundong Machinery Tool Plant of Shanghai had brisk sales of their shapers, but its productive capacity was limited. These two plants then began talks about a joint undertaking. The products of Yongan Electric Machinery Plant, which had newly moved from Shanghai to Guizhou, was quite good, but the sales were limited. At the time of the trade fair, Shanghai Electric Machinery Company approached this company too on forming some joint undertaking.

There were nine trans-provincial/municipal integrated sales organizations formed before the trade fair was held, and these organizations further developed their strong points in the fair. They established the system of unified acceptance of orders, and some of them arranged for income orders to be handled collectively and outgoing orders to be handled separately. This type of joint undertaking can better publicize their products, more effectively ascertain market demands, more efficiently serve their customers and offer better after-sale technical services.

The Trade Fair Has Posed New Tasks and Explored New Avenues For Economic Restructuring

As an important form of circulation, the trade fair naturally affected the systems of various quarters and pose many new tasks.

First, the trade fair smashed the old material control system and provided the orientation for a new system.

In the past, the system of material control called for state monopoly for the purchase and marketing of the products of private enterprises and unified distribution. Under this system, the enterprises of porduction need not be concerned with social demands and had only to produce by following the "plan" blindly, resulting in serious stockpiling. On the other hand, the consumer had to wait many years for something they needed, and then discovered that what they finally got was unfit for their use. This trade fair attracted some 180 types of heavy machinery and power products from all over the country into the market and brought supply and demand face to face so that people could freely choose what they wanted. The consumers were fully satisfied with the quality, varieties, specifications, delivery dates and prices of the products. A consumer in Yantai Municipality needed 9 kilometers of electric cable for delivery in September. Qingdao Electric Wire Plant guaranteed the delivery of the required quantity at the required date, and the consumer was fully satisfied. In the past, orders for 3 x 185 electric cable and 14 x 1.5 armored cable must be for a minimum of 200 meters. In the trade fair, some consumer wanted only 20 and 50 meters respectively, and the contract was signed.

In taking care of next year's requirements for key projects, the trade fair also achieved remarkable success in controlling and planning for some brand-name products, which are in short supply, so that part of them could be reserved for the key projects.

Some important questions were raised in practice. As a means of production, should machinery and power products be all allowed to enter the market? How will the requirements of state planning or the requirements of key projects be met? Practice has proved that after setting aside a certain amount for the key projects according to plan, all the rest can be sold in the market.

There are now two different views on reforming the system of material control:

First, classification of the products. The first part is under the category of unified distribution; the second part can be sold in the market after selective purchasing; and the third part can be totally sold in the market. This way of classification is likely to stifle market economy, because if one of the millions of types of capital goods--take rare metal for instance--comes under the category of unified distribution, the machinery industry enterprises using this type of metal will have to suffer, because in organizing production, they may be entirely helpless if they encounter the same difficulty as they did under the old system. Certainly, earmaking one type of machinery and power product (such as lathe) for unified distribution will also make it difficult for the units using these lathes. Second, classification of products according to different projects for which they are intended. After reserving the products for capital construction and major technical projects, all remaining means of production can be sold in the market. This was what happened in the trade fair and a good way to enliven economic work as well as a good orientation of restructuring the material control system.

Furthermore, the trade fair raised the problem of restructuring the planning system.

Based on consumer requirements, the machinery industry enterprises at the fair not only worked out plans to increase production for the current year, but also signed contracts for the next year as planned. State plans were also worked out for the next year as planned. State plans were also worked out for the next year on the basis of the contracts signed by the enterprises. Therefore, in the trade fair, the decision-making power of the enterprises in planning has actually been increased. At the same time, many new problems were brought to light concerning the restructuring of the planning system. For example:

1. Should state planning be classified as mandatory or serving the purpose of guidance? What are the differences between the two? How can plans to serve the purpose of guidance be worked out? How are the annual plans and the long-range plans reconciled?

2. Can the enterprises' plans be based on contracts and forecast? How will forecast be made?

3. How will the higher authorities assess the plans of the enterprises? What are the criteria for assessment? This and so forth.

The trade fair also provided new experiences and new information for restructuring the financial system.

In the trade fair, when contracts were to be signed, some production enterprises noted the financial difficulties of their prospective customers and accepted the terms of installment payments or payment after delivery. This created a new financial aspect.

The question of supporting industry in poor regions was brought into sharp relief at the trade fair. In addition to problems with poor management and insufficient publicity for their products, industry in poor regions also has real difficulties with transportation and other objective factors. How to support it financially has become an urgent problem for the departments concerned.

Finally, the trade fair provided new information and raised new questions on the restructuring of pricing.

Although the trade fair only permitted the downward fluctuation of prices to a certain extent, practice has proved that it helped promote competition among enterprises. Some enterprises even used "flexible prices," meaning the grant of quantity discounts, such as one price for the purchase of 5 sets and another price for the purchase of 10 sets. This will help stimulate the demand and increase sales.

Since the trade fair was a moving force in a nationwide competition, the prices of machinery and power products as reflected in the market will attract the attention of enterprises engaged in the same trade or producing related products. Thus the trade fair supplied a new source of information for an overall study of the price problem. How can prices be brought to a level approaching the amount of socially necessary labor actually spent? How to utilize the law of value then? Study of these problems will help adjust prices in a planned and orderly way and then solve the problem of restructuring the system of pricing.

At present, there is an urgent need to study the method of implementing the policy of good price for good quality in the market. In my opinion, market prices should be permitted to fluctuate to a certain extent.

After all, this is the first instance of a trade fair serving as a means to draw capital goods into the market. Despite its gratifying success already achieved, there are still many problems--particularly the problem of the form of circulation for the means of production--to be further studied in practice as well as in theory.

Also, precisely because this was the first instance, there will be repercussions and comments from many quarters. This should not occasion any surprise. The correct approach is to sum up experiences conscientiously and to continue the advance.

ECONOMIC PLANNING

RESPONSIBILITY FOR PROFITS, LOSSES DISCUSSED

Beiging JINGJI GUANLI in Chinese No 11, 15 Nov 80 pp 26-88

["Restructuring of Management" forum article by Huang Jinzhao [7806 0093 2507]: "Some Problems in Assuming Responsibility for Profits and Losses Among Collective Industrial Enterprises in Cities and Towns"]

[Text] To suit the development of productive forces in urban collective industry and to accelerate the growth of collective economy, unified responsibility for all profits and losses has been replaced by the individual responsibility of the urban collective industrial enterprises for their own profits and losses after some experiments. The new system has aroused the enthusiasm of the enterprises and the workers and staff members as shown by the remarkable economic results. As investigations have revealed, since 42 enterprises of the second light industry system in a certain city assumed responsibility for their own profits and losses, their profits have increased every month, and their profits for the first half of 1980 increased by 86 percent over those of the same period in 1979. To make this system an even greater success and to further promote the development of collective industry, the following problems should be studied and solved.

I. How to Organize Production According to Demand

Collective enterprises assuming sole responsibility for their own profits and losses enjoy relatively greater independence and more leeway. Except for certain products related to the national economy and the people's livelihood, which must be included in the unified state plan, these enterprises are free to determine the quantities and types of goods to be produced according to the market situation of supply and demand and according to their own capability. They can take advantage of the "maneuverability of a small boat" to enliven the collective economy and promote production. However, since some enterprises fail to study the situation of social production and know nothing about market demands, they are still continuing to produce at full blast what has already been overproduced. The main tendency now is toward:

(1) Blind production. Some enterprises are producing blindly and giving no thought to whether their products are saleable and whether the expected value can be realized. Some factories of a metal industry company in a certain city are producing cigarette lighters, padlocks, pliers and tools for carpentry and masonry. The commercial departments are already flooded with these goods and yet the factories are continuing to increase their production and adding to the stockpile. Since the

over-stocking is holding up a huge amount of funds, reproduction cannot be carried out. According to information received, the circulating funds used by these enterprises were increased from some 800,000 yuan by the end of 1979 to 1.57 million yuan by the end of April 1980--nearly a 100 percent increase.

(2) Reckless production of new goods. Some enterprises regard the goods in temporary short supply as being in permanent short supply and treat the present minor demands as major demands. They are producing whatever is in demand and do not care whether their products can eventually be sold. A certain factory discovered the shortage of electric irons in the market and jumped to the conclusion that this is the item in short supply. It concentrated its resources on this line of production, but by the time their products were ready for sale, electric irons had already poured into the market from outside and what had been in short supply for a while was now in excessive supply. The newly produced electric irons had to be sold at a high price but were poor in quality. Since they could not compete with the outside products, their production had to be discontinued. The enterprise then changed to the production of laundry machines. Through tremendous efforts, laundry machines were finally off the production line. Since there was then no big demand for laundry machines in the market, it had to change its line of production again. Because of the wrong choices and the frequent changes, the means of production and labor power were aimlessly shifted from one line to another resulting in a tremendous waste of materials and manpower with no ultimate products being turned out in quantity. The enterprise had to sustain losses for some time.

Duplicate factories and duplicate production. According to investigations, there is in a certain city an electroplating plant having a fairly high productive capacity but not always fully occupied. Some enterprises thought that electroplating was highly profitable and hastily went into this business. According to incomplete statistics, there are now more than 10 electroplating factories in the same city causing great waste and serious environmental pollution. Again, glass is in short supply and not easily available in the market. Many units in various localities are now straining their resources to produce glass. In a certain city, a glass factory is now unable to produce sufficient glass to meet the local demand. However, it will be able to do so in 1 year provided 1 million yuan is invested to increase its productive capacity. Now four different units are building glass factories from scratch, and according to their designed capacity, their combined output will be more than 20 times the city's annual requirement.

The products of collective industry are many and varied. Because of their complex nature, market regulation is in most cases necessary. Therefore, one of the problems to be studied and solved after the use of market regulation is with the way to guide enterprises in their market activities, to regulate the deployment of social labor among various sectors in a rational and proportionate way, and to supplement planned regulation with market regulation. We may consider the following measures:

1. Strengthening planning for guidance. In our country, planning is carried out for the purpose of guidance. To strengthen this type of planning, one of the important links is to form a national economic information center for the dissemination of information on the number of enterprises producing the same type of goods, their productive capacity, the trends of their development, social needs and the possible changes, so that the enterprises can keep abreast of the situation of

social production and demand and organize their production to meet the changes. At the same time, the local planning departments should adapt their work to current economic conditions, conscientiously study the new situation and carefully solve any problem that may crop up after the use of the market's regulative role. They will then be able to coordinate planned regulation with market regulation and promote social production.

2. The enterprises themselves should also surmount the old barriers of state monopoly for the purchase and marketing of private enterprises' products and adapt themselves to the new economic conditions which are subject to the regulative role of the market. They should be good at market forecast, go deep into the market for investigations, work out plans to develop production, organize production according to the demand, and bring up a new generation of products in a planned way. They should also be able to "take one step and watch out for another," or "doing one job physically and attending to another mentally" so as to avoid any rash action.

II. How to Handle the Problem of Collective Enterprises Being Approached by the Departments in Charge in Fund Raising

At present, some departments in charge of the second light industry system are collecting fees for the use of fixed assets and interests on the circulating capitals from the collective enterprises now assuming sole responsibility for their own profits and losses. Part of the funds thus raised are intended for some key projects for developing collective industry. According to a preliminary estimate by 42 enterprises of the second light industry system in a certain city, the amount of fees and interests handed over to the higher authorities amounted to one-third of the profits after paying the annual tax. Some departments in charge in the same system even raised the ratio of their own shares of the remaining profits after paying tax, and the portion which should be retained by the enterprises, had to go to the departments in charge.

We feel that collective enterprises assuming responsibility for their own profits and losses should take care of their own financial affairs. After paying tax, the remaining profits should be retained to be used for expanded reproduction. If any enterprise is short of funds, assistance can be obtained from banks in the form of loans. However, the method adopted by the departments in charge for raising funds as mentioned above is tantamount to that of equalitarianism and indiscriminate requisition. This is an infringement on the rights of collective ownership. The fixed assets and circulating capital of an enterprises are formed through a rather complex process, but they generally consist of three different portions: The first portion comes from accumulation by the enterprise itself; the second portion was partly or wholly derived from the departments in charge when the system of unified responsibility for all profits and losses was in force; and the third part was built up by the departments in charge with funds from state investments. The first two portions are owned by the majority of enterprises, because the fixed assets and circulating capital are basically built up through the enterprises' own accumulations. Even though a portion of them was supplied to the enterprises by the departments in charge when the system of unified responsibility for all profits and losses was in force, the enterprises had to hand over their profits to the departments both before and after the supply of this portion. Judging from the overall situation, we can see that the amount handed over to the higher authorities has always been more than the amount returned. Therefore, each case should be treated on its own merit. In other words, for enterprises whose fixed assets and circulating capital have come from their own accumulations, or from the departments in charge when the system of unified responsibility for all profits and losses was inforce, no more fees or interests should be collected. As for those whose fixed assets and circulating capitals have been obtained from state investments through the departments in charge, fees and interests can be collected at a reasonable rate. Moreover, if the departments in charge want to build up funds to be used on key projects, they can make use of loans. The departments in charge or the banks can open special accounts for this purpose and set reasonable interest rates. In this way, the surplus funds temporarily unused by some enterprises can be pooled to develop production.

III. How to Support Collective Enterprises Producing Minor Commodities

Since the change of unified responsibility to individual responsibility for profits and losses, some collective enterprises have been unwilling to produce minor commodities. When 231 enterprises of the second light industry system in a certain province had assumed responsibility for their own profits and losses, the production of more than 40 varieties of minor commodities was discontinued. The main reasons were as follows:

(1) Minor commodities generally bring little or no profit. When the prices of some raw and subsidiary materials are increased and the ex-factory prices of these minor commodities remain unchanged, the value of these commodities becomes higher than their prices and the enterprises have to suffer losses. According to investigations, 18 collective enterprises in a certain city have suffered losses on 24 different varieties of these minor commodities. These 24 varieties amounted to 15 percent of their total production in the first half of the current year.

(2) Prices for some minor commodities were originally set too low and have remained unchanged for many years. For some minor commodities, the price parity is irrational: The prices for large specifications, which can be easily processed, are set quite high while those for small specifications and for consumption in large quantities are set too low. In the case of nails, for example, the price for small specifications requiring complex processing and being consumed in large quantities, are low. The enterprises were unwilling to do this kind of business even under the system of unified responsibility for all profits and losses--whereby the losses incurred would be made good by the departments in charge. After the change to the system of individual responsibility for profits and losses, under which the enterprises had to take all the losses, they are even more unwilling to produce "lose-money" goods, and many of them are trying to change to other profitable lines of business. To my knowledge, there are 13 such varieties of minor commodities which amount to 8 percent of the total production of the same 18 enterprises in the first half of the current year.

(3) Taxation is repeated. Some minor commodities need coordinating parts from external sources. Yet no matter whether these parts are from internal or external sources, all products out of the specialized spare-part factory have to be taxed. They are to be taxed again later in ready-made goods. Thus the same spare part has to be taxed twice and this repeated taxation adds to the cost of production for minor commodities.

Minor commodities, though small, are closely related to people's livelihood. Therefore, active measures should be taken to support collective enterprises in developing the production of minor commodities. The following factors may be considered: (1) Some overall planning can be made for the enterprises to produce minor commodities along with some other profitable items. Thus in addition to offsetting possible losses, these enterprises can count on some profits. (2) Aside from the portion for local consumption, all products can be sold through direct factory-store contacts. For procurement, it is also possible to change second level centers to third level centers, and the commercial units should transfer part of the savings from the intermediary expenses to the industrial units. (3) No tax should be levied on the coordinating parts, except for those purchased by the commercial units from the spare-part producing plants. (4) The departments concerned should reasonably adjust commodity prices according to established price policy.

IV. How to Take Care of State, Enterprise and Individual Interests Simultaneously

Since assuming responsibility for profits and losses, some collective enterprises are anxious to retain more enterprise funds and obtain more bonus. Thus in dealing with the relationship between the state and the enterprise, some of them have appropriated the bonus funds before paying tax. Others with a poorly organized fixed production quota have practiced the piece-work system without setting any limit. As a result, the payroll became doubled with no appreciable rise of labor productivity. In dealing with the relationship between the enterprise and the individual, some enterprises, hoping to arouse the workers' enthusiasm with the grant of bonus, have set their own bonus rates and increased the amounts of cash awards.

We all know that given a fixed amount of profits after paying tax, any increase in the bonus fund will be accompanied by a corresponding reduction of funds required for expanded reproduction. Some enterprises have failed to correctly handle the relationship between state, enterprise and individual interests and one-sidedly stressed individual and enterprise interests at the expense of state interests. This practice must be corrected. However, the popular impression of collective enterprises at present is that the tax rate is too high and the nontaxable portion too small. Since they have to hand over too much to the state and their financial burden is too heavy, the enterprises are unable to add to their accumulations and to expand their production. This is specially true of some enterprises producing low-profit goods or selling them at cost. After paying tax to the state and handling over the administration fees to the departments in charge, they have not much left as a reward for their toil throughout the year. They are not only short of funds to renovate their equipment or to increase their productive capacity, but also unable to solve the problems of fringe benefits for their workers and staff members. This dampened the spirit of the workers and staff members and they have requested to be transferred to other enterprises which can make more profits. In accelerating the growth of collective industry, we must first treasure our wealth among the enterprises so that they can have more funds to increase their accumulations and to expand their production. Therefore, we should consider increasing the nontaxable portion and lowering the tax rate. Secondly, we should adopt more flexible policies. At present, no distinction is made among different enterprises in the payment of administration fees or in handing over to the departments in charge portions of remaining profits after paying tax, because there is only one standard for collecting such payments. Therefore, we should take the same attitude as shown to the poor production teams in the countryside so that those enterprises producing less profitable or nonprofitable goods should pay less or no administration fees, or be allowed to hand in less or no remaining profits after paying tax. These measures will help them renovate their equipment and expand their production.

BRIEFS

GUANGZHOU NATIONAL ADVERTISEMENT CONFERENCE--From 28 November to 5 December, the second national conference on advertisement work in some large and medium-sized cities was held in Guangzhou Municipality. The conference discussed how to strengthen the management of advertisement work. Attending were delegates of advertisement companies from 21 large and medium-size cities, including Beijing, Shanghai, Tianjin and Guangzhou, and people from Hong Kong and Macao advertisement circles. The conference discussed and adopted the draft regulations on the organization of the Chinese Advertisement Joint Company and the draft regulations of the Chinese Advertisement Association. The Chinese Advertisement Association will be set up in Shanghai and all places can set up branch associations if their conditions permit. [HK200600 Guangzhou Guangdong Provincial Service in Mandarin 1120 GMT 6 Dec 80 HK]

HUBEI TOURISM FORUM--The National Forum on Tourism was held in Wuhan for 1 week. (Hong Jiao), deputy director of State General Touriso spoke at the forum, saying that it was necessary to educate people on tourism in order to promote tourism and that all departments concerned should pay attention to and support tourism. Tourism not only helps to speed up friendly relations between other countries but helps to create remittances to balance expenditures and provide more opportunities for employment. Tourism has greatly developed after the smashing of the "gang of four." [Wuhan Hubei Provincial Service in Mandarin 1100 GMT 3 Dec 80 HK]

BEIJING TOURIST ECONOMY SOCIETY--Beijing, December 19 (XINHUA)--The Beijing Society for Tourist Economy, a popular organization set up to research tourism in China was inaugurated at a ceremony here today. The society's charter says its task is to carry out investigation and theoretical research into tourist economy in a spirit of "Letting a Hundred Schools of Thought Contend" so as to promote the development of tourism in the Chinese capital. With noted scholar Liao Mosha as its president, the society has an advisory committee and a 61-member council of tourist workers, economists, and well-known figures in the art and cultural fields. The society plans to publish a magazine. Speaking at a ceremony, Vice-Premier Chen Muhua said that as a comprehensive undertaking, the tourist industry should promote the development of the economy and culture. She urged that more tourist guides be trained and tourist services further improved. [Text] [OW191318 Beijing XINHUA in English 1242 GMT 19 Dec 80]

FINANCE AND BANKING

STIPULATIONS ON FOREIGN EXCHANGE INCOME PUBLISHED

OW290820 Beijing XINHUA in English 0734 GMT 29 Dec 80

[Text] Beijing, December 29 (XINHUA)--The Chinese government stipulates that all Chinese and foreign organizations and individuals in the People's Republic of China must sell their foreign exchange proceeds to the Bank of China. The stipulation is laid down in the "Provisional Regulations for Exchange Control of the People's Republic of China" promulgated by the State Council on December 18, 1980 and published today. However, this does not apply to the cases otherwise stipulated by law or decree or in these regulations.

Under the regulations, any foreign exchange required by Chinese and foreign organizations and individuals that sell their foreign exchange to the Bank of China is to be sold to them by the Bank of China in accordance with the quotas approved by the state or with relevant regulations.

The regulations stipulate that the circulation, use and mortgage of foreign currency in the People's Republic of China are prohibited. Unauthorized sales and purchases of foreign exchange and unlawfully seizing possession of foreign exchange in whatever ways and by whatever means are prohibited.

Foreign exchange remitted from foreign countries or from the Hong Kong and Macao regions to Chinese or foreign nationals or stateless persons residing in China must be sold to the Bank of China, except the portion retained as permitted by the state. Chinese and foreign nationals or stateless persons residing in China are permitted to keep in their own possession foreign exchange already in China. But if they wish to sell the foreign exchange, they must sell it to the Bank of China.

Foreign exchange remitted or brought into China from foreign countries or from Hong Kong and Macao regions by foreign nationals coming to China, by overseas Chinese and Hong Kong and Macao compatriots returning for a short stay, by foreign experts, technicians, staff members and workers engaged to work in domestic organizations, and by foreign students and trainees, may be kept in their own possession, or sold to or deposited with the Bank of China, or remitted or taken out of China.

The regulations stipulate that Chinese and foreign nationals and stateless persons residing in China may apply to the local branch offices of the State General

Administration of Exchange Control (SGAEC) for the purchase of foreign exchange to be remitted or taken out of China. When approved, the required foreign exchange will be sold to the applicants by the Bank of China.

When foreign experts, technicians, staff members and workers engaged to work in domestic organizations require foreign exchange to be remitted or taken out of China, the Bank of China will deal with their applications in accordance with the stipulations in the contracts or agreements.

Foreign exchange remitted or brought into China from foreign countries or from the Hong Kong and Macao regions by foreign diplomatic missions, consulates, official commercial offices, offices of international organizations and non-governmental bodies resident in China, diplomatic officials and consuls as well as members of the permanent staff of the above units, may be kept in their own possession, or sold to or deposited with the Bank of China, or remitted or taken out of China.

No restriction as to the amount is imposed on the carrying into China of foreign exchange, precious metals and objects made from them, but declaration to the customs is required at the place of entry.

To carry foreign exchange out of China or to carry out of China the foreign exchange previously brought in shall be permitted by the customs against certifiration by the Bank of China or against the original declaration form at the time of entry.

To carry out of China precious metals and objects made from them or to carry out of China precious metals and objects made from them previously brought in shall be permitted by the customs according to the specific circumstances as prescribed by government regulations or against the original declaration form at the time of entry.

Under the regulations, the carrying or sending out of China of Renmin bi checks, drafts, passbooks, deposit certificates and other Renmin bi instruments held by Chinese or foreign nationals or stateless persons residing in China, is not permitted, either in person or by others or by post.

INTERVIEW WITH BUREAU DIRECTOR ON EXCHANGE CONTROL REGULATION

OW311828 Beijing XINHUA Domestic Service in Chinese 1213 GMT 29 Dec 80

[Interview with Bu Ming, director of the State General Administration of Exchange Control, by XINHUA reporter--date and place not given]

[Text] Beijing, 29 Dec (XINHUA)--Bu Ming, director of the State General Administration of Exchange Control, talked with this XINHUA reporter concerning the "PRC's Provisional Regulations for Exchange Control" issued by the State Council.

He said: For a long time China has lacked an overall, systematic law for controlling exchanges and China's exchange control work has been relatively loose. But in recent years, because of China's developing national economy and increasing economic contacts with foreign countries, China has felt the need to strengthen its exchange control measures. The Provisional Regulations for Exchange Control currently issued by the State Council has met the needs of China's socialist modernization program and the requirements of its legal system. Centralized state control and management has always been a principle guiding China's exchange control policy. With centralized control over a limited exchange resource, the state can effectively keep expenditures within this limit and use it on endeavors that are most needed in developing the national economy, improving the people's livelihood and promoting social construction. Practice has proved the validity of this principle. A majority of nations--particularly developing nations--have exercised control over their foreign exchange. Since China is still backward in production and needs a great deal of foreign capital to acquire advanced foreign technology and equipment for its modernization program, it is even more important for China to control its foreign exchange well and use it wisely for a long time to come. Thus, the "regulation" stipulates that the principle of centralized state control and management of foreign exchange is commensurate with its legal system and is in the interest of the four modernizations.

Regarding exchange control over state organs and enterprises and other units, he said: China is a socialist nation, all unit revenues and expenditures in foreign exchange must be included in state planning in order to strengthen the state's control over foreign exchange, insure the fulfillment of state economic plans and achieve a balance in payments in foreign exchange. Foreign loans to any localities, organs or enterprises comprise a part of the state's total foreign debts and have a bearing on the balance of state exchange revenues and expenditures and on the state's international prestige as well. Besides, the international money market situation is very complex and unpredictable. A little carelessness can often result in losses. Therefore, the "regulation" stipulates that in accepting foreign loans, a domestic unit must first go through prescribed procedures for examination and approval.

Regarding exchange controls over state organs and enterprises and other units, the "regulation" also prescribes four restrictive clauses, namely, no private keeping of foreign exchange by state organs or units; no deposits of foreign exchange in foreign countries; no direct use of exchange revenues as payments for expenditure in foreign exchange; and no borrowing or transferring of exchanges from agencies set up by the state in foreign countries or from enterprises and other units set up by the state in foreign countries, Hong Kong and Macao. These measures are necessary in order that the state can dictate the use of foreign exchange. Of course, if a special case arises where foreign exchange is really needed, it can be obtained with approval.

Bu Ming said further: At present many people in industrial and commercial circles in foreign countries are very concerned about measures for exchange control concerning joint ventures established with both foreign and Chinese capital. This is only natural, and the "regulation" has provisions in this regard. To encourage foreign investments, relatively flexible measures have been adopted in dealing with exchange revenues and expenditures of these enterprises so long as these foreign exchange activities are legal, but they must be subject to the supervision and inspection of exchange control departments. If the foreign investors of these enterprises wish to send abroad the net profit they have earned after taxes, they can do so by following prescriptions in the exchange control regulation and making a request at the Bank of China.

[OW311830] Regarding the control over foreign exchange owned by individuals, Bu Ming said: Foreign exchange owned by individuals and kept inside China may be kept by the individuals as their personal possession. As for those Chinese now residing in China who had foreign exchange deposited in a foreign country, Hong Kong or Macao prior to the founding of the PRC, as well as for those returned overseas Chinese or compatriots from Hong Kong and Macao who had foreign exchange deposited in a foreign country, Hong Kong or Macao before their return to China, if they transfer their foreign exchange to China, they will be allowed to keep a greater portion of their transferred money in foreign exchange than previously permitted. Regarding foreign exchange remittances from abroad for individuals such as author's remunerations, monetary rewards, retirement payments and lecture fees, the recipient will be allowed to keep a certain portion of their remittance in foreign exchange. Specifics in this regard will be listed in the details for implementation.

Bu Ming added: The regulation will come into effect March 1981. There are still 2 months left to allow the various localities, departments and enterprises to make ample ideological and organizational preparations. At the same time, to facilitate the implementation of the "regulation," the State General Administration of Exchange Control will work out and publish the details for implementation prior to 1 March.

Bu Ming pointed out in conclusion: The circulation and use of foreign currencies in China will be strictly banned in order to maintain a unified Renmin bi market. No unauthorized agencies or individuals will be allowed to engage in trading of foreign currencies. No forms of unauthorized selling or buying of foreign exchange or evasion of foreign exchange settlements will be allowed. Any violation of the provisions of the "regulation" will be subject to punishment according to the seriousness of the offense.

HONG KONG PAPER ON PRC CURRENCY DEVALUATION

HK130303 Hong Kong HSIN WAN PAO in Chinese 12 Dec 80 p 2

["New Talk" column by Yang Chu: "Will the Renminbi Be Devalued"?]

[Text] Beginning 1 January, when domestic enterprises in China calculate prices in foreign currency they will use the exchange rate of 2.8 yuan to the U.S. dollar. Some people think that this means that the renminbi will be devalued, but that is a misunderstanding.

China's foreign exchange is handled in a unified way by the Bank of China. On the one hand, the Bank of China uses the exchange rate of around 1.5 yuan to the dollar in business transactions with foreign countries. On the other, domestic enterprises use a different rate when exchanging foreign currency with the Bank of China; that rate is determined by foreign currency supply and demand. There is no direct connection between the internal conversion rate and the official foreign currency exchange rate.

China's enterprises gain foreign exchange through the production and export of goods; at the same time they import foreign machinery and equipment for which they pay in foreign exchange. In the past the Bank of China mainly used price regulation in its overall handling of these transactions, so as to balance foreign exchange supply and demand. In order to encourage exports, the prices of products were fixed lower than their production costs, and the government provided subsidies to make up the deficit.

In the wake of the reform of China's economic system, more local enterprises have acquired decisionmaking powers in gaining, retaining and using foreign exchange, so it is still more urgent to apply a relatively uniform exchange rate to calculate prices for each enterprise or for each product, instead of calculating this according to the amount of foreign exchange.

To have the domestic conversion rate of the renminbi at one half of the international rate is of course aimed at encouraging the enterprises to increase exports and to go in for more careful calculation and strict budgeting regarding imports. In future the conversion into renminbi of the foreign exchange received in payment for each commodity will yield double the profit on domestic sale of that commodity.

Has this situation arisen because China has an unfavorable foreign trade balance, and should one draw from this the conclusion that the renminbi should be devalued? Not so, because apart from commodity exports, foreign exchange income also comes in various invisible forms such as tourism, remittances from overseas Chinese, services and so on. According to the report delivered by Vice Premier Yao Yilin at the NPC session in August, total foreign trade value in the first half of this year showed an increase of more than 20 percent compared with the same period of last year, while foreign exchange income from sources other than trade also rose relatively rapidly.

As far as the domestic purchasing power of the renminbi is concerned, there is no pressure at all for devaluation. Since the state finances are in the red, prices of some commodities have increased, and so there is inflation. The Chinese Government currently hopes to reduce expenditure by cutting down on capital construction and to vigorously keep prices down in order to overcome the inflation problem.

GOLD RESERVES OF $5-6 BILLION CLAIMED

Hong Kong TA KUNG PAO in Chinese 10 Nov 80 p 1

[Report: "Yao Yilin Tells Japanese Economic Reporters: China's Gold and Foreign Exchange Reserves Now Amount to U.S.$ 5-6 Billion; Says There Is No Need for Concern About Rumor on Possible Devaluation of People's Currency From Such a Figure. China Is Contemplating Formulation of Anti-monopoly Law, Rationalization of Enterprises, and Carrying Out of Worker Dismissal System"]

[Text] According to a dispatch of the KYODO NEWS AGENCY from Beijing dated the 7th, Vice Premier and concurrently Chairman of the State Planning Commission Yao Yilin received a delegation of economic reporters from the KYODO NEWS AGENCY at the Great Hall of the People in the evening of the 7th; during the conversation, he revealed:

1. China's gold and foreign exchange reserves currently amount to about U.S.$ 5-6 billion.

2. Along with the promotion of competition between enterprises, China is considering formulation of an anti-monopoly law.

When he discussed foreign exchange reserves, Yao Yilin said: "Recently our gold and foreign exchange reserves have amounted to U.S.$ 5-6 billion." He stressed that, in his opinion, as far as one could see from such foreign exchange reserves, concern about possible devaluation of the People's Currency was not called for.

The Chinese Government never publicly announced the figure of its foreign exchange reserves in the past. It was extraordinary, therefore, that Yao Yilin publicized a concrete figure this time.

On the other hand, Yao Yilin also indicated that, "along with China's effort to carry out reforms in the enterprises, improve enterprise efficiency, vitalize management, and promote competition, it naturally is inclined at present to protect competition between the enterprises; but when competition reaches a certain degree, there would be need to impose certain limitations on large-scale enterprises." China is considering the formulation of an anti-monopoly law; this indicates that China's policy is to allow a considerable amount of competition to take place between the enterprises. This is a point worthy of note.

Besides, Yao Yilin also said: during the present period of economic readjustment, enterprises with low efficiency would close down or become absorbed by other enterprises as offspring companies.

This is indicative of China's positive posture in developing the rationalization of the enterprises.

Concerning the workers, Yao Yilin said: "As for certain workers whose work results turn out to be rather bad, after the approval of the staff and workers congress at the given enterprise, they would be dismissed. This regulation was already carried out 2 years ago." This indicates that China has already begun to adopt the dismissal approach.

'TA KUNG PAO' REPORTS ON REFORMING BANKING SYSTEM, STATE MINISTRIES

HK200546 Hong Kong TA KUNG PAO in English 18 Dec 80 p 3

["Economic Reform: The Structural Base of Modernizations"]

[Excerpts] In the present stage of China's modernization, the emphasis is still very much on "readjustment, restructuring, consolidation and reform" as stated by Vice Premier Yao Yilin at the National People's Congress. In fact, it is now probable that the period of readjustment, originally planned to run through to the end of 1981, will last until 1983.

On the surface, this may appear somewhat disappointing, and indeed, it would be desirable from the viewpoint of foreign trade to maintain some of the projects which have had to be postponed or even sacrified.

On the other hand, to proceed full speed ahead would exacerbate existing difficulties in the economy and sabotage efforts at achieving fundamental reform. As Finance Minister Wang Bingqian pointed out, a great deal of damage had been done to the economy of China by Lin Biao and the gang of four. This damage was in part responsible for a budget deficit of RMB 17 billion last year. The need to phase out this deficit requires certain reductions in expenditure. Yao Yilin also pointed out that the percentage China is spending on accumulation is going down, a sign that the people's livelihood is being served by increased consumption. Furthermore, while heavy industry must continue to grow, more emphasis is being placed on light industry and agriculture, which had been neglected for a long time.

At the heart of the economic reform is the concept of decentralization. A number of industrial enterprises in each province have been allowed a considerable degree of autonomy. Previously, they received appropriations from the state to conduct their operations; any profits realized would revert to the state, while losses were made up by government subsidies. Under the new system, an individual enterprise is to be responsible for its own profits and losses. Profits are taxed at a reasonable rate, and the balance left to enterprise for reinvestment. On the other hand, losses must be absorbed by the unit itself. So far,the method appears to be enjoying a good deal of success where it has been put into effect.

Reform also means change in the banking system. Indeed, changes have already begun to take place. A few years ago, China had only one bank, the People's Bank of China. Even the Bank of China, which operates internationally, fell under its aegis. However, the Bank of China has been made an independent body, and the People's Bank has given birth to the People's Construction Bank of China and the Agricultural Bank of China. For the future, an export-import bank and an industrial and commercial bank are planned. When the structuring is completed, the People's Bank will have reduced its role to that of a central bank.

The part played by the other banks will also be different. Instead of acting as mere conduits for allocation of state funds, the bodies will become full-fledged lending institutions. This transformation from administrative unit to independent management unit will take place in the case of the People's Construction Bank in 1981. Already the bank has started setting up the machinery for feasibility studies of projects. Specialists and or departments will conduct the studies--and bear the responsibility for their evaluations.

All of these reforms bear the imprint of firm, decisive and imaginative State Council leadership under Premier Zhao Ziyang, and even the State Council itself is not exempt from reform. The current 38 ministries have become unwieldy. In order to remedy the situation, it has been proposed that some of the ministries be converted into commissions, which will be added to those which already exist as "super-ministries." The commissions will take on administrative functions, while below them the ministries will become enterprises engaging in economic tasks.

BANKING REFORMS INITIATED IN SICHUAN

Beijing GONGREN RIBAO in Chinese 18 Oct 80 p 1

[Report by correspondents Shi Shenhang [2457 4164 5300] and Tang Daiqing [0781 0108 3237]: "Sichuan Banking System Initiates Institutional Reforms at Selected Points for Experiment--Banks Are Changed From Public Institutions Into Entrepreneurial Institutions With the Right To Use and Adjust Deposits and Loans; Branch Banks Are Allowed To Draw Entrepreneurial Funds and Retain Portion of Profits; Situation of Eating From "the Common Pot" Is Changed, and Banking Work Is Rendered Flexible"]

[Text] In order to adapt to the needs of industrial, commercial and resource departments in carrying out economic and management institutional reforms, the Sichuan branch of the People's Bank of China has initiated institutional reforms at selected points for experiment throughout the provincial banking sysetm and achieved good results; banking work has been rendered flexible.

The management system of our current banking is a system relying mainly on the administrative approach and exercising its controls too rigidly; it no longer accords with the new situation of our four modernizations construction and the readjustment of our national economy.

At the selected points for experiment, the Sichuan Provincial People's Bank has expanded their autonomy in respect to the planning and management of credit loans, the issuing of medium-term and short-term equipment loans, etc. For instance, in the past, basic level banks in various facilities had no right to use the deposits they absorbed, nor the right to adjust the surpluses and deficiencies between various loan funds. This year, a change was made to institute the new approach of "uniform planning, management by the individual level, a link-up between deposits and loans, and control over the differentials," so that, under the premise of not exceeding the total differentials between deposits and loans approved by the bank at the superior level, banks in various localities may exercise the right of making use of the deposits received and thereby issue more loans if more deposits are absorbed; these banks therefore now enjoy the right to adjust various loan funds and are able to adjust their use flexibly according to their respective local needs.

In carrying out such institutional reforms at these selected points for experiment, the Sichuan Provincial People's Bank, in response to the ill practice of eating from "the common pot" in management in the past, also made a change to manage the banks by economic methods by turning them from public institutions into entrepreneurial institutions. After realizing the relevant targets of economic auditing, the basic-level banks can now draw entrepreneurial funds. At the same time, branch banks can also retain a portion of the profits earned according to the ratio approved by the head bank and use it on banking business construction, collective welfare and rewards for staff and workers at their respective levels, so as to connect management achievements closely to the economic interests of their staff and workers.

At these selected points for experiment in carrying out such institutional reforms, the Sichuan Provincial People's Bank has achieved eminent results. Banks at various levels now enjoy a definite extent of autonomy in management; their enthusiasm in organizing and making use of loan funds has been greatly improved in comparison to the past; accumulated funds have increased, and working funds are now subject to more flexible use. From January to August this year, deposits absorbed by banks throughout the province increased by 20 times over those of the corresponding period last year. This year, banks throughout the province have arranged altogether more than 300 million yuan of medium-term and short-term equipment loan funds to support the enterprises in the carrying out of 980 of their resource-tapping, renovation and transformation projects; among these projects, key support was supplied to 755 short-line ones such as light and textile industry and energy. Many projects supported by such loans have already achieved results in a short period. The Chengdu textile mill, while attempting to put out a new wool fabric with striped patterns, needed to transform its equipment; the bank issued a timely equipment loan of 220,000 yuan. After only slightly more than 1 month, the equipment was launched into production according to a schedule, and before long 190,000 meters of that wool fabric with striped patterns were produced and supplied to the market. The mill increased the value of its output by 420,000 yuan, and profit by 260,000 yuan, and thus speedily repaid the loan in its entirety.

REGULATIONS ON EXCHANGE CONTROL IN JOINT VENTURES

OW290710 Beijing XINHUA in English 0700 GMT 29 Dec 80 OW

[Text] Beijing, December 29 (XINHUA)--The Chinese government stipulates that all foreign exchange receipts of enterprises with overseas Chinese capital, enterprises with foreign capital and Chinese and foreign joint ventures, must be deposited with the Bank of China, and all their foreign exchange disbursements must be paid from their foreign exchange deposit accounts.

The stipulation is laid down in the "Provisional Regulations for Exchange Control of the People's Republic of China" promulgated by the State Council on December 18, 1980 and published today.

The provisional regulations say that, except where otherwise approved by the State General Administration of Exchange Control or its branch offices, Renmin bi should in all cases be used in the settlement of accounts between the above enterprises and other enterprises and individuals residing in the People's Republic of China.

Under the regulations, enterprises with overseas Chinese capital, enterprises with foreign capital and foreign partners in Chinese and foreign joint ventures may apply to the Bank of China for remitting abroad their net profits after tax as well as other legitimate earnings by debiting the foreign exchange deposit accounts of the enterprises concerned.

The regulations also stipulate that staff members and workers of foreign nationality and those from the Hong Kong and Macao regions employed by these enterprises may remit or take out of China an amount of foreign currency not exceeding 50 percent of their net wages and other legitimate earnings after paying taxes.

BRIEFS

ANHUI FINANCIAL REVENUE--Financial revenue has been gradually increased since September this year. Financial revenue reached 1.87 billion yuan in Anhui Province in the first 11 months of 1981, fulfilling 94.02 percent of the annual revenue, or an increase of 0.73 percent over the corresponding period of 1979. Anqing and Fuyang prefectures overfulfilled the 1980 financial revenue by 6.29 and 7.83 percent respectively about 1 month ahead of time. [Hefei Anhui Provincial Service in Mandarin 1100 GMT 10 Dec 80 OW]

RURAL SAVINGS DEPOSIT--Beijing, 13 Dec (XINHUA)--China's rural savings deposit has continued to increase this year. As of the end of November, the balance of rural savings deposit was 10.4 billion yuan, topping the same period last year by 4.1 billion yuan, averaging 12.8 yuan of deposit per person in the rural areas. Time deposit accounted for 70 percent of the total, up 10 percent from last year. [Beijing Xinhua Domestic Service in Chinese 1245 GMT 13 Dec 80 OW]

PRICE SOCIETY INAUGURATED--Beijing, 24 Dec (XINHUA)--The China Price Society was inaugurated in Beijing on 23 December. The guiding principle for the Price Society is: Organize and encourage members to actively study socialist price theories as well as Chinese and foreign commodity price systems, management systems and price structures so as to promote theoretical research of prices and the actual work of commodity prices in China and to accomplish the four socialist modernizations. The society elected Xue Muqiao as honorary president and Yu Guangyuan, Sun Yefang and Xu Dixin as advisers. Liu Zhuofu is the president and Li Cengxin and Peng Cheng are vice presidents. [Text] [OW251720 Beijing Xinhua Domestic Service in Chinese 1211 GMT 24 Dec 80]

HUBEI FINANCIAL REVENUE--Hubei Province has overfulfilled the year's financial revenue quotas 1 month ahead of time. By the end of November, the province had already fulfilled 101.67 percent of the year's plan, showing an increase of 11.34 percent over the same period last year. The province's industrial output has also increased. From January to November; the province's total production value increased by 18.9 percent over the same period last year. The amount of profits submitted to the state by the provincial state enterprises was increased by 13.9 percent over the same period last year. All areas throughout the province have worked hard to provide more opportunities for financial revenue. [Wuhan Hubei Provincial Service in Mandarin 1100 GMT 7 Dec 80 HK]

JIANGSU BANKING SOCIETY--The Jiangsu Provincial Banking Society has been established in Nanjing Municipality. Some 100 representatives attended the society's first meeting which was held in Nanjing from 6 to 10 December. This society will play an effective role in organizing as well as mobilizing all local banks in Jiangsu Province to better serve the needs of the four modernizations. [Nanjing Jiangsu Provincial Service in Mandarin 1100 GMT 10 Dec 80 OW]

SHAANXI FINANCIAL DISCIPLINE--The Shaanxi Provincial People's Government has demanded that all departments seriously study the State Council's circular on financial work in the last 2 months of the year, fully understand the importance of reducing deficits for stabilizing the national economy, and launch the masses to increase production and practice economy and boost output and revenue. Revenue departments must carry out a major inspection of tax collection. The Provincial Government will carry out no more expenditures this year except for disaster relief funds and other emergency spending. It is essential to observe financial and economic discipline. The following actions are forbidden: 1) Misappropriating state funds; 2) exceeding the stipulated jurisdiction in reducing or waiving tax; 3) boosting production costs and expenses; 4) arbitrarily increasing the scope of retaining profit; 5) misappropriating loans; 6) arbitrarily increasing business expenditure; 7) indiscriminately paying out bonuses and subsidies; 8) expanding the scope and level of expenditure; 9) failing to account for expenses; 10) spending money in bursts at the end of the year. [Xian Shaanxi Provincial Service in Mandarin 2300 GMT 8 Dec 80]

SHANDONG CONSUMER CREDIT--In Shandong, the Jinan Municipal Trust and Investment Company under the Chinese People's Bank recently began to grant loans to workers to buy Taishan brand television sets from Shandong Television Set Plant. Enterprises or organizations will apply for the loans for their workers. Anyone who wishes to buy television sets will have to pay only 30 percent of the price and then have the rest deducted from his wages in 20 yuan monthly installments. [SK151416 Jinan Shandong Provincial Service in Mandarin 2300 GMT 12 Dec 80 SK]

EXCHANGE CONTROL LAWS--Beijing, December 29 (XINHUA)--The Chinese government today published the "Provisional Regulations for Exchange Control of the People's Republic of China." The regulations, promulgated by the State Council on December 18, 1980, are formulated for the purpose of increasing China's national foreign exchange income so as to safeguard the rights and interests of the country. [Text] [OW290150 Beijing XINHUA in English 0138 GMT 29 Dec 80]

NOTARIAL ACCOUNTANTS' OFFICE--Shanghai, January 1 (XINHUA)—China's first Notarial Accountants' office was officially inaugurated in Shanghai today. The office undertakes to provide advice and guidance to Chinese enterprises and joint ventures set up by China and foreign countries by helping them analyze their economic activities and work out measures to reduce cost and increase accumulation. At the same time, it is authorized to serve as the notary public in economic affairs, while overseeing the declaration of dutiable goods and handling registration of trademarks and patents on behalf of the government departments concerned. Mandated by government departments of finance, enterprises and the people's courts, the office will also undertake to examine the accounts of parties involved in economic disputes to raise suggestions for arbitration. The office's 18 full-time and 12 part-time notarial accountants were appointed by the Shanghai Municipal Bureau of Finance, an organ directly under the municipal government. They work under a board of directors, of which 88-year-old Pan Xulun, a nationally-renowned expert of bookkeeping, is chairman. [Text] [Beijing XINHUA in English 1204 GMT 1 Jan 81 OW]

ANALYSIS, COMPOSITION OF CHINESE CRUDE OIL

Beijing SHIYOU XUEBAO [ACTA PETROLEI SINICA] in Chinese No 1 Jan 80 pp 92-105

[Article by Lu Wanzhen [7120 1238 3791] and Zhang Shouzeng [1728 1108 1073] of the Research Academy of Petrochemical Processing Science: "Characteristics of the Composition of Chinese Crude Oil"]

[Text] The numerous differences in the properties of petroleum from various parts of the world are mainly attributed to the differences existing in the structures and proportions of hydrocarbons, sulfur contents, nitrogen contents and metallic derivatives. Thus, the composition of petroleum is the most essential and most basic factor determining the properties of various petroleum fractions. This article summarizes the characteristics of the composition of Chinese petroleum, and it is hoped that it will serve as a useful reference for finding out about the oil refinery technologies and properties of oil products in our country. In order to give the reader a better idea of the results obtained through analyses, a brief description of the methods employed in analyses is presented, and several world crude oils are compared.

I. The Specific Gravities of Chinese Crude Oils and the Distribution of Various Direct-Distilled Fractions

Specific gravity is a relatively important property of crude oil, and is often used to indicate whether a particular petroleum is light or heavy. But different kinds of hydrocarbons have different specific gravities, and even if crude oils with different compositions have the same specific gravity, their direct-distilled fraction contents or real boiling point curves may differ greatly. Thus, besides specific gravity, the distribution of fractions in crude oil is another important property of petroleum. The distribution data of various direct-distilled fractions are often obtained by conducting the distillation in three separate stages with a distillation column which has approximately 15 theoretical trays and a reflux ratio of approximately 5:1. The first stage is known as normal pressure distillation (first cut--200 degrees Centigrade); the second stage consists of vacuum distillation at pressures below 10 mm Hg; the third is vacuum distillation below 2 mm Hg without the use of a feed tower. Throughout the entire process, the temperature inside the distillation still is not allowed to exceed 350 degrees Centigrade so as to prevent cracking.

Table 1 shows the specific gravities and percentages of various direct-distilled fractions in 21 Chinese crude oils. For comparison, the fractions are divided into 4 categories: gasoline, first cut--180 degrees Centigrade; diesel oil, 180-350 degrees Centigrade; vacuum distilled oils, 350-500 degrees Centigrade; residuum, >500 degrees Centigrade. From the data in the table, it can be seen that the specific gravities of Chinese crudes are over 0.86. According to the world oil guide published in the 1976-1978 issues of YOUQI ZAZHI [OIL AND GAS JOURNAL], 44 out of 102 exported crudes have specific gravities over 0.86. Thus, as far as specific gravity is concerned, Chinese crude oils tend to be heavy, but not the heaviest.

Due to their high contents of paraffin hydrocarbons [alkanes] and low contents of aromatic hydrocarbons, Chinese crudes are also characterized by relatively high contents of residuum and relatively low contents of gasoline as compared with foreign crudes of approximately the same specific gravity. At present, most of the crude oils in our country contain between 35 to 50 percent residuum, e.g. Daqing's crude oil contains approximately 40 percent residuum, Shengli's crude oil contains 45-50 percent residuum, crude oils produced in north China contain approximately 40 percent residuum, Dagang crude contains less than 28 percent residuum. The table also includes the specific gravities and direct-distilled fraction contents of crude oils from four different foreign countries; as Minas petroleum is also paraffin-base crude, it can be readily seen from the table that its composition is very similar to that of Chinese crude oil as far as gasoline and disel oil fractions are concerned. But due to its relatively small specific gravity, Minas crude has relatively low residuum content but slightly higher gasoline content. Although the specific gravities of Kuwait and Chinese crudes are very close, Kuwait's gasoline/diesel yield is more than 15 percent higher than Daqing's, and its residuum content is below 12 percent. The specific gravity of crude oil from California's Wilmington Oilfield (0.913) is 0.012 greater than that of Shengli's mixed-base crude (0.901), but its gasoline yield exceeds that of Shengli crude.

II. Composition of Gasoline

In recent years, the chromatographic method is commonly used in analyzing the composition of gasoline fractions in crude oils (1). Table 2 shows the hydrocarbon compositions of gasoline fractions distilled from chief Chinese crudes. From the data in Table 2, it can be seen that the direct-distilled gasoline fractions in the chief crudes are not only high in normal paraffins, most of them also contain more than 40 percent naphthenes [cycloparaffins] (with the exception of Yumen's direct-distilled gasoline which only has 29 percent). Table 3 shows the results of quantitative tests determining the monomer hydrocarbon composition of several kinds of direct-distilled gasoline fractions. From the results of monomer hydrocarbon analysis, it can be further seen that Chinese direct-distilled gasoline fractions not only contain relatively high contents of naphthenes, their cyclohexane/cyclopentane ratios are well over 1 (Table 4). It is conceivable that the cyclohexane content would become even greater as the gasoline's boiling point rises. Thus, it is easier to procure aromatic hydrocarbons when the gasoline is reformed. From the data in Table 3, it is obvious that besides the common types of paraffin hydrocarbons, naphthenes and aromatic hydrocarbons, Chinese gasolines also contain several kinds of dicycloalkanes, such as dicyclo [3,3,0] octane, transdicyclo [4,3,0] noname, etc. In recent years, such dicycloalkanes have also been found in foreign crude oils. As shown in the second row of Table 4, direct-distilled gasolines are high in isoalkanes (isoparaffins) with only one methyl radical branched chain, which also seems to be the universal pattern of monomer hydrocarbon distribution in gasolines. Thus, in computing the various proportions of naphthenes in Table 4 with the data provided in Table 3, whenever naphthenes and isoalkanes could not be differentiated in a given group, the results were totally calculated in terms of naphthenes on the assumption that there was only a minimal amount of multiple branched chain isoalkanes.

III. Composition of Kerosene and Diesel Oil Fractions

Generally, the mass spectography method is used in analyzing the composition of diesel oil fractions (4). Prior to mass spectrographic analysis, the oil sample is first subjected to column chromatography which separates the sample into aromatic hydrocarbons and saturated hydrocarbons, using silica gel as absorbent. Table 5 shows the results of mass spectrographic analyses of kerosene and diesel oil fractions in all kinds of crude oils; the normal paraffins were obtained through gas spectrography. Table 5 also shows the group compositions of diesel oil fractions in crude oils from Minas and California. By comparing the group compositions of Chinese and Californian diesel oil fractions (200-342 degrees Centigrade), it can be seen that the diesel oil fractions in Chinese crude oils are very high in paraffins, of which 23-41 percent are normal paraffins (slightly less normal paraffins in Daqing's diesel oil), but Chinese crudes contain relatively low contents of aromatics and naphthenes. The paraffin hydrocarbon contents in the diesel oil fractions of Chinese crudes are still relatively high even when compared against the diesel oil fractions of Minas crude (177-343 degrees Centigrade).

Table 6 compares the n-paraffin hydrocarbon contents in diesel oil fractions, crude gel points and crude wax contents. As indicated by the data in Table 6, due to the fact that crude oils from both Shaangan No 1 and South Xinjiang's Kalpin No 1 Key Well contain large quantities of light fractions. Nonetheless, they still contain extremely high contents of normal paraffins in spite of the relatively low gelation points and high wax contents (Shaangan No 1 crude oil contains nearly 30 percent normal paraffins; the crude oil from Kalpin No 1 Key Well contains more than 50 percent normal paraffins). Moreover, at temperatures below 300 degrees Centigrade, Shengli's diesel oil contains slightly less normal paraffins, whereas at the temperatures of 300-350 degrees Centigrade, its normal paraffins reaches as high as 36 percent.

In the course of diesel oil composition analyses, it was also discovered that north China's crude oils were very rich in pristane (2, 6, 6, 10, 14-tetramethyl pentadecane) and phytane (3, 7, 11, 15-tetramethylhexadecane), especially the latter. Table 7 shows the contents of these 2 kinds of saturated polyisoprenes in 250-300 degrees and 300-350 degrees Centigrade fractions of several kinds of crude oils. In Yaling crude oil, the contents of such compounds as phytane alone account for as much as 2.3 percent (of the crude); moreover, phytane accounts for nearly one-fifth of 300-350 degrees Centigrade fractions. Although the crude oil flowing in the Ren-Cang pipeline is not purely Renqiu crude, the latter actually accounts for a relatively large proportion. Based on the fact that the phytane content of the crude oil running through the Ren-Cang pipeline is as high as 1.8 percent, it is quite possible that Renqiu crude is also very high in phytane. From reference materials and reports, it is found that the pristane and phytane contents of crude oils from other parts of the world are equivalent to those of Daqing oil, i.e. roughly between 0.1-0.5 percent.

As Chinese crudes contain a lot of normal paraffins, they are also rich in monomer n-paraffins. For example, in Yanling crude, both C_{22} and C_{23} normal paraffins account for approximately 1.0 percent (of the crude); in Daqing crude, C_{17} and C_{18} normal paraffins account for roughly 1 percent of the crude. In Kalpin Key Well No 1 crude, both C_{12} and C_{13} normal paraffins account for approximately 3 percent. In Shaangan No 1 crude, the C_{19} n-paraffin content accounts for less than only 1 percent. Thus, one of the chief characteristics of our country's crudes lie in the relatively high percentages of such monomer hydrocarbons in the crudes.

IV. Composition of Vacuum Distillate Oils

Vacuum distillate oils can be used as cracking stock. Table 8 shows the properties and compositions of cracking stocks from various kinds of crude oils. The structural group compositions in Table 8 were obtained through refractive index--specific gravity--molecular weight computation. The wax contents came from solvent dewaxing, and contained small quantities of oil. For comparison against the results of foreign analyses, Table 9 provides the results of mass spectrographic analyses, and includes data on vacuum distillate oils from Minas and California. From the group composition data in Tables 8 and 9, it is evident that with the exception of Gudao crude, China's crude oils generally yield 350-500 degrees Centigrade fractions characterized by rich wax contents, low specific gravities, low sulfur contents, low aromatic hydrocarbon contents and rich contents of saturated hydrocarbons. Comparatively speaking, the corresponding fractions of Minas crude are quite close to the composition of Chinese crudes. Conversely, the composition of Californian crude is vastly different from the common types of Chinese crude oils, but it could be slightly closer to Gudao crude. At present, due to discrepancies in analytical methods, it is still difficult to come up with any definite comparisons.

V. Composition of Residuums

Due to their complicated composition, it is even more difficult to conduct composition analysis. Moreover, the contents of various residuum components are also linked to the depth of distillation. For a given crude oil, increases in distillation temperature and depth not only cut down saturated hydrocarbons in residuums, but also cause corresponding rises in resin and asphaltene contents. For comparison, Table 10 shows the results of analysis on the saturated hydrocarbons, aromatic hydrocarbons, resin and asphaltene contents of residuums above

500 degrees Centigrade which had been distilled from crude oils produced in major Chinese oilfields. In the course of analysis, emphasis was placed on making widest possible use of international common methods. For instance, in determining the asphaltene contents, analysis was based on the International Standardization Organization's (ISO) explanation: "wax-free components unsoluble in normal heptane but soluble in benzene" by adding normal heptane approximately 30 times the oil sample, and allowing the asphaltene to precipitate before determining the quantity of asphaltene. After separating the asphaltene components, the absorption chromatography method was used for analyzing saturated hydrocarbons, aromatic hydrocarbons and resins, using aluminum oxides containing 1 percent water as absorbent. The chromatographic column was kept warm by circulating water maintained at 50 degrees Centigrade, and the ratio between aluminum oxide and oil samples ranged from 40:1 to 100:1. First, petroleum ether was used to elute the saturated hydrocarbons; then, ethanol-benzene mixture was used to detach the resin. To compute the percentage of each fraction, it was necessary to remove the solutions by evaporation and drying the fractions.

From the data provided in Table 10, it can be seen that most of China's crude oils contain only very minimal amounts of asphaltene (normal heptane method). Gudao residuum is the only kind that contains 8 percent asphaltene; the other residuums contain less than 2 percent asphaltene. As compared with foreign residuums which approximate in resin content, Chinese residuums have very small asphaltene/resin ratios. The chief components of Chinese residuums are saturated hydrocarbons, aromatic hydrocarbons, and resin. In Daqing and Henan (Wenlin) residuums, the three components are almost equally distributed, each accounting for approximately one-third. Shengli and Renqiu residuums contain less saturated hydrocarbons than Daqing residuum, and Gudao residuum contains even less saturated hydrocarbons. Shengli, Renqiu and Gudao residuums are high in resin which account for nearly one-half. Shaangan No 1 residuum is characterized by the fact that it contains the most saturated hydrocarbons, but slightly less resin. Figure 1 is a schematic chart showing the contents of each component in various residuums.

In addition, based on the carbon content (C%), hydrogen content (H%) and carbon/hydrogen ratio, it appears that the residuums of China's major oilfields contain more hydrogen than foreign heavy residuums are low in C/H ratio and asphaltene. This characteristic may be conducive to indepth processing of Chinese crudes.

VI. Noncarbon and Nonhydrogen Contents in Chinese Crude Oils

Although carbon and hydrogen elements account for 95-99.5 percent of petroleum, and other elements such as sulfur, nitrogen, oxygen, and small quantities of phosphorus, arsenic, vanadium and nickel account for only 0.5-5 percent, the noncarbon and nonhydrogen elements all exist in petroleum in the form of hydrocarbon derivatives; thus compounds which carry such elements account for a much larger proportion. There is a relatively great difference between their properties and those of pure hydrocarbons, which greatly affects the nature and processing of petroleum. The noncarbon and nonhydrogen contents in petroleum have always been a problem of considerable interest to petroleum researchers.

Such classical wet-chemical methods as tubular furnace combustion for sulfur determination and the Kjeldahl method for nitrogen determination are chief means for determining noncarbon and nonhydrogen elements. But with the development of all sorts of processing technologies, there is need to come up with faster and more accurate ways of determining low-content noncarbon/hydrogen elements in oil products. There are quite a few circumstances under which the original wet-chemical methods become insufficient. At present, the microcoulomb method (for determining sulfur and nitrogen), atomic absorption or colorimetric method (for determining metallic contents) are more popular.

Table 11 shows the contents of noncarbon/hydrogen elements in Chinese crude oils, as well as the highest and lowest contents in crude oils from other parts of the world for comparison. From the data, it can be seen that most of the crude oils in our country are very low in sulfur--almost as low as crude oils with the lowest sulfur contents in the world. Even those Chinese crude oils which are relatively high in sulfur merely amount to two-fifths of the world's highest sulfur contents. According to reference materials (1), 20 out of 104 exportation crudes around the world have sulfur contents equal to or more than 2.0 percent. But Chinese crudes tend to be high in nitrogen. According to data on the nitrogen content of 210 crude samples (reference 7), there are only 31 crudes with nitrogen contents over 0.3 percent, which means that most of the crudes in our country contain more than 0.3 percent nitrogen.

Chinese crudes are all very low in vanadium, but slightly higher in nickel. As shown in Table 12, Chinese crudes have much higher nickel/vanadium ratios than foreign crudes, and nickel has greater influence than vanadium. Moreover, Daqing crude's arsenic content is approximately five times higher than Louisiana's (which probably contains the highest arsenic content in the world) which is quite rare.

VII. Characteristics of Chinese Crude Oils

Summing up the preceding data on various compositions, we find that most Chinese crude oils have the following characteristics:

1. Give relatively low yields of light oils but high yields of cracking feedstocks and residuums.

2. Rich in paraffins, especially normal paraffins, and therefore high in wax, low in aromatics, have high H/C ratios, and their gasoline fractions tend to be high in naphthenes.

3. Their residuums are low in asphaltene and have very low asphaltene resin ratios.

4. Low in sulfur but tend to be high in nitrogen.

5. Very low in vanadium, moderate in nickel, but high nickel/vanadium ratios.

Besides the preceding types of crudes, China also produces small quantities of crude oils with relatively unique properties and fall into the following two categories:

The first category consists of light crude oils, e.g. crudes from South Xinjiang's Kalpin Key Well No 1, Baxian, Shaangan No 1, Leng Hu [Cold Lake], and Henan (Wenliu).

The second category consists of crudes with low melting points, high specific gravities, and high in resin. For instance, Heishan and Karamay No 3 low melting point crudes, Dagang's Yangsanmu crude, and Shengli's Gudao crude are all suitable for producing low melting point products and bitumen. The curves in Figure 2 show the relations between the mid-boiling points and densities of the fractions distilled from the preceding crude oils. The relation between the mid-boiling points and melting points of the preceding crude fractions are shown in Figure 3, which also includes the relation curves of Daqing crudes' various fractions for comparison.

PRC ELECTRICAL ENGINEERS DISCUSS ENERGY SHORTAGE

OW241744 Beijing Xinhua Domestic Service in Chinese 1152 GMT 23 Dec 80

[Excerpts] Wuhan, 23 Dec (XINHUA)--Some Chinese electrical engineering specialists, scientists and technicians maintain that by actively adopting all kinds of measures to exploit, utilize and conserve energy, we can readily change the situation of energy shortages and make energy industry a leading sector in the national economy.

This view was presented at the Third Congress of the China Electrical Engineering Society, which was held in Wuhan Municipality 13-18 December. Representatives to the congress held that China thought the question of energy important and that encouraging results had been made in exploiting, utilizing and conserving energy. However, an increase in energy resources still lags far behind China's economic growth and the increasing needs of the people in their livelihood. Therefore, the question of energy should now be regarded as a question of policy. To accomplish the four modernizations, we cannot do without a sufficient supply of energy and a stable energy policy. Energy exploitation and conservation should always be emphasized in our energy strategy. Energy policy should be stable. Funds, technical forces and experimental bases for prospecting and designing should be strengthened so that the energy industry can truly become a leading sector.

Some specialists, scientists and technicians attending the meeting maintained that there was much room for energy conservation as far as thermal power equipment was concerned. First is the high rate of coal consumption. At present, China's thermal power installation capacity accounts for some 80 percent of the total plant capacity and more than 100 million dun of coal are being consumed annually. On an average, 457 grams of standard coal are consumed to generate 1 kwh of electricity. Second is China's small number of heat-supplying units. Existing ones are not fully utilized. Third is a lack of a design to bring out the overall superiority of generating sets. Main and the auxiliary machines are not properly matched. Big machines are used to perform the work of small machines, thereby resulting in the huge consumption of coal and electricity by powerplants.

The congress democratically elected the Third Council of China Electrical Engineering Society with Mao Henian as council chairman. The new council fervently hopes to strengthen cooperation with Taiwan Province's electrical engineering circles and has reserved two seats in the council for Taiwan counterparts.

ENERGY

BRIEFS

HEILONGJIANG COLLIERIES--All provincial collieries whose products are distributed under the unified state plan prefulfilled the annual plans for raw coal and dressed coal production and tunneling by 16 days, 51 days and 26 days, respectively. Hegang Coal Mining Administration produced some 15 million tons of coal in 1980. [Harbin Heilongjiang Provincial Service in Mandarin 1100 GMT 15 Dec 80 SK]

JILIN POWER PLANT--The Fengman Power Plant in Jilin Province had produced more than 1.4 billion kwh of electricity by the end of November, overfulfilling the annual production plan by over 40 percent. [Changchun Jilin Provincial Service in Mandarin 1100 GMT 9 Dec 80 SK]

JILIN RESIDUAL HEAT--Half of a heating system utilizing residual heat from the Changchun Power Plant, designed to provide hot water to an area of over 400,000 square meters, has been completed. Within a few days 65 units in (Tiebei) district of Changchun Municipality will enjoy hot running water. Some 135 boilers and over 100 chimneys in these units will be dismantled. After modifying two sets of turbogenerators in the Changchun Power Plant, Changchun Municipality can recover 217 billion btu's of residual heat a year, conserve 40,000 tons of coal, 16,000 tons of gasoline and 5 million yuan in heating costs. In addition, 800 boiler workers will be dismissed. Some 4.4 million tons of dust and 1,200 tons of sulphur dioxide in the air will be eliminated. The other half of the heating system will be completed next year. [SK111048 Changchun Jilin Provincial Service in Mandarin 2200 GMT 30 Nov 80]

JILIN COAL DEPOSITS--The Jilin Provincial Coalfield Geological Prospecting Company had overfulfilled its annual plan by 4 percent by the end of November and prefulfilled its plan by 49 days as of 12 November. The average black amber cutting rate was 83.5 percent, an increase of some 6.8 percent over the corresponding 1979 period. First and second grade coal products totaled some 89.9 percent. This company estimates that coal deposits in the (Luidaojiang) coalfield in Tonghua Municipality and the (Feilui) coalfield in Liaoyuan Municipality will be some 13.36 million tons. [SK152206 Changchun Milin Provincial Service in Mandarin 1100 GMT 13 Dec 80 SK]

LIAONING HEATING SYSTEM--In Shenyang Municipality, Liaoning, a 12 km long heating pipe was laid. The heating system uses hot water produced by the Shenyang Powerplant and supplies heat to enterprises and individual families. [Shenyang Liaoning Provincial Service in Mandarin 1100 GMT 14 Dec 80 SK]

HYDROELECTRIC COMMITTEE IN NANNING--The China Hydroelectric Engineering Association Committee for hydro electric power planning and dynamic power economics was set up in Nanning on 5 December. Some 100 professors and experts in hydroelectricity engineering attended the inaugural meeting. Zhou Guangchun, secretary of the Regional CCP Committee and vice chairman of the Regional People's Government, and Gan Ku, vice chairman of the Regional People's Government, greeted the professors and experts. The meeting conducted various discussions on different topics and received some 50 theses. In conclusion, the meeting announced the names of the members of the First Committee for Hydroelectric Power Planning and Dynamic Power Economics. [Nanning Guangxi Regional Service in Mandarin 1130 GMT 12 Dec 80 HK]

QINGHAI IMPROVES ELECTRICITY CONSERVATION--A responsible comrade of the Provincial Power Bureau has told our reporters that he is optimistic about the electricity supply for our province next year. He said: Judging by the consumption of electricity this year, the electricity supply next year will be able to meet the needs of industrial, agricultural and animal husbandry production in our province. He said: The supply of electricity this year has been better than ever. By 10 December, the Xining Power Network had generated and supplied 510 million kwh of electricity, overfulfilling the annual production plan. After analyzing this year's success, he said: The success can be attributed to the following factors: First, thanks to the readjustment of the national economy, the proportion of heavy industry has been reduced in our province. Second, units which consume electricity have been very cooperative. In the dry season this year, metallurgical and chemical industry departments overhauled their equipment in a planned way to improve the efficiency of the power network. Third, since the beginning of this year, all trades and professions in our province have stepped up work on the planned consumption and conservation of electricity and have scored initial achievements in this by the end of November, a total of 18.31 million kwh of electricity had been conserved in the province. [Excerpts] [SK221246 Xining Qianghai Provincial Service in Mandarin 2330 GMT 21 Dec 80]

SHANGHAI ENERGY FORUM--Shanghai, 4 Dec (XINHUA)--At a forum on energy conservation and development held by the Shanghai Municipal Scientific and Technical Association, participants discussed and offered opinions on utilizing the exhaust heat for power generation to help solve power shortage in cities, on speeding up development of coal gas and on readjusting the distribution of Shanghai's iron and steel industry. Some 40 proposals were raised at the forum including construction of a tidal power station at the estuary of the Changjiang River. Over 300 experts, professors and scientific and technological workers attended the forum. [OW050113 Beijing Xinhua Domestic Service in Chinese 0202 GMT 4 Dec 80 OW]

WUHAN GAS SUPPLY SEMINAR--In the middle of November, the National Construction Society held a seminar in Wuhan on urban gas supply and establishing an urban information network. Delegates from Wuhan Municipality said that it is necessary to bring into play the advantages of the municipal gas resources and to vigorously develop urban gas supply so that residents can use gas as fuel. They said that urban gas is one of the hallmarks of the modern cities and using gas is an important measure for saving energy resources and protecting the environment. At present, all large and middle-size cities in the country have done well in developing gas supplies. Seventy percent of Beijing residents and 45 percent of Shanghai residents use gas as fuel. [HK131458 Wuhan Hubei Provincial Service in Mandarin 1100 GMT 26 Nov 80 HK]

ZHEJIANG HIGH VOLTAGE LINE--Hangzhou, December 21 (XINHUA)--A new 220,000-volt transmission line was put into operation yesterday in Zhejiang Province. The new line stretches 180 kilometers from a power plant in Zhenhai County to Xiaoshan County to link up with the east China power grid. The line will greatly improve the power supply for the growing industry and agriculture in the eastern part of the province. Total investment in the project was about 20 million yuan. Construction took just 1 year. Zhejiang Province now has eleven 220,000-volt transmission lines. Construction of the 12th, which will run from Xiaoshan County to Jianbi in neighboring Jiangsu Province, is expected to start soon. [Text] [Beijing XINHUA in English 0753 GMT 21 Dec 80 OW]

BEIJING ELECTRICITY MEASURES--Beijing Dec 10 (AFP)--Electricity cuts are going to be made one day a week affecting most of the big factories in the Beijing area in turn to help alleviate a serious electricity shortage. The BEIJING DAILY today published a directive from the municipal authorities indicating that the electricity supply situation which is always bad in winter had worsened thanks to a long drought this year. Energy is one of the main bottlenecks affecting the Chinese economy. The energy sector will continue next year to develop very slowly, with a growth rate fixed at a mere 0.9 percent by Chinese planners. The government has also adopted a ruling on energy saving, laying down limits for energy consumption by factories. The Beijing authorities have decided to adopt six measures to boost the planned use of electricity in the municipality, the paper said. Besides the cuts in supply, it provides for the installation of electricity meters to keep track on units of electricity used and prevent enterprises with high consumption rates from exceeding the rations allocated them. In the event that the limits stipulated are exceeded, factories can be penalised by further cuts in current supplies. Big energy consumers will only be allowed to function during the latter part of the night. [Text] [OW100949 Hong Kong AFP in English 0940 GMT 10 Dec 80]

HUNAN HYDROELECTRIC STATION--Changsha, 4 Dec (XINHUA)--A new hydroelectric power station is now under construction in Hunan Province. With a designed capacity of 500,000 kilowatts, the Dongjiang project on the upper reaches of the Leishui River is part of the national effort to boost hydroelectric power production. The new power station is situated in eastern Hunan, on a tributary of the Xiangjiang which flows into the Changjiang through the Dongting Lake. Another big hydroelectric power station, with a generating capacity three times as big, is also being built in western Hunan Province on the Yuanjiang. The Dongjiang station will have four 125,000-kilowatt generating units. It will be protected by a dam, 157 meters high. The reservoir will be capable of holding 8,100 million cubic meters of water. [Text] [OW050607 Beijing XINHUA in English 1243 GMT 4 Dec 80 OW]

FRENCH OIL DRILLING CONTRACT--Tianjin, 13 Dec (XINHUA)--Drilling of the first ultra-deep prospecting well is now under full swing under a Sino-French contract in a 9,400 square kilometer area in the eastern part of the Bohai Sea. The contract on the prospecting and exploration of oil resources was signed on 29 May, between the Petroleum Corporation of the People's Republic of China and the national ELF Aquitaine Corporation of France. Drilling of the first prospecting well began on 27 November. [Text] [Beijing XINHUA in English 1259 GMT 13 Dec 80 OW]

SHANDONG SUSPENDS CONSTRUCTION OF 70 PROJECTS

Jinan DAZHONG RIBAO in Chinese 16 Nov 80 p 1

[Article by Yu Ji [5280 4949], Xi Cai [1585 2088], Zhao Guan [0340 4619], and Feng Yang [7364 7122]: "Shandong Suspends Construction of 70 Projects"]

[Text] Shandong has been thoroughly implementing the plan for readjusting the national economy on the capital construction front, and on the basis of the clearing up of capital construction projects underway last year, this year has curtailed or postponed 70 projects already under construction with individual investments of more than 1 million yuan. This represents a total reduction in investment of 570 million yuan, and is 21 percent of all uncompleted construction.

This year party committees and governments at the various levels have attached great importance to clearing up projects under construction and reducing the capital construction front. From the province level down to the prefecture and cities the organizational leadership has really been tightened up.

During the clearing up of projects under construction, the various localities and sectors adopted methods combining major and minor projects, with the stress on the former, keeping to the jurisdictional relationships and investment management limitations of each project. There is a lot of water conservancy construction in Shandong. There are more than 260 projects under construction which require investment of more than 100,000 yuan each. It will require an additional 1.3 billion in investment to complete these projects. Under these circumstances, we started off from the overall situation and gradually lined up all of the projects into categories, weighed the advantages and disadvantages, and decided to curtail or postpone 46 projects costing more than one million yuan each, reducing investment by more than 270 million yuan.

The Shandong Planning Committee, Construction Committee, Office for Clearing Up Projects Under Construction, and the Shandong Construction Bank met with the nine prefectures and municipalities and ten provincial departments and bureaus concerning the 473 projects under construction in Shandong costing more than one million yuan each. The projects were categorized and analyzed, and according to the policy that capital construction must be "properly paced" it was decided to curtail or postpone projects where such action was proper. The Dezhou Chemical Fertilizer Plant was to have produced 1,000 tons of synthetic ammonia per year, and was to have been constructed at a cost of 6 million yuan. However, because the capital could not be raised and there was no guarantee than the raw materials could be provided, it was decided to halt construction. The waste water treatment facility for the Jining Paper Mill could not meet national standards, so to protect the fishing industry of Lake Nansi, the water conservancy resources, as well as the physical and emotional well being of the 190,000 people in areas surrounding the lake, it was decided to halt construction even though construction had already begun. This has reduced investment by more than 36 million yuan. After 2 years of clearing up, Shandong has curtailed or postponed 241 projects under construction costing more than one million yuan each, which represents a 37.9 percent reduction. This has had a positive effect on controlling of the scope of construction and direction of investment, shortening construction time, and effectiveness of investment.

Although there has been some progress in the work of regulating capital construction in Shandong, due to lack of strict control of the scope of capital construction, projects with capital from different sources are going on at the same time, and in particular projects using private capital and loans are increasing rapidly. This means the capital construction front is still overextended. Recently, concerned departments of the province have requested the various prefectures and agencies to watch this closely and to take effective action. With the exception of the building for student recruitment at institutes of higher learning and workers' dormitories which are already prepared to begin construction, no new construction is to begin during 1980. Construction is to be speeded up on projects which are scheduled for completion this year so they may be finished up and turned over for use on time. Projects nearing completion must be completed before the end of the year so manpower, capital, and material may be concentrated on the projects to strengthen the weak links in the national economy, in order to get better economic results.

REDUCING SCOPE OF CAPITAL CONSTRUCTION URGED

Jinan DAZHONG RIBAO in Chinese 13 Nov 80 p 1

[Article by XINHUA commentator: "Reducing Scope of Capital Construction is Critical"]

[Text] The plan for readjusting the national economy has been carried out for more than 1 year, and we have done a lot of work in reducing the scope of capital construction. A number of projects have been curtailed or postponed. The capital construction front is still too long; there are still too many projects; and the scope is still too large.

This year, although that portion of the national budget directly allocated for capital construction investments has been reduced to less than 25 billion yuan, the various min-sectors and localities have another 29 billion yuan in variously-funded capital construction projects. These two total more than 50 billion yuan in capital, and when the various projects are actually carried out, they will end up costing even more.

Why is it hard to reduce the scope of capital construction? There are many reasons. One is the failure to completely cleanse the effects of leftist ideology. Another is that there many means of obtaining capital, and these are not tightly managed.

For a long time we have been in a hurry to complete socialist construction. We often start out from subjective dreams and pay no heed to objective possibilities. We make too great and unrealistic demands. We blindly pursue speed in economic development and high target figures in production. In capital construction we blindly pursue large scale projects. Many projects have been under construction for a long time and are still not completed. They just drag on as wars of attrition. Many of our cadre have been influenced by leftist thinking and believe that to give up on a capital construction project is something dishonorable. They would rather keep postponing it than give it up. It is because of this that it is hard to reduce the scope of capital construction.

As for capital itself, with the reform of the financial system and expansion of independence in enterprises, there has been a steady increase in the reserve funds of localities and enterprises, as well as in personal capital and bank loans. This is basically something good. The proper use of this capital could make it a major supplement to national finances, and it could help vitalize the economy. However in some localities these funds are not put to reasonable use and "four ups and four downs" situations have appeared. Namely, when investments from the state budget goes down, it is made up by extra-budgetary private capital from localities and departments. When capital construction projects are shut down, they are then started up again under the name of tapping potential or renovation. When funds are not allocated, bank loans are used instead. When domestic capital is all used up, then foreign capital is used to continue the construction. As a result, the scope of capital construction continues to expand in conflcit with the national plan.

In the implementation of the eight-character policy, readjustment is the key. If we are to readjust the national economy, we must first readjust capital construction, and if those projects which should be stopped are not stopped, then those projects which should be stopped are not stopped, then those projects which should be started such as energy, communications and transportation, urban development, and light industries and textiles will not be able to be started. Not only will we be unable to correct the imbalances in the national economy, but this will lead to greater imbalances in the future. This will of necessity affect the progress of the four modernizations. The Party Central Committee and the State Council attach much importance to this, and emphatically pointed out that under present circumstances we must resolutely reduce capital construction, as well as the scope of construction in general.

To reduce the scope of capital construction new projects must be strictly controlled. In 1979 there were still more than 1,000 large and medium scale projects nationwide. Although more than 100 projects have been stopped or postponed this year, the scope of capital construction has not been reduced. Therefore, if newly started projects, especially those new large scale projects are not strictly controlled, then the scope of capital construction cannot be reduced. In the future, all new projects should be subjected to serious feasibility studies, and all preliminary work should be done well. Furthermore, we must completely consider the financial and material possibilities over a period of several years. We must not start up new projects just because we have a little money right now, nor can we start a lot of new projects just because the financial situation has taken a slight turn for the better. When we arrange for imported projects we must consider our own ability to provide whatever is necessary to complete the project, and our ability to pay for it. Even in arranging for the urgently needed energy industries, we must be very cautious and make sure we have an overall balance. In light industries and textiles, we must not move too fast. We propose that the State Council and various communications and industries departments put tight restrictions on starting new projects, that they give full play to democracy and hold wide discussions and listen to the opinions of everyone.

One of the major purposes of reducing the scope of capital construction is to solve the problems of redundant construction and blind construction. For the past several years we have had a serious problem with redundant construction. In order to be a "complete system," some localities pay no attention to the overall requirements and do not consider developing contacts and cooperation between departments and localities. They stubbornly build coal mines, steel mills and chemical fertilizer plants in areas lacking resources. A number of areas which do have raw materials and resources do not consider the overall situation or their own level of technical expertise and build unnecessary automobile factories, tractor plants, textile mills, cigarette factories, distilleries, silk mills, bicycle factories, and other such processing industries, and are not willing to follow the state plan and allocate their raw materials to help the industrial cities with advanced technology. This has resulted in a situation where large factories don't have enough material while small factories duplicate their efforts. All this results in a lot of waste for the state. Therefore, in the process of readjusting capital construction, we must combine the readjustment with a restructuring of the system. That is, we must give play to economic laws. When necessary, administrative orders should be used to overcome the phenomenon of unnecessary and blind construction effectively, thereby guaranteeing that the work of readjusting the national economy will go smoothly.

To reduce the scope of capital construction, we must continue to concentrate on the work of clearing up those projects under construction, and must be determined to make further reduction of some of the old projects. Statistics show that this year there are still more than 1,000 large and medium scale projects under construction across the nation. As of 1981 it will require 100 billion yuan to complete these projects. At this year's investment level it will take 5 or 6 years to complete these projects even if no new projects are begun. In view of the nation's present financial capabilities this is a very heavy burden. Therefore we must make the decision to curtail or postpone some of these projects. We must resolutely curtail all projects under construction which are outside of the plan. We must also resolutely curtail or postpone projects under construction which are within the plan whenever warranted. Those projects which are not suitable to the level of the nation's finances and economy, which cannot become profitable within a short period of time, those for which the ancillary projects cannot be arranged for at the same time, those which will not provide a return on investment, those for which there is a shortage of resources, and those which would operate at a loss, should all be curtailed or postponed. In particular, some large scale projects which are within the plan should be specifically analyzed, and with an attitude of seeking truth from the facts, the decision to postpone or curtail such projects must be made when it is proper to do so. The large scale projects represent a large investment, and the curtailment or postponement of one of these is the equivalent of several hundred medium or small scale projects. Therefore, in reducing the scope of capital construction, we must think of ways to reduce those large scale projects, and we must be neither timid nor lenient.

BRIEFS

GUANGDONG CONSTRUCTION REDUCTION--The Guangdong Construction Bank has thoroughly examined projects under construction. In 1979, the bank suspended and postponed construction of 43 projects. This year, the bank has suspended and postponed construction of another [words indistinct]. In the past, the capital construction front in the province was over extended and the funds were not centralized, causing large-scale losses. DOMESTIC TRADE

PRC COMMERCE MINISTRY URGES COMMODITY PRICE INSPECTION

OW101250 Beijing Xinhua Domestic Service in Chinese 1321 GMT 9 Dec 80

[Text] Beijing, 9 Dec (XINHUA)--The Ministry of Commerce today issued a circular calling on commercial bureaus and departments of all provinces, municipalities and autonomous regions to conscientiously implement the State Council's "circular on strictly controlling prices and readjusting negotiated prices," to immediately organize forces to conduct inspections of commodity prices at both retail and wholesale stores under their jurisdiction and reduce prices that violate the regulations. While strictly controlling prices and readjusting negotiated prices, it is also necessary to strive to do a better job in commodity supply.

The circular stipulates:

All commodities, manufactured goods or farm produce, with prices fixed by the state (including imported television sets, radio-cassette recorders, calculators and wrist watches) must be sold at state-fixed prices and are not to be sold at higher prices at retail enterprises under commercial departments. The prices currently in effect that are higher than the state-fixed prices must be reduced immediately, and price reduction should not be delayed for any reason. The prices that are lower than the state-fixed prices may be maintained for the time being, but they should be reported to the responsible higher authorities for examination and solution.

Both retail and wholesale enterprises under commercial departments are not allowed to deal freely in manufactured goods or farm produce other than their own lines, except for those items authorized by the higher authorities.

Negotiated purchase and selling by the enterprises under commercial departments must be conducted in accordance with the principles laid down by the State Council and are limited only to the list of items approved by the provincial, municipal and regional people's governments. Negotiated purchase and selling of commodities not authorized for negotiation should be immediately stopped, and these commodities should be sold and purchased at normal prices. Today's negotiated prices should be seriously examined, with overhead expenses kept to the minimum and with price differences to be reduced. Higher prices must be lowered.

Trust companies and trade warehouses must put strict controls on the scope of their business. Agency fees and their own profits should be set at a low level, and speculation and profiteering should be strictly forbidden. They are not allowed to engage in negotiated purchase and selling of manufactured goods in a disguised form under the pretext of acting as purchasing or selling agents for industrial or foreign trade departments.

Industrial goods in the third category may be purchased or sold at prices negotiated by industrial and commercial enterprises. Within the limits of the list of items approved by the Provincial, Municipal and Regional People's Government, sales prices of these goods and their corresponding retail market prices may be negotiated by industrial and commercial departments, however, these prices should be normal prices.

Resin, sulphur and other means of production purchased and sold by commercial departments, including those in excess of production targets and those the producers are allowed to sell themselves, must be sold at state-controlled prices, and the negotiated purchase and selling of these commodities are not allowed. Plans for purchasing, selling and allocating these commodities should be well coordinated and seriously carried out.

Retail prices for vegetables should be stabilized, and the production and supply of vegetables should be well planned. The production of vegetables in great demand should not be decreased, their prices should not be raised, and the negotiated purchase and selling of these vegetables is not allowed. Seasonal price differences for eggs should be handled by all provinces, municipalities and autonomous regions themselves, and they should not put the supervisory right over prices in the hands of lower units.

'RENMIN RIBAO' ON PRIVATE TRADING, SPECULATION

HK241417 Beijing RENMIN RIBAO in Chinese 20 Dec 80 p 1

[Report: "ZHONGGUO NONGMIN BAO carries article by Wu Shizhong of the General Administration of Industry and Commerce on 'Whether Trading in Goods Carried From One Area to Another is Speculation'"]

[Text] On page five of the 30 November issue of ZHONGGUO NONGMIN BAO, there is an article in answer to a reader's "question on whether trading in goods carried from one area to another is allowed." The article, written by Wu Shizhong of the General Administration of Industry and Commerce, said: Due to the fact that at its present stage our country has a relatively low agricultural production level, a commodity economy that is not well developed and a relatively poor system of transportation, the practice of permitting a number of people to trade in goods carried between urban and rural areas helps in developing agricultural and sideline production, stimulates the circulation of commodities, satisfies the varied needs of the people in their everyday life and makes up for what is not supplied by state-run and cooperative commercial undertakings. But when referring to the need for trading in goods carried from one area to another, some comrades make the sweeping statement that "trading in goods carried between areas" is not speculation. This is not right. This question has caused confusion in many areas and must be clarified.

As far as the conditions of certain areas are concerned, trading in goods carried between urban and rural markets mainly has the characteristics of self-employment, the use of little capital, and personal involvement in the very physical act of buying, transporting and selling. It is an effort to earn a little extra cash made possible by price differences between areas or price differences attributable to seasonal factors. This practice is allowed. However, a number of people have done far beyond the scope of what an individual can physically do and make a business of procuring goods, which are hauled from one area to another with the use of public transportation, and even use hired labor. They resell the goods wholesale, reaping fat profits. This practice is not allowed. Therefore, it is wrong to make the sweeping statement that "trading in goods carried between areas is not speculation." Of course, at the same time, we cannot say that all trading in goods carried between areas is speculation.

To avoid a chaotic market and a switchover from farmwork to trading on the part of a large number of people in the countryside, trading by individual commune members must be guided by policies and must proceed in a well-led and restricted manner.

Trading must not go beyond an individual's physical power or involve hired labor. Trading must be limited so as not to interfere with the state's procurement of agricultural and sideline products. Trading must not hamper collective production or impair collective and public interests. Trading must be approved by the production team and cleared with the administrative department of industry and commerce.

Self-production-and-sale, trading-and-transportation, and transportation-and-sale are three different terms. The sale by communes and brigades and individual commune members of their own agricultural and sideline products means self-production-and-sale and not trading-and-transportation. Trading-and-transportation means buying goods in one area and transporting them for sale in another area. So-called transportation-and-sale means transporting one's own products for sale in another area. The three terms have different meanings and call for different policies. Self-production-and-sale and transportation-and-sale are protected. Trading-and-transportation is restricted. What goes beyond the given scope must be controlled.

PRC BUREAU ISSUES CIRCULAR ON PRICE CONTROL

OW090001 Beijing Xinhua Domestic Service in Chinese 1224 GMT 8 Dec 80

[Text] Beijing, 8 Dec (XINHUA)--The State Bureau of Commodity Prices today issued a circular calling on commodity price departments at all levels, under the leadership of the same level of the People's Government, and in coordination with departments concerned, to immediately organize cadres, workers and staff and the masses to conscientiously study the State Council's "circular on strictly controlling prices and readjusting negotiated prices" and to firmly implement the measures stipulated in the circular.

The circular says: The important task for commodity price departments at all levels in the meantime is to thoroughly implement the State Council's circular. Under the leadership of the People's Government and in coordination with departments concerned, they must organize strong contingents for commodity price inspection to conscientiously inspect and supervise prices. All problems that have been found during inspections must be seriously handled regardless of whether such problems are found in lower units or higher authorities. Regarding those who seriously violate laws and discipline, they particularly must be seriously handled. Those units and individuals who have done a good job in carrying out the price policy should be commended.

The circular of the State Bureau of Commodity Prices also points out: The "retail prices" mentioned in Article 1 of the State Council circular cover prices which have been approved by the state-operated commercial units, cooperatives and other concerned departments in accordance with the division of labor on controlling prices. They also cover listed prices which have been worked out according to pricing methods approved by the concerned commodity price departments. Any prices within this area which are higher than the listed prices must be lowered.

PRC FOOD MINISTRY ISSUES PRICE CONTROL CIRCULAR

OW111253 Beijing Xinhua Domestic Service in Chinese 1442 GMT 10 Dec 80

[Text] Beijing, 10 Dec (XINHUA)--The Ministry of Food today issued a circular calling on food departments at various levels to resolutely implement the State Council circular on control over commodity prices.

The Food Ministry circular stipulates:

Grain and edible oil with prices for state monopoly of marketing must be sold at state-fixed prices. The quality of grain and edible oil produced for planned supply must be maintained. Grain and edible oil that does not meet the quality standards should not be allowed to leave the factory (or granary).

Those end products of grain and edible oil that fail to meet state standards because of poor quality of raw materials and despite efforts made to improve quality may be sold at reduced prices temporarily in accordance with the principle of fixing prices on the basis of quality and with the approval of commodity price and food departments of provinces, municipalities and autonomous regions. Those who attempt to raise prices in a disguised way--by debasing quality--will be investigated, held responsible and strictly handled.

Negotiated purchase and selling of grain and edible oil can be conducted only after the state purchasing plans have been fulfilled. Negotiated purchasing prices should be maintained at the price level for grain and edible oil sold over and above quota, and prices for some products may surpass the prices for grain and edible oil sold over and above quota. Negotiated selling prices should be maintained at the prices of 7 December 1980. The prices may be lowered but not raised. Prices that are too high should be lowered adequately.

Food departments at all levels must, in coordination with industrial, commercial and administrative departments, strengthen supervision over country fairs. Production brigades are not allowed to sell grain, oil fats or oil crops at market before fulfilling state plans for purchasing grain and edible oil, and grain and edible oil belonging to collectives should be distributed to individuals for sale.

DOMESTIC TRADE

SUPPLY, MARKETING COOPERATIVES URGED TO CONTROL PRICES

OW101507 Beijing Xinhua Domestic Service in Chinese 1435 GMT 9 Dec 80

[Text] Beijing, 9 Dec (XINHUA)--The All-China Federation of Supply and Marketing Cooperatives today issued a circular calling on supply and marketing cooperatives at all levels to firmly implement the State Council's "circular on strictly controlling commodity prices and rectifying the negotiation of prices."

The federation's circular stipulates: Retail prices of industrial and agricultural commodities set by the state must be enforced. Prices higher than the list prices should be lowered immediately. Grassroots supply and marketing cooperatives and subordinate outlets (including rural agents) of supply and marketing cooperatives at all levels should not buy industrial products at retail prices. First-category and second-category industrial products bought from other localities and not included in a procurement plan must be sold at government list prices.

The circular reiterates that buying and selling at negotiated prices be limited to certain commodities and to a certain scope stipulated by the State Council and various provincial, municipal and autonomous regional people's governments. Negotiated selling prices must be lower than corresponding selling prices at local village fairs.

First-category and second-category industrial goods for daily use must not be bought or sold at negotiated prices. Trading warehouses may act as agents for buying and selling second-category industrial goods for daily use which the state permits industrial enterprises to sell themselves. However, they must be sold at government prices and the agent's commission must be kept at a minimum. Agricultural chemicals and chemical fertilizers, including those produced by factories in overfulfillment of their production plans, must be sold at the retail prices set by the state. They must not be sold at negotiated prices because they are subject to unified allotment by the state.

The circular provides that the purchasing prices of agricultural products must be strictly controlled and unauthorized price hiking is not permitted. The additional prices and subsidies for the amount purchased above the quota must be set according to State Council stipulations and must not be set higher than stipulated. The policy of state monopoly for the purchase and marketing of cotton must be persistently implemented. Before the completion of the state purchase plan, second-category agricultural and sideline products must not be sold at negotiated prices.

Communes and production brigades are not allowed to market second-category products themselves, nor are other departments allowed to deal in second-category products. The major producing areas of some important third-category agricultural and sideline products may be required to sell a portion of their products to insure necessary supply in urban markets. The business units of supply and marketing cooperatives must abide by the unified management regulations of a locality at which they buy. They should not offer unauthorized higher buying prices.

The circular calls for conscientious implementation of relevant regulations governing quality standards and price differences in buying or selling agricultural and sideline products of various grades. Unauthorized changes in grade or price of commodities are not permitted.

The circular demands the implementation of the principle of small profits but quick turnover by the catering trade, managed by the supply and marketing cooperatives. The cost of food which is bought raw at negotiated prices should be calculated according to regular prices of the same or similar raw materials. The amount in excess of the regular price and food tax may be added to the selling price. The gross profits on commodities at negotiated prices should be smaller than those of commodities at regular prices. They must be lowered if they are higher.

BRIEFS

ANHUI PRICE CONTROL--The Anhui Provincial People's Government held a provincewide telephone conference on price control on 8 December. (Hu Dan), director of the Provincial Financial Office, announced measures for implementing the State Council's circular on strictly controlling prices and readjusting negotiated prices. To stabilize commodity prices, measures must be taken to promote procurement of farm produce and raw materials; to insure sufficient supply of commodities during the coming new year and spring festival; to readjust negotiated purchase and selling of commodities; to insure that commodities with state-fixed prices are sold at the fixed prices; to prevent the malpractices of debasing quality or supplying commodities in short measure; to improve market management through coordination and cooperation among the departments concerned; and to immediately conduct a provincewide price inspection. Those units that violate the price policy will be fined and the wages of responsible persons withheld. In serious cases, disciplinary actions will be taken against those in charge and those involved. [Hefei Anhui Provincial Service in Mandarin 1100 GMT 9 Dec 80 OW]

ANHUI PRICE PROBLEMS-Hefei, 15 Dec (XINHUA)--A price inspection network combining both full-time personnel and voluntary workers has been established in Anhui Province since 12 December in order to solve price problems and protect the proper interests of producers, businessmen and consumers. The voluntary workers are selected from among the representatives of local mass organizations, local residents, cadres of government offices, enterprises and other units, and workers. The Anhui Provincial Price Committee decided that price inspectors have the right to criticize any unit or individual violating the price policy, and cooperate with the departments concerned in handling cases of price violation. [OW220045 Beijing Xinhua Domestic Service in Chinese 0749 GMT 15 Dec 80 OW]

PHARMACEUTICAL PRICES--The Ministry of Finance, the State Bureau of Commodity Prices and the State Pharmaceutical Administration recently issued a joint circular on the readjustment of the price of 268 chemical drugs throughout the country. According to the circular, the price of 156 drugs will be reduced and the price of 112 will be "appropriately raised." Most of the drugs for which prices will be reduced are drugs in common use. According to information released by competent departments, the price index of pharmaceuticals today has dropped by more than 80 percent compared with the early post-liberation period. [Beijing Domestic Service in Mandarin 1200 GMT 25 Dec 80 OW]

GANSU MARKET SURVEY--The Gansu Provincial People's Government dispatched a market survey team to investigate the market prices in the Lanzhou area. Ge Shiying, deputy secretary of the Provincial CCP Committee and deputy provincial governor, was appointed to head the team. The survey team started work on 16 December to supervise the various counties and districts in Lanzhou Municipality and the various bureaus concerned at provincial and municipal levels in implementing the State Council circular on stricting controlling commodity prices and consolidating negotiated prices. [SK171651 Lanzhou Gansu Provincial Service in Mandarin 1125 GMT 16 Dec 80 SK]

GUANGDONG PRICE CONTROLS--The Guangdong Provincial People's Government held an urgent meeting on 10 Dec on implementing the State Council's circular on price controls. The meeting demanded that all departments and units concerned work hard and do a good job of implementing price controls and market management. The meeting also demanded that people's governments at all levels strengthen management over price control work and that responsible comrades take the lead in carrying out inspections. In conclusion, the meeting demand that the departments concerned insure adequate supply of food and other commodities during the spring festival. [HK231153 Guangzhou Guangdong Provincial Service in Mandarin 2345 GMT 10 Dec 80 HK]

GUANGXI PRICE CONTROLS--The Guangxi Regional Government has seriously implemented the State Council's circular and strengthened price controls. The measures proposed are as follows: 1) The state's fixed retail prices must be maintained. 2) Commodities sold by local production teams must also comply with the state's fixed retail or wholesale prices. 3) Departments, and units other than commercial departments and collective commercial households, are not allowed to participate in business activities. 4) Commercial and industrial establishments must be registered. 5) All mistakes must be corrected in the course of industrial and commercial development. 6) The forestry departments must ensure timber supply and forbid indiscriminate lumbering. 7) People's governments at all levels must rapidly organize inspection of commodity prices. [Nanning Guangxi Regional Service in Mandarin 1130 GMT 12 Dec 80 HK]

HEILONGJIANG PRICE INSPECTION TEAM--A Heilongjiang Provincial commodity price inspection team headed by Chen Lei, secretary of the Provincial CCP Committee and governor, was formed on 13 December. The deputy team leaders are Hou Jie, standing committee member of the Provincial CCP Committee and deputy governor, and Li Qian, vice chairman of the standing committee of the Provincial People's Congress. Along with four sub-teams, this inspection team will inspect commodity prices in Harbin, Qiqihar, Mudanjiang and Jiamusi municipalities in late December. The main tasks of this inspection team is to help various localities formulate measures to stabilize market prices. [Harbin Heilongjiang Provincial Service in Mandarin 1100 GMT 13 Dec 80 SK]

HENAN PRICE CONTROL CIRCULAR--According to a HENAN RIBAO report, the Henan Provincial People's Government issued a circular on 11 December on price controls. The circular said: We must implement the State Councils' circular on price controls, and must do the following: 1) Rapidly organize the cadres and the masses to understand and seriously study the State Council's circular. 2) Act in light of local conditions to curb poor workstyles involving the raising of commodity prices. Taxation departments and banks must also exercise supervision over trades, and departments concerned must seriously strike out at all criminal and smuggling activities. 3) The Provincial People's Government will carry out a large-scale market inspection to stabilize market prices. 4) We must be strict on discipline and seriously punish people who raise prices on their own accord. [HK231155 Zhengzhou Henan Provincial Service in Mandarin 1100 GMT 12 Dec 80 HK]

HENAN PRICE CONTROL CONFERENCE--On the afternoon of 13 December, the Henan Provincial Commodity Price Inspection General Group held a conference for all its members. The conference decided that, in the light of the spirit of the relevant circulars of the State Council and the Provincial People's Government on strictly controlling commodity prices and readjusting negotiated prices, the province should make specific arrangements for conducting large-scale inspections of market commodity prices. Attending the conference were 140 cadres from all departments of the Provincial People's Congress Standing Committee, the Provincial CPPCC Committee and the Provincial Government and the mass organizations. (Xu Wenjian), Provincial CPPCC Committee vice chairman and deputy of the Provincial Commodity Price Inspection General Group, presided over the conference while Li Qingwei, Provincial CCP Committee secretary, vice provincial governor and head of the Provincial Commodity Price Inspection General Group, spoke. He said that it is necessary to do a good job of conducting this large-scale inspection of commodity prices and of stabilizing market commodity prices. As a part of this inspection, it is essential to determine whether or not the consumer goods prices and service charges are stable because these prices and charges have a bearing on the people's livelihood. It is also imperative to inspect whether or not commodity prices are indiscriminately raised or if price rises exist in a disguised form. [Zhengzhou Henan Provincial Service in Mandarin 1100 GMT 14 Dec 80 HK]

HENAN GOVERNMENT CIRCULAR--The Henan Provincial People's Government recently issued a circular on commodity prices, urging departments concerned to strengthen management over and stabilize prices of all sorts of commodities. In order to seriously implement the measures to stabilize the market and commodity prices, the Provincial People's Government stipulated that the price of grain and edible oil must not be changed, the price of meat and milk must not be raised, and prices of other products of daily necessity must be established. No unit is allowed to raise prices of daily necessity products or to sell at negotiated prices. It is necessary to stabilize price of vegetables and ensure adequate supply. The service trades are not allowed to charge people higher than the fixed price. [Zhenzhou Henan Provincial Service in Mandarin 1100 GMT 5 Dec 80 HK]

JIANGSU COMMODITY PRICE CIRCULAR--The Jiangsu Provincial Commercial Department, the Provincial Supply and Marketing Cooperative and the Provincial Commission on Commodity Prices issued a joint circular on 9 December calling for all prefectural, municipal and county commissions on commodity prices, commercial bureaus and supply and marketing cooperatives to prohibit the catering trade from raising prices of rice and other food. The circular also called on all leading cadres not to seek special privileges when ordering dishes in restaurants. [Nanjing Jiangsu Provincial Service in Mandarin 1100 GMT 12 Dec 80 OW]

JIANGSU PRICE INSPECTION--In order to insure the basic stability of commodity prices and maintain a stable life for the people, the Jiangsu Provincial People's Government on 16 December sent five commodity price inspection teams to all parts of the province to inspect prices of commodities closely related to people's livelihood, the market supply and demand, the stocks of commodities for consumption during New Year's Day and spring festival and the implementation of the State Council's circular on price control. [Nanjing Jiangsu Provincial Service in Mandarin 2300 GMT 16 Dec 80 OW]

JILIN URBAN, RURAL MARKETS--Jilin Province markets in both urban and rural areas have become more brisk. Compared with the corresponding 1979 period, in the first 10 months of 1980, the total volume of commodity purchases of the province increased by 17.7 percent, the total volume of manufactured goods purchases increased by 9.2 percent, the total volume of commodity sales increased by 11.9 percent and the total volume of television set sales increased by 200 percent. In rural areas, by the end of October the total volume of commodity sales increased by 10.8 percent and the volume of television set sales by 230 percent over the figures for the corresponding 1979 period. [Changchun Jilin Provincial Service in Mandarin 1100 GMT 6 Dec 80 SK]

LIAONING FINANCIAL DEPARTMENTS' CIRCULAR--The financial and trade department of the Liaoning Provincial CCP Committee and the financial and trade office of the Provincial People's Government issued a joint circular 20 December. It urged commercial departments at all levels throughout the province to eliminate such unhealthy trends as under-the-counter dealings, favoritism, shortchanging customers and disguised price hikes. The circular called on commercial departments to solicit people's opinions, and do a good job in supplying commodities and nonstaple foodstuffs during the new year period. [Shenyang Liaoning Provincial Service in Mandarin 1100 GMT 23 Dec 80 SK]

NANJING ILLICIT MARKET--An illicit free market in (Chenghong) Street of Nanjing City, Jiangsu, was closed on 15 December. When it was in operation, this free market not only created traffic jams on (Chenghong) Street but also disturbed social order of Nanjing City. After being investigated twice by administrative cadres of the Nanjing Municipal Industry and Commerce Administrative Bureau, a decision was finally made by the bureau to close down this illicit free market. [Nanjing Jiangsu Provincial Service in Mandarin 2300 GMT 15 Dec 80 OW]

SHANGHAI CONTRABAND TRANSACTIONS--The Party Committee of the Shanghai Navigation Bureau recently took severe action against several cadres from ships No. 701 and No. 203 who illegally bought large quantities of contraband items while delivering cargo to Fujian's Mawei port. The contraband goods include 350 black and white television sets, leather shoes, yard goods, color television sets, electronic calculators, and radio-cassette recorders. They intended to sell the merchandise in Shanghai for illegal profit. [OW180339 Shanghai City Service in Mandarin 2300 GMT 10 Dec 80 OW]

SHANGHAI PRICE INSPECTIONS--Shanghai, 12 Dec (XINHUA)--To insure thorough implementation of the state price policy and to put price inspections on a regular, systematic and legal basis, the Shanghai No. 1 Commerce Bureau recently drew up "rules for implementing policies on commodity prices" and issued them to its affiliated procurement and supply stations, stores and companies implementation. The "rules" stipulate that price policy must be upheld, price control must be implemented and so forth. [Beijing Xinhua Domestic Service in Chinese 1200 GMT 12 Dec 80 OW]

ZHEJIANG PRICE CONTROL--The Zhejiang Provincial CCP Committee and the Provincial People's Government held a meeting on the afternoon of 17 December to make arrangements for implementing price inspection work throughout the province. Chen Zuolin, secretary of the Provincial CCP Committee and vice governor of Zhejiang Province, spoke at the meeting. The Provincial CCP Committee and People's Government asked various concerned departments and offices to start price inspection work immediately and decided to form three inspection teams to supervise price inspection work in Hangzhou, Ningbo and Wenzhou municipalities in compliance with the decision of the State Council on price control. [Hangzhou Zhejiang Provincial Service in Mandarin 1100 GMT 17 Dec 80 OW]

ZHEJIANG SMUGGLERS--Industrial and commercial departments of various counties in Wenzhou Prefecture, Zhejiang Province, coordinated with public security organs to eliminate smuggling and speculating activities. Culprits in these activities have been arrested and punished, while 36,000 wrist watches, 1,320 television sets and radio-tape recorders, as well as a lot of silver coins and other smuggled items, have been seized. [Hangzhou Zhejiang Provincial Service in Mandarin 1100 GMT 6 Dec 80 OW] Since early this year, Zhejiang's Zhoushan Prefecture has made conspicuous achievements in combating smuggling and illegal sales of foreign goods. By 15 November, the prefecture had tracked down 607 cases of smuggling of wrist watches, gold, silver, tape recorders, calculators and foreign currency. [Hangzhou Zhejiang Provincial Service in Mandarin 1100 GMT 4 Dec 80 OW]

PRICE HIKES FIGHT--Beijing, December 9 (XINHUA)--A special mayoral group organized by the Beijing Municipal Government called on the public this week to help bring illegal and disguised price rises under control. Four deputy mayors were named to the special group which will oversee price supervision in Beijing's neighborhoods, in cooperation with local district representatives. They will follow guidelines set out in a circular issued by the State Council on Sunday. A similar circular calling for control of prices was issued in April by the State Council and the Communist Party Central Committee. Recently prices in the city have varied from the state-set norm because of unilateral rises made by some economic departments, the mayoral group said. Also, certain factories and businesses have given excessive bonuses or subsidies, creating an imbalance between purchasing power and available commodities, the group said. Detailed price regulations will be released by the committee soon. [Text] [OW091257 Beijing XINHUA in English 1246 GMT 9 Dec 80]

SUPPORT OF TEXTILE EXPORTS WITH IMPORTED RAW MATERIALS URGED

Beijing JINGJI GUANLI in Chinese No 11, 15 Nov 80 pp 33-34

[Article by Ding Hongmu [0002 7703 6206]: "Support Export with Import and Promote the Vigorous Development of Woolen Textile Industry"*]

[Text] Vigorous development of the woolen textile industry as an impetus to its modernization will not only improve the people's livelihood, but also increase accumulations more rapidly and expand our export as a source of foreign exchange urgently needed for national construction. However, an important problem confronting our woolen textile industry is the tight supply of raw materials. I would like to offer my personal views on this problem.

Woolen textile products are high class consumer goods. The raw materials for pure wool fabrics come from the natural fibers of animal hair, such as the hair of sheep, goat, camel, cow and rabbit and eider downs. Among them, wool from sheep is mainly used. Since the founding of the People's Republic, our woolen textile industry has undergone great developments. However, we have a large population and, for this reason, our production level is very low. The average quantity of woolen fabrics for the world population is 0.9 square meters, but ours is only 0.13 square meter, being only one-seventh of the world average. Based on a population of 960 millions as officially announced, and an annual per capita consumption of 0.4 meter, 384 million meters of woolen fabrics are required annually. (The minimum need for knitting wool is not yet counted.) If the annual yield of 10,000 spindles is 2.5 million meters according to the average standard, we will need 153.6 worsted spinning mills, each with a capacity for 10,000 spindles. Each mill will require 1,250 tons of carded and combed pure wool in addition to other downy materials. This is only an estimate of the amount of pure wool to be used as part of the materials for worsted spinning. The requirement for such a huge amount cannot be met by us in terms of either quality or quantity. If the requirement for exporting woolen fabrics is added to this figure, the supply of raw materials will be even tighter. At present, we have woolen textile mills with a total of 400,000 spindles, and yet they are every day worrying about the source of raw materials. The central departments concerned have also held many conferences advocating cooperation between industry and animal husbandry as a solution to the problem of raw material shortage.

---

* Comrade Ding Hongmo, former Director and concurrently Chief Engineer of Zinghe Woolen Textile Mill, Beijing, died recently. This article, written for this journal during his illness, is now published as a remembrance of him.

However, the mode of our grassland animal husbandry production is too backward to keep pace with the rapid development of the woolen textile industry. Let us take Urad Grassland in Nei Monggol for example. Here the mode of grassland production cannot be called bad; yet after 30 years' improvement, livestock breeding has to be at the mercy of nature. The cattle-raising period is long, the turnover is slow, and the commercial value is low. Since we are still "relying on heaven in raising cattle," the development of animal husbandry is largely influenced by weather and other natural elements. The productivity is unsteady, and should there be a serious natural disaster, a large number of cattle would die. I feel that until the backwardness of animal husbandry has been fundamentally changed, it would be impractical for us to modernize our woolen textile industry by mainly relying on the use of locally produced wool. My views are:

First, to develop the woolen textile industry, we should adopt the policy of "supporting export with import," that is, maximum import of raw materials and large-scale export of finished products. The present situation of competition in the world market of woolen textile materials is favorable to our large-scale import for the following reasons:

1. Import of wool by capitalist countries has been sharply dropping every year. In 1961, the total import of wool by these countries of the world was 1,437,000 tons. In 1975, the total import was only 1,013,000 tons. Among these capitalist countries, England imported 289,000 tons in 1961 and 132,000 tons in 1975; France imported 178,000 tons in 1961 and 126,000 tons in 1975; West Germany imported 100,000 tons in 1961 and 74,000 tons in 1975; and the United States, where the reduction was even sharper, imported 153,000 tons in 1961 and only 19,000 tons in 1975. This fully proves that for various reasons, the future of woolen textile industry in capitalist countries is not promising. It is true that they are using a lot of chemical fibers, but it is impossible for chemical fibers to catch up with the natural characteristics of wool in the near future.

2. The production of wool by the wool-producing countries of the world tends to increase. They do not increase their own woolen fabric production, and the capitalist countries are reducing their wool import. Then where is the wool market? I think China is one of the principal wool importing countries. Prices in the wool market can rise and fall; so our foreign trade personnel should master the technique of market forecast and at the same time be well informed on our domestic economic conditions in order that we can completely hold the initiative.

Secondly, to develop our own animal husbandry through self-reliance is certainly the main solution to the problem of raw materials for our woolen textile industry. However, we must fact facts squarely. Because of the ultra-leftist line pushed by the "gang of four" and the one-sided policy of "taking grain as the key link," animal husbandry became almost nonexistent. To fundamentally changed the backwardness of our animal husbandry, great efforts are required. At the same time, since our management of animal husbandry is so backward that people in the herding areas do not know much about the economic value of wool and downs, or the relationship between the development of wool production and our four modernizations, we must have a strong determination to develop our wool production and change the backward primitive methods of cattle-raising. We must accomplish the modernization of our animal husbandry and enable it to keep pace with the development of the woolen textile industry.

Thirdly, will importing wool be a bad investment? This is a very important economic question. According to some rough calculations, we need to spend 7,000 dollars to buy 1 ton of Australian wool and can use it to produce some 2,000 meters of wool fabrics to be sold to Sweden at the price of 6 dollars per meter, or 12,000 dollars for 2,000 meters. After deducting the cost for raw materials, we can make a clear profit of 5,000 dollars in foreign exchange. Neither the state nor the enterprise will have to lose money. When I visited Ziao Factory of Aili Company in Italy, I saw their warehouses full of Australian wool, Chinese cashmere wool, Chinese camel hair, Chinese rabbit hair, and also Chinese wool for woolen spinning. Yet they were making good profits. If Italy can do it, why can't we? Again, if we do not import worsted yarns, we can still import woolen yarns. However, since our technical equipment for wool-sorting is backward, we should have a number of modern sorting factories and a contingent of engineers, technicians and skilled workers with a good knowledge of wool processing. This unfortunately cannot be accomplished in 3 or 5 years.

After all, I advocate the policy of walking on two legs in dealing with the problem of raw materials for our woolen textile industry: First, there should be large-scale import of worsted yarns as well as some woolen yarns. Secondly, we should have the determination and energy to change the present backward state of our animal husbandry. Then we can modernize our woolen textile industry without losing the present good opportunity and further develop our national economy, improve our people's living conditions, earn more foreign exchange, and increase our socialist accumulations.

BRIEFS

FUZHOU INTERNATIONAL TRUST SERVICE--Fuzhou, November 13 (XINHUA)--The first local operated service organ for handling foreign business in Fujian Province--the Fuzhou International Trust Service Company--was formally established here yesterday. The company will buy and ship goods for foreign guests, overseas Chinese and compatriots from Hong Kong, Macao and Taiwan who come to Fuzou or to the nearby overseas Chinese villages. It will undertake business entrusted by overseas Chinese and foreign traders and buy various materials for overseas Chinese and Hong Kong and Macao compatriots to use in the construction of their home towns. It will also specialize in the handling of small shipments of industrial products that the foreign trade departments do not handle. [Text] [Beijing XINHUA in English 0723 GMT 13 Nov 80 OW]

GUANGDONG FOREIGN TRADE--In 1980, the people in Guangdong have overfulfilled the tasks of foreign trade 1 month ahead of schedule. By the end of November, the whole province had fulfilled 109.7 percent of purchase plans for foreign trade, an increase of 24.6 percent over the corresponding period of last year. This year, the leading departments of the party and government in the province have further strengthened their leadership over foreign trade and have worked to provide favorable conditions for the development of foreign trade. [Guangzhou Guangdong Provincial Service in Mandarin 1120 GMT 25 Dec 80 HK]

GUANGZHOU-HONG KONG SHIPPING--Cargo shipping between Zhuhai Municipality and Hong Kong officially began on 18 December. The cargo shipped from Hong Kong to Zhuhai include motor vehicles, motor bicycles, refrigerators and other electric appliances, while local products were shipped from Zhuhai. [HK290946 Guangzhou Guangdong Provincial Service in Mandarin 1120 GMT 25 Dec 80 HK]

JILIN EXPORT GOODS PURCHASES--Jilin Municipality prefulfilled the annual export plan. By the end of November the total purchases of export goods reached 106.31 million yuan, exceeding by 11.56 percent the annual plan, a record in the municipality's history. [Changchun Jilin Provincial Service in Mandarin 2200 GMT 10 Dec 80 SK]

GENERAL

BRIEFS

NEI MONGGOL COMMODITY PURCHASES--State-run commercial departments in Nei Monggol Autonomous Region had fulfilled their annual commodity purchasing and marketing plans. The total amounts of commodities purchased and marketed increased by 6.6 percent and 5.6 percent, respectively. By the end of November, the total amount of farm and sideline products purchased by the state-run commercial departments had increased by 7.5 percent over the corresponding 1979 period; the total amount of manufactured goods increased by 6.1 percent. According to incomplete statistics, the region's total amount of meat supplies in the first 11 months of 1980 increased by 24 percent over the corresponding 1979 period. Supplies of bicycles, wrist watches, sewing machines and silks and satins increased over 10 percent while supplies of televisions more than doubled. 'RENMIN RIBAO' ON 'PRODUCTION FIRST, LIVELIHOOD LATER'

HK091340 Beijing RENMIN RIBAO in Chinese 4 Dec 80 p 5

[Article by Wu Znenkun [0702 2182 0981]: "Commenting on 'Production First, Livelihood Later'"; passages within slantlines published in boldface]

[Text] The slogan "production first, livelihood later" was coined during the mass production campaign during the early 1960's. Under the difficult conditions at that time, this slogan played a positive role in inspiring the masses to carry forward the revolutionary spirit of surmounting all difficulties. In view of this historical fact, people did not criticize this slogan later on, even though it was not very scientific. Subsequently, this slogan was vigorously propagandized and applied everywhere as a basic lesson from experience and this became a major guiding principle in handling the relationship between production and livelihood.

Since the discussion on production aims last year, in order to sum up experience and lessons in economic work, some articles and speeches made analyses and comments on the slogan itself and the results brought about by the slogan. They held that the slogan should not be considered a principle of economic construction. Other comrades presented their strong disagreement to these comments. They believe that this slogan is an "objective law" and "correct principle" which their respective departments must follow in carrying out economic work. Thus, a more thorough discussion of this problem is necessary.

/I. "Production First, Livelihood Later" Is Incompatible With the Marxist Principle on the Relationship Between Production and Consumption/

Comrades who advocate "production first, livelihood later" believe that this slogan totally conforms with Marx' propositions on the relationship between production and consumption as stated in the "Preface to 'A Contribution to the Critique of Political Economy.'" I believe that a comprehensive--and not one-sided--understanding of Marx' propositions will provide no theoretical basis for "production first, livelihood later."

In the "Preface," Marx discussed from three basic points the relationship of unity of opposites between production and consumption and the principle that production occupies the dominant position in this relationship.

First, a relationship of direct unity exists between production and consumption. Production is also direct consumption, while consumption is also direct production. The proposition that production is also direct consumption pertains to the fact that the process of production of material goods is also a process of consumption of labor force and a means of production. This is called productive consumption. The proposition that consumption is also direct production pertains to the fact that the process of individual consumption of a means of livelihood is also the process of reproduction of labor power. This is called consumptive production. These propositions of Marx show that production and consumption are directly integrated with each other. There is no priority relationship between them.

Second, production and consumption are a medium to each other and they symbiotically coexist. Production is a medium of consumption, meaning production provides consumption with objects of consumption and makes consumption possible. Consumption is also a medium of production, meaning consumption provides the products of the production process with consumers (the main body of consumers) and brings about the final consummation of the products. This analysis of Marx further shows that an ordinal relationship does not exist between production and consumption. Instead, what exists between them is a relationship of dialectical unity wherein one is a precondition for the other and both symbiotically coexist. As Marx stressed: "There can be no consumption without production, while there can also be no production without consumption."

Furthermore, production and consumption create each other. Consumption creates production in two respects: First, it is only in consumption that the results of production become real products; second, consumption creates a new starting point for further production. On the other hand, production creates consumption in three ways: First, production provides the objects of consumption; second, production creates the forms of consumption; and third, production is the motive force for consumption. These formulations of Marx again demonstrate that there is no ordinal relationship between production and consumption.

Thus we can see that from Marx' above discussion, no theoretical basis for "production first, livelihood later" could be found. Some comrades might ask: Did Marx not say that "production is the actual starting point and it is an important factor that occupies a predominant position"? Does this not mean "production first, livelihood later"? Based on this statement of Marx, they further explained that: "As Marx pointed out, if we grasp production as the starting point between the two important factors production and consumption and make it the predominant factor, this will also activate the improvement of the masses' livelihood and constantly bring the whole process to a new and higher level." However, we have been practicing "production first, livelihood later" for many years, yet it has not "activated" corresponding improvements in the masses' livelihood.

Then, does the statement that "production is the actual starting point and it is an important factor that occupies a predominant position" actually mean "production first, livelihood later"? The answer can only be negative. What is meant by production as the starting point here is in the context of the reproduction cycle consisting of four links, namely production, distribution, exchange and consumption. (Even the order listed in this cycle is only a chronological order in the production process and does not denote the priority of people's work.) However, social production is also a recurring cycle of the reproduction process. From the point of view of the recurring reproduction process, none of the links is an absolute starting point or ending point. They come in a cyclical sequence. Marx also said: "Consumption itself, as a need and a demand, is an important integral factor in production activities." Therefore, granting that production should come first, the consumption of the workers itself is an important integral factor in this "first" because without the reproduction of labor power, production could not proceed. Thus, we can say that production can never be first independently and in isolation.

In short, after thoroughly reading Marx' complete formulation on the relationship between production and consumption in the "Preface," the validity of "production first, livelihood later" could not be proven. On the contrary, the one-sidedness of this slogan becomes evident.

/II. "Production First, Livelihood Later" Should Not Be Confused With the Principle of Gradually Improving the People's Livelihood on the Basis of Developing Production/

Comrades who advocate "production first, livelihood later" repeatedly explained that this slogan was formulated according to the party's principle of "gradually improving the people's livelihood on the basis of developing production" and is a concrete realization of that principle. From their point of view, negating "production first, livelihood later" is tantamount to negating the principle of gradually improving the people's livelihood on the basis of developing production. In reality, "production first, livelihood later" is not synonymous to the principle of gradually improving the people's livelihood on the basis of developing production.

"Gradually improve the people's livelihood on the basis of developing production" is our party's correct principle in handling the relationship between production and livelihood. This principle mainly means three things: First, developing production is the material basis for improving the people's livelihood. Without this material basis, one cannot talk of improving the people's livelihood. Second, the people's livelihood can only be improved with the development of production. The degree of improvement must not exceed that allowed by the development of production. We should not distribute and consume everything that has been produced. Third, development of production is only a means. The improvement of people's livelihood is the end. Development of production must serve this end. Otherwise, it becomes meaningless. Thus we can see that the principle closely combined the development of production and the improvement of livelihood. It reflects the relationship of dialectical unity between production and livelihood and between production means and production aims.

In handling the relationship between developing production and improving livelihood, our party has always taken an overall view and made proportional arrangements. As early as the first session of the NPC in 1954, Premier Zhou explicitly pointed out in his report on the work of the government: "In our country, the development of the economic construction should not be incompatible with the improvement of the people's livelihood because the sole aim of socialist economy is to satisfy the people's material and cultural needs. In order to fully satisfy the people's material and cultural needs, we must continuously develop the socialist economy. It is erroneous to place these two matters in opposing positions in any respect." Here, the interrelationship between production and livelihood has been fully explained. The 3d session of the 11th party Central Committee also pointed out clearly: "It is imperative to improve the livelihood of the people in the towns and the countryside step by step on the basis of developing production. The bureaucratic attitude of ignoring urgent problems in the people's livelihood must be resolutely opposed. On the other hand, since our economy is still very backward at present, it is impossible to improve the people's livelihood very rapidly." Comrade Ye Jianying reiterated in his speech on the occasion of the 30th anniversary of the founding of the PRC: "We must do a good job in combining our efforts to speed up economic development with the step-by-step raising of the living standards of the hundreds of millions of our people." This emphasized the point that the relationship between production and livelihood is that of dialectical unity and not of priority.

The slogan "production first, livelihood later" is contrary to the principle of gradually improving the people's livelihood on the basis of developing production. In an article entitled "Genuinely Make Clear the Socialist Production Aim" published in RENMIN RIBAO on 20 October last year, the contributing commentator said: "This slogan has mechanically separated developing production from improving the people's living conditions. It can easily give rise to various misunderstandings. According to this slogan, it seems that within a specific period of time, we may disregard livelihood and grasp production only. It may lead us to assume that 'production' is important because it comes 'first,' or assume that we should 'stress production and ignore livelihood.'" I think the commentator's analysis was correct. Production and livelihood have a relationship of dialectical unity. If we artificially separate them into "first" and "later," will we not be "separating them mechanically"? How long is the period between "first" and "later"? Is it half a year or 1 year? Is it 3 years or 5 years? Or is it even longer? According to the principle of "livelihood later," it will be all right to pay attention to livelihood later, no matter how much later. However, when livelihood is to be considered "later" and problems concerning living conditions always remain unsolved, we will be divorced from the people. Moreover, because this slogan puts undue stress on "production first," it obscures the aim of developing production. Thus, it is inevitable that the phenomenon of "stressing production and neglecting livelihood" has occurred. The fact that we have only wanted "bone" and not "flesh" in our economic life over a long period of time is strong evidence.

The above discussion illustrates that the slogan "production first, livelihood later" is in essence not a concrete realization of the principle of gradually improving the people's livelihood on the basis of developing production. We should by no means mix the two things up.

/III. Grave Consequences Caused by Mechanical Application of the Slogan "Production First, Livelihood Later"/

The slogan "production first, livelihood later" is not only untenable in theory, it has also caused extremely harmful consequences in practice because it has been mechanically applied as a principle of economic construction. However, some comrades do not agree with this view. They ask: Were the existing problems in the people's livelihood caused by Lin Biao and the "gang of four" or by "production first, livelihood later" or by mechanically applying the slogan "production first, livelihood later"? Frankly speaking, the deficiencies in people's lives which have been accumulating over the past years were not only caused by the sabotage of Lin Biao and the "gang of four," but also by the mistakes in our work, including the mechanical application of the slogan "production first, livelihood later." Some people dare not look squarely at the mistakes they have made in their work. Nor are they willing to recognize the grave consequences caused by the mechanical application of this slogan. They are blaming Lin Biao and the "gang of four" for all the difficulties in economic work. These people are not adopting a realistic attitude which revolutionaries should adopt.

For a long time, we have proceeded from the growth indexes of some major products, particularly products of heavy industries, rather than from the consumers' need in making national economic plans. In fact, we have taken steel as the key link and proceeded from heavy industries in formulating the national economic plan. This means that we have given priority to heavy industries which produce the means of production and have paid little attention to agriculture and light industries, which produce the means of subsistence and thus have direct relationship with the people's livelihood. Moreover, the previous five-year plans did not clearly state the targets for improving the people's material and cultural life. They only made arrangements for the production of heavy industries. Thus, the necessary improvement of the people's living conditions has been denied over a long period of time. Can we ever deny that this is an evil consequence caused by practicing the guiding principle of "production first, livelihood later"?

In dealing with the relationship between productive construction and nonproductive construction, we have stressed the former and overlooked the latter for many years, thus causing the severe imbalance in the proportion of "bone" and "flesh." In cities, we have attached great importance to the construction of factories but little importance to that of hospitals, schools, residences and transport facilities. The nets and points of commercial services have been decreased rather than increased. As a result, numerous problems have emerged in city construction and the people's livelihood. In launching a project, we have often built factories and put them into operation first but fail to build residences for the staff and workers and provide them with welfare facilities. These are facts which everyone knows. Are they not related to the guiding principle of "production first, livelihood later"?

/IV. Persisting in "Production First, Livelihood Later" Will Be Detrimental to Implementing the Principle of Economic Readjustment/

It will be extremely detrimental to the implementation of the principle of readjusting the national economy if we continue at present to stick to the slogan "production first, livelihood later." Through more than 1 year of efforts, our national economy has begun to develop toward the direction of coordination. However, the task of readjustment is still very difficult and the imbalance in various aspects has not been fundamentally remedied. Can we make readjustments according to the principle of "production first, livelihood later"? No, definitely not. This is because "production first, livelihood later" is one of the important factors which has upset the balance of the national economy. If we continue to make readjustments according to the erroneous guiding principle of "production first, livelihood later," we will worsen rather than remedy the imbalance between economic construction and the people's living conditions.

Comrades who advocate "production first, livelihood later" ask the following question: Is our livelihood adversely affected because we have firmly grasped production or because we have produced too little? Their answer is the latter, not the former. They think that the more we produce, the better it will be and that the more we produce, the better the people's livelihood will be. However, I think we should not speak in general terms. Instead, we should make specific analysis in the light of actual conditions. There is no doubt that we should develop production. However, the questions are: 1) What production should we develop and what purpose should production serve? 2) Should we develop production in proportion and work according to our capability? The existing problems are that our capital construction front has been overextended, steel and machinery industries have had excessive production and economic results have been very poor. If we continue to blindly extend capital construction and energetically develop the production of the steel, machinery and other heavy industries, we will certainly worsen the imbalance of the national economy, cause greater losses to economic construction and make it more difficult to improve the people's living conditions. Therefore, we must resolutely cut down this kind of production and construction instead of "increasing them indiscriminately."

What is our guiding principle in dealing with the interrelationship between economic construction and the people's livelihood and in readjusting the economy? With regard to this, Comrade Chen Yun has made an important speech. He said: "China has more than 900 million people. Over 80 percent of them live in rural areas. We must provide them with food and clothing and improve their livelihood each year. We must make arrangements for China's construction and economic life on this basis. The peasants are the majority. When proper arrangements have been made for them, China will be put under control." The main spirit of these remarks by Comrade Chen Yun is that we must genuinely work according to the socialist production aim. This is our guiding principle in dealing with the interrelationship between economic construction and the people's livelihood and in readjusting the economy.

We should improve the people's living conditions according to our capabilities on the basis of economic production and the enhancement of labor productivity. An important purpose of economic readjustment is to readjust the relationship between accumulation and consumption, to gradually solve the problem of deficiencies in people's lives which have been left over for many years, and to gradually raise the living standards of the people. The party and government have made tremendous efforts in recent years and have increased the income of most people in the towns and in the countryside. We must continue to improve the people's livelihood according to the capacity of our financial and material resources. However, we must understand that we are still in the period of readjustment, the financial and material resources of the state are limited, many difficulties are confronting us and problems in various areas which have been accumulating over the past years can only be solved gradually.

In short, we have learned lessons and drawn experiences in many aspects from the mechanical application of the slogan "production first, livelihood later." Two of them are the most important ones: 1) We should not depend only on slogans to guide economic work because economic life is complicated. Even if we have used correct slogans, questions of one kind or another will still emerge.
2) All slogans are restricted by objective conditions and have their own limitations. Still less should we use slogans which have been put forth under specific historical conditions for accomplishing specific tasks or for overcoming specific difficulties as general guiding principles.

PRC STRESSES CADRE TRAINING FOR READJUSTING ECONOMY

Vice Minister Comments

OW181001 Beijing Domestic Service in Mandarin 1200 GMT 16 Dec 80

[Text] At the national work conference on the education of economic cadres on 14 December, Ma Yi, vice minister of the State Economic Commission, pointed out: The training of cadres is an important task during the period of economic readjustments and we must make conscientious efforts to do this well.

Ma Yi said: A total of over 175,000 leading cadres of enterprises run by counties and higher authorities have been trained throughout the country this year. Through the training, these cadres have learned more about readjusting the economy, reforming the economic structure and consolidating the enterprises. Thus, they have advanced in their work.

Ma Yi pointed out: The central task of our country in the coming year is to continue to implement in an all-round way the policy of readjusting, restructuring, consolidating and improving the national economy. Readjustment is the key link. The sending of a considerable number of cadres and workers to receive training and the organization of study programs on a larger scale will not only enhance production and the proficiency of cadres and workers but will help set their minds at ease, killing several birds with one stone.

Ma Yi pointed out with emphasis: To do a good job in cadre education, all areas and departments must make concentrated efforts in the coming year to train by rotation all the leading cadres of enterprises run by counties and higher authorities who have not yet received training. Areas and departments now falling behind in cadre training must also provide training for all principal leading cadres in the coming year. Cadres who have already gone through rotational training should continue to study in an organized way so they will become management experts in their respective fields step by step. It is also necessary to continue to pay attention to the training of grassroots cadres and engineering and technical personnel--particularly young technical personnel.

Training Detailed

OW200206 Beijing XINHUA Domestic Service in Chinese 1405 GMT 18 Dec 80

[Text] Beijing, 18 Dec (XINHUA)--XINHUA reporters have learned from the work conference on the education of economic cadres called by the State Economic Commission that industrial and communications departments throughout the country have trained some 175,100 management cadres of enterprises run by counties or higher authorities this year, an unprecedented large number of cadres receiving training in rotation in China.

Since the beginning of this year, industrial and communications departments throughout the country have launched comprehensive work to train cadres. Industrial and communications cadres schools have been reinstituted or founded in 13 provinces, municipalities and autonomous regions and all the industrial and communications ministries and bureaus under the State Council have also reinstituted or founded 10 cadre schools. All localities and departments have set up long- or short-term training classes for cadres not engaged in production or partly released from productive labor according to the needs of those receiving training. These classes have provided training not only for leading cadres but for large numbers of technical and management cadres, workshop directors and section supervisors. Some provinces, municipalities and autonomous regions and industrial and communications departments under the State Council have sponsored special study classes for some 2,500 young and middle-aged cadres. Some 12,000 cadres have received training at 143 institutes of higher learning and secondary vocational schools throughout the country.

The State Economic Commission and other leading bodies have cooperated with the U.S. Commerce Department in setting up the Dalian Training Center for Chinese management of industrial science and technology. The main task of the training center is to sponsor a series of seminars to introduce U.S. industrial enterprise management experience and train senior managerial personnel. The duration of each seminar lasts 4 months. The first seminar concluded today.

At the cadre schools and training classes, the vast numbers of enterprise cadres systematically studied economic theory, enterprise management and advanced foreign experience. Some of the participants also studied other subjects, such as electronic computers, systems engineering, value engineering jia zhi gong cheng [0116 0237 1562 4453], education, psychology and behavioral science. Through study, the cadres have raised their consciousness in implementing the line, principles and policies of the 3d plenary session of the 11th CCP Central Committee and their capability to manage enterprises.

The State Economic Commission held the work conference on the education of economic cadres in Beijing 8-18 December to exchange experience in educating cadres and map out plans for training cadres in 1981. The conference called on all localities and departments to continue to do a good job in educating cadres and strive to complete the training for cadres of enterprises run by counties and higher authorities.

Training Session Plans

OW191254 Beijing XINHUA in English 1238 GMT 19 Dec 80

[Text] Beijing, December 19 (XINHUA)--More than 175,000 managers in China's big and medium-sized state-owned enterprises have graduated from training sessions of industrial and communications management this year.

As part of China's biggest program since 1949 to upgrade its factory and other leaders, the country plans to rotate managers of all industry, communications and transport enterprises through such training sessions before the end of 1981.

This was announced at a national meeting on training of cadres, called by the State Economic Commission from December 8 to 18.

Ministries related to industry, transport and communications as well as the authorities of 13 provinces, municipalities and autonomous regions now run full-time schools of management. These are supplemented by short-term training classes attended by trainees on full-time or part-time basis. In addition, well over 12,000 factory leaders have also received training this year at 143 secondary technical schools and schools of higher learning.

Aside from studying fundamentals of economics and management, many trainees have picked up courses which are relatively new to China, including computer technology, systems engineering, behavioural sciences and psychology.

CSO: 4006

CIRCULAR STRESSES HOLIDAY TRANSPORTATION TASK

OW200127 Beijing XINHUA Domestic Service in Chinese 0805 GMT 18 Dec 80

[Text] Beijing, 18 Dec (XINHUA)--The State Economic Commission issued a circular on 12 December calling on all provincial, municipal and autonomous regional economic committees and the railway, transportation and civil air departments to take effective measures to strengthen the passenger transportation task. The railway and other transportation departments are planning to use a number of boxcars and freight cars to transport passengers during the Spring Festival to increase carrying capacity.

The circular says: Since the beginning of the second half of this year, the economy in urban and rural areas has become more stimulated and the railway, highway and waterway passenger transportation volume has sharply increased. Latest statistics show that on average, the railway, highway and water transportation departments have to move over 10 million passengers each day. This is 26 percent above last year's average daily passenger volume. This sharp increase in the number of passengers and insufficient capacity have resulted in passengers being unable to obtain tickets or to board trains even with tickets and in a very serious overloading situation. As the 1981 New Year's Day and the Spring Festival draw near, the number of vacationing workers, students and people returning home will surely soar and make passenger transportation work still more difficult and immense. For this reason, all provincial, municipal and autonomous regional economic commissions and railway, transportation and civil air departments at all levels must list passenger movement in their important work agenda. They must attach equal importance to passenger and cargo transportation, adhere to the principle of overall planning and rational arrangements and do all they can to tap transportation potential. In case of conflict between passenger and cargo transportation, it is imperative to properly insure the normal transportation of passengers.

The circular says: The peak daily passenger transportation volume during the Spring Festival holidays is expected to surpass 12 million. To guarantee the fulfillment of the Spring Festival passenger-transportation task, the following measures should be taken: 1) Extend the Spring Festival passenger-transportation period; 2) use freight cars and vessels to transport passengers; 3) strive to create more space in cars and vessels; and 4) increase the utilization rate of cars and vessels.

The circular also calls on all units to pay attention to passengers' safety and take effective measures to prevent accidents. They must conduct safety education among workers, strictly enforce the system of personal responsibility and adhere to the rules and regulations relating to passenger transportation. Vehicle, ship and airplane operators must operate strictly according to safety regulations. Operation in violation of safety regulations is prohibited. Order at stations and ports and in passengers' boarding and alighting from cars and ships must be maintained. Limits on passengers' luggage must be strictly enforced. Meticulous examination must be made to prevent flammables, explosives and hazardous items from getting onto vehicles, ships and airplanes. More efforts should be made to check against cold and frostbite and on safety measures to eliminate any hidden hazards so as to insure safe transportation.

The circular expresses the hope that all related units improve their passenger services.

NATIONAL POLICY AND ISSUES

PRC MEETING DISCUSSES AIM OF SOCIALIST PRODUCTION

OW111436 Beijing XINHUA Domestic Service in Chinese 1405 GMT 10 Dec 80

[Text] Beijing, 10 Dec (XINHUA)--A 7-day national meeting to discuss the purpose of socialist production ended in Beijing today. It was a grand academic meeting held nationwide by the country's economic theoretical circles since the founding of the People's Republic. Through discussions, the participating economic theorists and economic affairs workers have furthered their probing into the basic socialist economic laws, both in theory and in practice, and gained a better understanding of the necessity and importance of the national economic readjustment.

Although China has carried out socialist construction in the past 30 years and more and has scored many achievements, the question of what is the purpose of socialist production still remains, the participants pointed out. For a long time the nation was entirely absorbed by accelerating economic growth, rushed headlong to expand the scale of capital construction, ignored the people's livelihood, put undue emphasis on developing the heavy industry and attached little importance to the growth of agriculture and light industry. This has resulted in the divorce of production and construction from the people's livelihood and created a serious imbalance between financial accumulation and consumption, thereby betraying the purpose and requirements of socialist production.

The participating comrades pointed out that to satisfy the needs in the people's material and cultural life is the purpose of socialist production. In production and construction, we must first of all, make proper arrangements for producing means of subsistence in accordance with the people's consumption needs and make appropriate arrangements for producing means of production needed for producing means of subsistence while insuring a proper proportional relationship among the various national economic departments. Only by proceeding from this point of departure can we succeed in readjusting the national economy.

An analysis of the many causes leading to the failure in the past many years in realizing the purpose of production was made by the participants at the meeting. They said the most fundamental cause leading to this failure was the influence of the leftist line. They added that their discussion meeting would have an important bearing on the elimination of the leftist line's pernicious influence. They said that the economics circles should make positive and valuable suggestions on the country's national economic readjustment.

The discussion meeting was one of liveliness and vitality during which the participants spoke out their own views freely without any reservation. It gave full scope of the spirit of democratic discussions.

A decision was adopted at the meeting to edit and publish as soon as possible collected essays on the purpose of socialist production.

PROGRESS REPORTED ON EXPERIMENT TO GIVE ENTERPRISES MORE POWER

OW030312 Beijing XINHUA Domestic Service in Chinese 0710 GMT 1 Jan 81

[Report by Li Niangui, XINHUA correspondent]

[Excerpts] Beijing, 1 Jan (XINHUA)--Encouraging progress and obvious results have again been achieved in 1980 in our country's experiment on giving enterprises enlarged powers for managing their own affairs.

More than 4,000 enterprises were selected in the whole country in 1979 for enlarged powers of self-management on an experimental basis. The number was increased to more than 6,000 in 1980. Of these enterprises, 191 also began to "pay taxes instead of handing in their profits to the state, maintain independent accounting and assume responsibility for their own profits and losses" on an experimental basis. The more than 6,000 enterprises in the experiment accounted for 16 percent of the 42,000 industrial enterprises in the state budget, their output value accounted for about 60 percent of the total, and their profits accounted for about 70 percent of the total.

All the enterprises with enlarged powers to manage their own affairs have achieved improved economic results. According to initial statistics for 5,422 enterprises in the experiment, their total industrial output value for the period January through September in 1980 increased by 12 percent over the same period in 1979; their total profits increased by 17 percent over the same period; and the profits they handed over to the state increased by 13 percent over the same period. Enterprises given enlarged powers of self-management in general showed greater increases in output value and profits than enterprises not given such powers.

With enlarged power to manage their own affairs, the enterprises are able to improve the livelihood and welfare for their workers and staff members step by step on the basis of increased production.

A responsible comrade of the enterprise bureau under the State Economic Commission told this correspondent: In our country's experiment on giving enterprises enlarged power in managing their own affairs, the orientation is correct, the pace is steady and safe, and the results are obvious. However, there are also some problems in practice. For example, development is uneven between areas and between trades; due to restrictions by the present management system, reforms in various fields still lack coordination; some of the powers that should be given to the enterprises, as stipulated by the State Council, have not been fully exercised; in the course of giving enterprises enlarged powers for managing their own affairs, macroeconomic guidance and supervision have lagged behind; in the use of funds retained by the enterprises, there has been some blindness, and some enterprises have issued too many bonuses; and so on. In regard to these problems, it is necessary to analyze the causes, sum up experiences and take measures to solve them, so that the enterprises already given enlarged powers of self-management will be consolidated and improved and so that the results of this reform can be further developed. It is necessary to correctly handle the relationship between this reform and the readjustment of the national economy so that the reform will be conducive to the readjustment.

BRIEFS

NEW TIME STANDARD--Beijing, 31 Dec (XINHUA)--The Central People's Broadcasting Station will change to Coordinated Universal Time (UTC) in sounding its time signals for civilian use beginning 0800 Beijing Time [0000 GMT] on 1 January 1981. This new time signal will be broadcast by the Beijing Observatory of the Chinese Academy of Sciences through the Central People's Broadcasting Station. The Coordinated Universal Time (UTC) is a time standard universally adopted in the world at present. Its time difference is maintained within the range of 0.8 second plus or minus from the Universal Time International (UTI) that has always been in use in China. ECONOMIC PLANNING

'RENMIN RIBAO' ON SCIENTISTS' ROLE IN ECONOMIC WORK

HK110336 Beijing RENMIN RIBAO in Chinese 27 Nov 80 p 3

[Commentator's article: "Gratifying Attempt at Espousing the Integration of Science and Technology With the Economy"]

[Text] The China Association of Scientists has organized more than 20 specialists from 18 academic groups to go to Anhui for inspection and for consultations about major problems of economic construction in that province. This has been commended by various quarters. People are full of praise for the specialists' spirit of service and for the inspection team's contributions. They particularly approve of the way scientific and technological work is integrated with economic work.

As part of the productive forces, science and technology are inherently related to economic development. The development of the national economy is dependent on science and technology and requires that people doing scientific and technological work, particularly scientific research, try hard to solve problems of economic construction and, at the same time, receive the serious attention and support of economic departments. However, due to our defective economic and scientific research systems, for a long time, science and technology have been as unrelated to the economy as "two pieces of leather." Many comrades who are engaged in economic work are unfamiliar with the power of science and technology. When it comes to construction, they ask for investment, equipment and huge manpower resources. If our four modernizations are promoted in this way, they will have no outlet for realization. Moreover, some comrades who are engaged in scientific and technological work are confused about how science and technology can help economic construction. With "departmental ownership" and "regional ownership" splitting and inhibiting our surviving scientific research forces, nothing can be done for the four modernizations even if we wanted to.

Such a situation should not be allowed to go on! If this is so, where is the way out? Many intelligent people in economic as well as scientific and technological circles have been pondering this question and actively exploring ways and means to remedy it. Fundamentally speaking, it is imperative that positive efforts be made to reform the existing economic and scientific research systems so that all production enterprises will be forced to rely on science and technology. Moreover, only by steadily making new contributions to production and construction can the majority of scientific research units, which are mainly engaged in the study of technological development, obtain the economic backing of various quarters. Regardless of whether they are enterprises or scientific research units, all should smash the fetters of "departmental ownership" and "regional ownership" and take the road of socialization.

To succeed in reforming systems of a fundamental nature is a very complex and difficult task. We must not expect that we can accomplish this overnight. However, without taking the first step, it is impossible to travel a thousand li. We should all warmly welcome any positive step taken on the road of reform.

In organizing specialists to go to Anhui for an inspection tour, the China Association of Scientists has taken a gratifying step forward in the direction of espousing the integration of science and technology with the economy and of socializing scientific research work. Anhui Province is prepared to vigorously develop the coalfields in Huaiiin and Huainan and natural resources in west Anhui. It is no longer following the beaten track of having the leadership draw up the plans, having the planning departments figure out the amount to be invested and having huge manpower resources pitch in at an accelerated pace. Instead, the province will invite specialists to conduct investigations and studies and will rely on scientific and technological forces to struggle against nature. Specialists from all over the country and from a dozen different trades and professions are gathered in the province. For the time being, they will at least free themselves from the restrictions imposed by their own "departments" and "regions" and learn more about science in order to release the productive forces of scientific research. In fact, various spheres of economic construction need specialists to find ways and means. In order to surmount difficulties, they also need departments which oversee scientific and technological work. If various departments and localities do this and take firm steps forward, then there is great hope that science and technology integrated with the economy will thrive.

BRIEFS

GUANGDONG ECONOMIC DISCIPLINE SURVEY--The Guangdong provincial people's government recently decided that an inspection of financial and economic discipline would be carried out starting in late November in order to strengthen financial and economic work. The aims of this inspection are: 1) To grasp this year's financial revenue and expenditure and insure a balance with a slight surplus; 2) to strengthen concepts of the legal system and to correct bad workstyles; 3) to speed up the process of increasing output and practicing economy; 4) to further implement the eight-character principle and grasp well readjustments of the national economy; and 5) cut down the scale of capital construction and speed up the four modernizations. [HK120638 Guangzhou Guangdong Provincial Service in Mandarin 2345 GMT 30 Nov 80 HK]

GUIZHOU ECONOMIC READJUSTMENT--According to a GUIZHOU RIBAO report, the Guizhou provincial people's government has organized work groups to inspect implementation of the State Council's circular and the provincial circular on economic readjustment throughout the province. The work groups consisted of 41 leading comrades and some 200 cadres. The Guizhou provincial people's government held a mobilization rally for the work groups on 24 December, demanding that all work groups do the following: 1) Strictly control commodity prices and rectify sale by negotiations; 2) strictly forbid indiscriminate lumbering; 3) resolutely reduce the number of capital construction projects; 4) speed up stocktaking and help circulation of capital. [HK310544 Guiyang Guizhou Provincial Service in Mandarin 2315 GMT 24 Dec 80 HK]

HEILONGJIANG URBAN PLANNING CONFERENCE--The Heilongjiang provincial people's government held a conference on urban planning from 23 to 27 December in Harbin Municipality. Attending the conference were leading comrades of various counties and municipalities. They revealed that by the end of November, housing totaling 2.087 million square meters in floor space had been completed. [SK311047 Harbin Heilongjiang Provincial Service in Mandarin 2200 GMT 29 Dec 80 SK]

JIANGSU POPULATION DOCTRINE CONFERENCE--Sponsored by the Ministry of Education, China's first conference on the doctrine of population was held in Jiangsu's Nanjing City from 5 to 10 December. Attending the conference were representatives from 10 selected middle schools which have conducted education on population control on a trial basis and 10 institutes which are now training teachers for education on population theory. They summed up experience and discussed how to promote education on population control with still better results. To pave the way for further promotion of family planning among the people, the Jiangsu Provincial Education Institute has trained some 120 teachers for various schools. [Nanjing Jiangsu Provincial Service in Mandarin 1100 GMT 10 Dec 80 OW]

JIANGSU MANAGEMENT CONFERENCE--The Jiangsu provincial conference on agricultural management of the people's communes in the rural areas was held in Nanjing on 26 December. The conference stressed that it is necessary to combat left-deviationist influence in order to achieve steady agricultural development. It said that it is necessary to correct the erroneous idea of pursuing a high production target while work efficiency and people's income is low. The conference pointed out that people's communes must launch their farmland capital construction according to their ability and importance must be attached to the construction projects' efficiency, and that, while insuring grain production, natural resources and manpower should be fully utilized for diversifying the economy. [OW311229 Nanjing Jiangsu Provincial Service in Mandarin 2300 GMT 26 Dec 80 OW]

JILIN POPULATION SOCIETY--The Jilin Provincial Society of Population Science was established recently. The board of directors was elected at the first meeting of the society. The 32 theses and investigation reports submitted to the meeting include such topics as population and economy, population and employment, population and eugenics and current situation in Jilin Province. Various research groups specialized in population theory, eugenics, population planning, birth control, and issues concerning urban, world and minority population will be established next year. Leading comrades including Wang Daren, secretary of the provincial party committee, Zhang Kaijing, vice chairman of the provincial People's Congress Standing Committee, and Guan Mengjue, vice chairman of the Provincial CPPCC Committee, attended the meeting. Representatives of population theoretical research institutes and family planning offices in Heilongjiang and Liaoning provinces and the Shenyang PLA units also attended the meeting and delivered academic reports. [SK141228 Changchun Jilin Provincial Service in Mandarin 1100 GMT 8 Dec 80 SK]

LIAONING ENTERPRISE MANAGEMENT--Shenyang, 11 Dec (XINHUA)--Since September 1979, 262 state-run enterprises in Liaoning Province have experimented with added decisionmaking power. As a result, most of them have increased production and made more profit. With added decisionmaking power, they are entitled to retain a certain percentage of the profits they make. The 262 enterprises account for 13 percent of the total number of state-run enterprises in Liaoning Province. [Beijing XINHUA Domestic Service in Chinese 0300 GMT 11 Dec 80 OW]

SHAANXI URBAN PLANNING CONFERENCE--The Shaanxi provincial people's government recently held a conference in Xian on urban planning work. The conference demanded that leaders at all levels attach importance to urban planning work and do well in grasping urban administration and urban construction. In urban planning work, it is necessary to strictly control large cities, rationally develop medium-sized towns and actively develop small towns. From now on, Xian will no longer make arrangements for building new large and medium-sized industrial projects but will build satellite towns and townships in a planned way. It will move factories that use a large quantity of water and cause serious pollution out of the city. At present, it is essential to pay special attention to building residential houses in urban areas. People's governments in all prefectures, municipalities and counties must inspect the allocation of residential housing before the end of this year. [Xian Shaanxi Provincial Service in Mandarin 1100 GMT 6 Dec 80 HK]

SHANXI ENTERPRISE MANAGEMENT FORUM--The Shanxi provincial people's government held a forum from 26 November to 6 December on enterprise management. The forum held: It is necessary to rectify enterprise management in order to implement the eight-character principles. Guo Yinan, the provincial vice governor, presided over the forum and spoke. Some units exchanged their experiences in enterprise management at the forum. The forum held: It is necessary to maintain stability and unity in the political situation and promote younger persons to the leadership group in order to carry out rectification of enterprise management. The forum also called for perfecting the system of workers' congresses to bring democracy into full play. In conclusion, the forum stressed that the rectification of enterprise management must be closely linked with the expansion of decisionmaking rights of enterprises. [Taiyuan Shanxi Provincial Service in Mandarin 2300 GMT 6 Dec 80 HK]

BRIEFS

GUIZHOU FINANCE REVENUE--According to statistics of the Guizhou Finance Revenue Department in the first half of December 1980, the people in Guizhou have overfulfilled the year's finance revenue tasks by 4.09 percent 21 days ahead of schedule. By the end of November according to incomplete statistics, the finance revenue and profits from the light and textile industries increased by 21.33 percent over the corresponding period of last year. [HK291010 Guiyang Guizhou Provincial Service in Mandarin 2315 GMT 18 Dec 80 HK]

GUANGDONG SUPPORT FOR AGRICULTURE--Since the beginning of this year, all agriculture banks and credit cooperatives have strengthened support for agriculture. By the end of November, the total amount of rural savings throughout the province was 1.344 billion yuan, 466 million yuan more than at the end of last year. Per capita savings in rural areas was 29.21 yuan. The province issued loans of some 2.43 billion yuan to communes and brigades for the purpose of agricultural production, 1.4 times greater than in the corresponding period of last year. The loans for commune and brigade enterprises increased by 2.8 times. The loans to communes and brigades for building small hydroelectric power stations were some 150 million yuan. In the past 11 months, the banks and cooperatives recovered loans of 1.3 billion yuan which were due or overdue, some 550 million yuan more than in the corresponding period of last year. [HK310539 Guangzhou Guangdong Provincial Service in Mandarin 2345 GMT 27 Dec 80 HK]

HEILONGJIANG AGRICULTURAL LOANS--As of 25 December, Heilongjiang Province had collected some 387.5 million yuan of agricultural loans, 36 million yuan more than in 1979. Some 56 municipalities and counties in the province had overfulfilled the 1980 agricultural loan collection plan ahead of schedule. [Harbin Heilongjiang Provincial Service in Mandarin 2200 GMT 3 Jan 81 SK]

JIANGXI TAXATION REVENUE--The taxation affairs departments of Wuyuan, Yihuang, Dongxiang, Jian, Xiajiang, Ninggang, Guangchang and Shicheng counties, and Jinggangshan in Jiangxi Province have overfulfilled their quotas for taxation revenue for 1980, 2 months ahead of schedule. Revenue has amounted to 25.35 million yuan, an increase of 3.42 million yuan over the same period last year. Taxation affairs departments of all counties have encouraged enterprises to submit revenue plans and worked out new measures to prevent debits by communes and enterprises, thus, increasing revenue. [Nanchang Jiangxi Provincial Service in Mandarin 1100 GMT 4 Dec 80 HK]

JIANGXI BANK DEPOSITS--According to incomplete statistics compiled for January to October in 4 municipalities under the jurisdiction of the provincial government, 6 municipalities under the jurisdiction of the prefectural governments and 80 counties, the people's banks at all levels in Jiangxi Province had 728,159 new accounts opened by enterprises, organs, organizations, urban collectives, special foundations, industrial and commercial units and individuals and deposits amounted to 29,326 yuan. The people's banks are now making full use of the deposits to support industrial production and circulation of commodities. [Nanchang Jiangxi Provincial Service in Mandarin 1100 GMT 6 Dec 80 HK]

JIANGXI MONEY CIRCULATION--By early December 1980 the currency in circulation throughout Jiangxi was reduced by 5.4 percent over the corresponding period of last year. This year, the Jiangxi branch of the People's Bank of China has relentlessly grasped the withdrawal of currency from circulation. In accordance with the principle of six superiorities, the Jiangxi branch of the People's Bank of China has actively supported the light and textile industry and the development of the collective industry. By the end of November 1980, the collective industrial loans in the cities and towns throughout the province has increased by 36 percent over the end of 1979, accounting for 50.2 percent of the total industrial loans. This year, income of the staff and workers has generally been increased. By early December 1980, savings of the enterprises throughout the province increased by 31 percent over the end of 1979. [Nanchang Jiangxi Provincial Service in Mandarin 1100 GMT 20 Dec 80 HK]

JILIN REVENUE--As of 20 December, Jilin Province had overfulfilled its annual state-assigned financial revenue quota by 6.3 percent, showing an increase of 8.7 percent over the figure for the corresponding 1979 period. Banking departments throughout the province, by the end of November, had allotted 240 million yuan to support industry, especially light and textile industries. [Changchun Jilin Provincial Service in Mandarin 1100 GMT 31 Dec 80 SK]

JILIN TAXES--By 20 December tax departments in Jilin Province had collected 1,122,340,000 yuan of industrial and commercial taxes, an increase of 5.6 percent over the figure for the corresponding 1979 period. [SK291321 Changchun Jilin Provincial Service in Mandarin 1100 GMT 28 Dec 80 SK]

NEI MONGGOL MUNICIPAL TAX--Hohhot Municipality, Nei Monggol, had collected 107 million yuan of industrial and commercial taxes by the end of November, prefulfilling its annual industrial and commercial tax plan by 1 month. [SK120857 Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 4 Dec 80 SK]

SHAANXI RURAL SAVINGS--By the end of November, Shaanxi Province's rural savings amounted to 274 million yuan, showing an increase of 24.69 million yuan over the same period last year and overfulfilling the year's quota by 48 percent. The total amount of savings this year was 620 percent of the total amount of savings in 1966. The proportion of fixed deposits accounted for 72 percent of the total amount of savings. [Xian Shaanxi Provincial Service in Mandarin 2300 GMT 24 Dec 80 HK]

SHANXI AGRICULTURE TAX REDUCED--The State Ministry of Finance has decided to reduce Shanxi Province's agriculture tax by 10 million yuan due to natural disasters. Shanxi Province has faced severe natural disasters this year and production was affected. By now, the province has implemented the decision of the Ministry of Finance and has distributed tasks among various areas in accordance with the degree of damage caused by the disasters. [Taiyuan Shanxi Provincial Service in Mandarin 2300 GMT 25 Dec 80 HK]

XINJIANG OVERSEAS REMITTANCE--Thanks to the earnest efforts of the people's banks at all levels to implement the government policy on Overseas Chinese, a rapid increase of money remitted by Overseas Chinese has been registered in Xinjiang Autonomous Region. The region has received 980,000 yuan of remittances by November this year, representing an all-time record. The banks are now planning to adopt even more effective methods to provide better service to both Overseas Chinese and their relatives in Xinjiang. [Urumqi Xinjiang Regional Service in Mandarin 1300 GMT 9 Dec 80 OW]

XIZANG FINANCIAL WORK--The Xizang regional conference on cultural, education, administrative and financial work was held 10-17 December. The meeting stressed the need to strengthen leadership over financial and accounting work because the fixed budget system for various units will be implemented in the region on a trial basis. The participants are convinced that financial and accounting work has an important bearing on promoting the national economy and that leading cadres must acquire adequate knowledge of financial and accounting work. They also stressed the need to speed up the training of financial and accounting workers. [OW041609 Lhasa Xizang Regional Service in Mandarin 1130 GMT 30 Dec 80 OW]

SHAANXI STATISTICAL WORK--Since the smashing of the "gang of four," Shaanxi Province has resumed its statistical work and gradually given play to the administrative and supervisory role of statistical work in the national economy. Of the 115 units at prefectural, municipal and county level throughout the province, 109 have set up statistical bureaus, which have involved some 700 cadres in statistical work. The province has begun investigation of the rural economy and family life of staff and workers. The provincial computer center has been initially established, thus laying a foundation for our province's modernized calculation techniques. To quicken the pace of statistical work, the provincial people's government held a meeting of statistical bureau directors in mid-November. HONG KONG PAPER ON PRC OIL PROSPECTS

South China Sea Oil

HK050322 Hong Kong HSIN WAN PAO in Chinese 3 Jan 81 p 1

[Report: "Three South China Sea Oilfields Enter the Exploitation Stage"]

[Excerpts] Guangzhou, 3 Jan--A responsible person of the South China Sea Branch Company of the China Petroleum Company told your correspondent that quantities of recently acquired geophysical survey data show that there are rich petroleum sources on the continental shelf in the northern part of the South China Sea. It will become a petroleum base with very great development prospects.

Prospecting the oil resources of the continental shelf in the northern part of the South China Sea began in 1973.

The large amounts of data collected show that there are three large sedimentary basins covering a total area of 206,000 square kilometers in the northern part of the South China Sea. These basins are in the Beibu Gulf, Yinggehai, and the Pearl River estuary. These three basins contain thick oil-bearing strata, conditions for yielding oil are good, there are many different types of oil, and industrial oil gas has already been obtained there. There are ample conditions for extensive prospecting and exploitation.

Comments on Oil Situation

HK050518 Hong Kong HSIN WAN PAO in Chinese 3 Jan 81 p 1

["New Talk" column: "Looking Toward the South China Sea; Thinking of Beijing"]

[Text] Good news has come from Guangzhou with the new year: The South China oilfields have now started to enter the exploitation stage. China has signed a prospecting and exploitation agreement with France, and a similar agreement has been initially signed with the United States. Previously there was only prospecting going on, and now prospecting has led to exploitation.

People previously talked a lot about the oilfield in the Pearl River estuary, and now oilfields have also been discovered at Yinggehai, off Hainan Island, and in the Beibu Gulf, not far away. Moreover these are fields with great development prospects. China's future oil hopes are pinned on marine oilfields and now these hopes are starting to be translated into reality. This prospect does not appear as unrealistic as those brave words about building 10 Daqings.

Our exclusive report on oil a few days ago was rather discouraging; it said that China's oil production would remain stagnant in the next 7 years even if it did not decline, and that generally speaking the output would fall rather than rise. The beautiful dreams that resulted from the brave words about building 10 Daqings have come to nothing. People are very despondent about this. However, the report also pointed out that China's hopes are pinned on marine oilfields; there is a lot of oil in the sea. However, an increase in oil production will only come about after 7 years.

Exploration of the South China Sea oilfields began 7 years ago, in 1973. By a curious coincidence, it has also been 7 years from prospecting the oilfields to exploiting their rich yield. We will have to put up with another 7 years of irritation in poor oil output.

We will also have to suffer for the next 3 to 5 years while the national economy is being readjusted.

The reason for extending the readjustment is that the principle of readjustment, restructuring, rectification and improvement was not seriously implemented after being put forward in 1979, while in addition the situation was found to be serious and worse than expected. It was serious because errors were made for 2 years (1977 and 1978) on top of the 10-year catastrophe. And the errors of those 2 years were again due to the influence of extreme "leftist" thought; we were impatient for success, hankered for the grandiose, and indiscriminately imported foreign technology. This all formed into a "foreign leap forward."

The New Year's Day editorial of RENMIN RIBAO said: "From now on, we have truly shaken off the bindings of 'leftist' thought and embarked on the path of healthy development."

The person responsible for the 2 years of errors must thus give way; of course, there may have been still greater mistakes than those, and not just errors either.

ENERGY SPECIALISTS URGE USE OF GEOTHERMAL SOURCES

OW050750 Beijing XINHUA in English 0700 GMT 5 Jan 81

[Text] Beijing, January 5 (XINHUA)--Geothermal energy should be given importance in the state plan, said specialists at a current national meeting on the development of energy resources here.

Associate Professor Cai Yihan of Tianjin University said that China has more than 2,500 hot springs. They are found in all provinces, municipalities and autonomous regions. This includes 600 hot springs with 80 degrees C temperature and above. The geothermal sources are found mainly in the southeastern coastal provinces and the southeastern part of the Qinghai-Tibet plateau. The Yunnan-Tibet belt is a geothermal area, in which 700 hot springs have already been found.

Engineer Shi Deming enumerated some good qualities of geothermal energy. He said that it is easy to exploit, convenient to use, needs only simple equipment, has a high rate of utilization and causes less pollution. Substantial exploitation of geothermal as well as other new energy sources can, to a certain extent, make up for the limited supply of conventional energy sources such as coal and oil.

Apart from generating electricity, geothermal sources in China are already being used to breed fish, grow vegetables, fruit and flowers, hatch chickens and dry harvested grain as well as for medical uses, and heating and bathing.

Associate Professor Cai Yihan pointed out that the exploitation and utilization of geothermal sources is still in its infancy in China. Research and field surveys are necessary.

PRC SCIENTISTS NOTE RURAL ENERGY NEEDS

OW030837 Beijing XINHUA in English 0825 GMT 3 Jan 81

[Text] Beijing, January 3 (XINHUA)—Finding more energy sources in China's vast rural areas is vital for progress, said scientists attending the current Second National Symposium on Energy Sources here.

Professor Yang Jike of the Chinese University of Science and Technology in Hefei warned that China's rural areas were critically short of fuel for daily use. Of 800 million rural population, 500 million did not have enough firewood for three to five months a year. The number of peasant households lacking in fuel in the hardest-hit province accounted for 70 percent of the total; in the best province it was 25 percent. As a result, in many places, trees, crop stalks and roots, weeds were dug up almost at all. [as received] In quite a few areas, peasants used dried manure from domestic animals as fuel for cooking. In a few regions, people used dried sweet potato chips as firewood.

Professor Yang Jike said that apart from the hardship this created for the peasants, the situation caused an ecological imbalance. Further, the use of these substitutes for coal and gas meant great waste since they are inefficient sources of heat.

At present, annual output of forest products for fuel now could satisfy only two months need for China's rural areas, scientists said. They urged wide expansion of forests for fuel. China had 66 million hectares of wasteland and barren hills suitable for trees, they said. These were to be afforested within the next 20 years, and speakers asked that at least one-fifth of the amount be set aside to meet fuel needs.

Speakers also urged wider use of methane (marsh gas) and improvement of the country's 20,000 small coal mines.

The meeting is being held by the State Scientific and Technological Commission. It has asked 280 specialists in energy sources from all over the country to explore measures for China to meet its growing energy needs.

CSO: 4020

BRIEFS

RURAL ELECTRICITY CONSUMPTION--Beijing, 29 Dec (XINHUA)--China's countryside consumed 37 billion kWh of electricity in 1980, showing a 13.8 percent increase over 1979, the biggest ever increase since the founding of the republic. Counting the electricity consumed by county-run enterprises directly serving agricultural production, the countryside's electricity consumption accounts for a quarter of China's total electricity consumption. About 90 percent of China's communes, over 60 percent of the production brigades and over 50 percent of the production teams are supplied with electricity, irrigating a total of 280 million mu of farmland. Some 400 counties consume 50 million kWh of electricity per year, of which 100 consume over 100 million kWh of electricity a year. Power transmission lines in the countryside total 3.1 million kilometers in length. [Beijing XINHUA Domestic Service in Chinese 0721 GMT 29 Dec 80 OW]

EAST CHINA POWER OUTPUT--The East China Power System has fulfilled its 1980 plan of generating 44 billion kWh of electricity 2 days ahead of schedule. The total power output is 6.8 percent higher than last year. Thanks to unified management and rational use of hydraulic energy, the East China Power System has generated 1.55 billion kWh of electricity more than its original plan this year. This year the system has also installed new generators capable of generating 722,000 kWh of electricity as well as 143 kilometers of high-voltage transmission cables. [Shanghai City Service in Mandarin 1130 GMT 29 Dec 80 OW]

HYDROPOWER STATIONS--More than 4,000 small hydroelectric power stations have been built in various places of the country during 1980 with a total generating capacity exceeding 800,000 kilowatts. Now there are more than 90,000 small hydroelectric power stations in the vast rural and pastoral areas in China with a total generating capacity of 7 million kilowatts. [Beijing Domestic Service in Mandarin 1200 GMT 31 Dec 80 OW]

ANHUI ELECTRIC POWER--As of 27 December, Anhui Province fulfilled its annual power generation plan 4 days ahead of schedule. It is estimated that by the end of the year, the total electric power generation will be 9.56 billion kWh, 100 million kWh more than 1979 power generation. Of this year's power generation, 750 million kWh were generated by hydroelectric power stations in the province. [OW011929 Hefei Anhui Provincial Service in Mandarin 1100 GMT 28 Dec 80 OW]

ANHUI POWER PROJECTS--A number of large and medium-sized power transmission cables and substations were put into operation in Anhui in 1980. They include the 213-km 220-kilovolt transmission line linking Bangbu, Chuxian and

(Jiliangshan), and the 58-km 110-kilovolt Guoyang-Lixin-Kantuan transmission line, and seven 70,000-volt substations. In 1980, in keeping with the third-stage expansion project of the Huaibei power plant, 110 km of 220,000-volt transmission cable linking Huaibei to Bangbu and 62 km of 110,000-volt transmission lines from Qiaotouji and (Liuqiao) and from Suxian to Nanping were erected. [Hefei Anhui Provincial Service in Mandarin 1100 GMT 1 Jan 81 OW]

GUANGDONG HYDROELECTRIC POWER--According to statistics, by the middle of December, Guangdong Province had built and put into operation 528 small hydroelectric power stations this year with installed capacity of 127,000 kilowatts, fulfilling 127 percent of the state quota. The installed capacity was 10,000 kilowatts more than last year, an increase of 8.6 percent. The installed capacity of all small hydroelectric power stations throughout the province is some 9.92 billion kilowatts for each season. In 1979, the electricity output of all small hydroelectric power stations throughout the province was 2 billion kilowatt-hours, approximately one-fifth of the total electricity output of all hydroelectric power and thermal power stations throughout the province. Apart from supplying electricity for agricultural use, these small hydroelectric power stations also supplied 500 million kilowatt-hours to the large electricity network. Banks have provided sufficient loans to develop small hydroelectric power stations. The provincial people's bank has issued loans of some 31 million yuan this year. [HK020717 Guangzhou Guangdong Provincial Service in Mandarin 2345 GMT 28 Dec 80 HK]

HEILONGJIANG SMALL COLLIERIES--Harbin, 23 Dec (XINHUA)--In an effort to consolidate coal industry, Heilongjiang Province has closed down or suspended the operations of 169 small coal mines during the second half of this year. These small coal mines did not meet the standard requirements for coal mining, including the safety requirement. [OW290057 Beijing XINHUA Domestic Service in Chinese 0229 GMT 23 Dec 80 OW]

HEILONGJIANG TURBOGENERATORS--The Harbin Electric Machinery Plant has successfully produced China's first 125,000-kW water turbogenerator set to be used in the Changjiang River's large hydropower station--(Gezhouba) power station. This set of generators is 34 meters high and weighs 3,200 tons. [Harbin Heilongjiang Provincial Service in Mandarin 1100 GMT 31 Dec 80 SK]

HEILONGJIANG COAL CUTTER--Harbin, 3 Jan (XINHUA)--A coal-cutting machine designed for use of narrow coal seams has been put into serial production in northeast China. Designed by a research institute of coal in Heilongjiang Province, the machine can cut up to 365 tons of coal an hour, will be used to replace the drilling-and-blasting method in coal seams from 0.8 to 1.3 meters in thickness. The thin and ultrathin coal seams account for more than half of the total in Heilongjiang Province, an important coal center, and for a significant percentage of the national total. Up to now, miners have had to crawl on all fours while extracting coal from such seams. [Text] [Beijing XINHUA in English 0818 GMT 3 Jan 81 OW]

HUBEI WATER CONSERVANCY--At 10.30 a.m. on 24 December, the lower reaches of the (Gezhou) dam were officially opened. The project was approved and planned by the Ministry of Water Conservancy, the Ministry of Electric Power Industry and the Ministry of Communications. (Liu Sutian), vice minister of water conservancy, inaugurated the opening of the dam. Qian Zhengying, minister of water conservancy, issued the order to open the dam. [Wuhan Hubei Provincial Service in Mandarin 1100 GMT 24 Dec 80 HK]

HUBEI RURAL ELECTRICITY--At present, the high and low voltage power transmission lines in the countryside throughout Hubei have been increased through the use of more transformers. Some 95 percent of the communes throughout the province and 62 percent of the brigades have electricity supply. Electricity for agricultural use has increased from 1.1 billion kilowatt-hours to 2.4 billion kilowatt-hours. The areas irrigated by electricity have also been increased. The development of electricity in the countryside has improved the conditions of agricultural production, strengthening the conditions for resisting natural disasters. This year, the peasants experienced floods in the province, but they resisted them by using electrically operated equipment. [Wuhan Hubei Provincial Service in Mandarin 1100 GMT 24 Dec 80 HK]

JIANGSU COAL MINING--Jiangsu Province has achieved initial results in readjusting its coal mining work. The annual quota of tunneling footage was met 51 days ahead of schedule. As of November, 93.2 percent of the province's coal production plan for this year had been completed. A number of coal mines have thus far prefulfilled their annual coal production quotas. [Nanjing Jiangsu Provincial Service in Mandarin 1100 GMT 6 Dec 80 OW]

JIANGSU COAL CONSERVATION--Power departments of Jiangsu Province have shut down small generating units because of their low efficiency and high coal consumption rates. This has made more coal available to larger and more efficient generating units. Since the beginning of this year, Jiangsu has shut down 19 such small generating units in 13 power plants and 6 railway power stations having a total generating capacity of 95,000 kilowatts. Thanks to this conservation measure, some 180,000 dun of coal had been saved by November this year. [OW272143 Nanjing Jiangsu Provincial Service in Mandarin 1100 GMT 22 Dec 80 OW]

JILIN COLLIERIES--Jilin provincial collieries whose products are distributed under the unified state plan prefulfilled the raw coal production plan by 5 days and overfulfilled the production plan by some 6,000 tons. They also prefulfilled the 1980 tunneling plan by 2 months. [Changchun Jilin Provincial Service in Mandarin 2200 GMT 30 Dec 80 SK]

NEI MONGGOL ELECTRICITY TRANSMISSION--A 220,000-volt electricity transmission line connecting Baotou and Hohhot municipalities was completed ahead of schedule and put into operation 27 December. The line runs 183 km. Its transformer station has a capacity of 120,000 kva. This is the largest electricity transmission project in Nei Monggol. [Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 29 Dec 80 SK]

NEI MONGGOL COAL--Producing 70 percent of the total amount of coal in Nei Monggol, the six coal mining administrations, the products of which are distributed under unified state plan, prefulfilled their 1980 raw coal production, tunneling, open-cut stripping and dressed coal production plans by 12, 68, 21 and 2 days, respectively. By the end of 1980, they tunneled 28,000 meters, 17.2 percent over their annual plan. [SK021246 Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 1 Jan 81 SK]

NEI MONGGOL POWER--In Nei Monggol, the Hohhot and Baotou power networks prefulfilled by 3 days their 1980 annual plan which called for the production of 2.92 million kWh of electric power. Power consumption in farming and light and textile industries in the region increased by 31.7 and 9 percent, respectively, over those in 1979. [SK021246 Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 1 Jan 81 SK]

SHANDONG POWER PLANTS--In the first 11 months of 1980, power plants under the Shandong Provincial Power Bureau had conserved 227,000 tons of coal, one-seventh of the total amount of coal conserved in the province. The provincial power network includes 61 power plants. In generating 100 million kWh of electricity, a set of high voltage or super high voltage generating equipment consumes 35,000 to 40,000 tons of coal, while a set of medium voltage or low voltage generating equipment consumes 68,000 to 100,000 tons of coal. Medium or low voltage generating equipment has reduced their operations in order to save coal. [Jinan Shandong Provincial Service in Mandarin 2300 GMT 23 Dec 80 SK]

SHANDONG TRANSMISSION LINE--After 1 year's construction work, a 220-kv transmission line between Weifang and Zhaoyuan counties, Shandong Province, was completed and put into operation 24 December. A comprehensive unified power network has been created in Shandong Province. [SK301150 Jinan Shandong Provincial Service in Mandarin 2300 GMT 28 Dec 80 SK]

SHANDONG COLLIERIES--Shandong provincial collieries whose products are distributed under the unified state plan had overfulfilled the 1980 state tunneling plan by 19,000 meters as of 28 December. The annual plan of tunneling 180,000 meters had been fulfilled on 27 October. [SK311052 Jinan Shandong Provincial Service in Mandarin 2300 GMT 30 Dec 80 SK]

SHANXI COAL PRODUCTION--By 25 November, all coal mines throughout Shanxi Province had produced 104 million metric tons of raw coal, fulfilling the province's production plan for 1980. [Taiyuan Shanxi Provincial Service in Mandarin 2300 GMT 15 Dec 80 HK] As of the latter part of last November, Shanxi Province had produced 104 million dun of raw coal, thus fulfilling its coal production plan for this year. The state yearly plans for the province's dressed coal output and tunneling footage were prefulfilled by 30 days and 56 days respectively ahead of schedule. The province has also carried out consolidation of local small coal mines. [Beijing Domestic Service in Mandarin 1200 GMT 21 Dec 80 OW] Taiyuan, 25 Dec (XINHUA)--Coal mines in Shanxi, whose production is under the state's unified distribution, have overfulfilled this year's coal production plan 8 days ahead of schedule and the total output has exceeded 65.6 million dun, or 5.31 percent higher than the same period last year. By 5 November, these coal mines had already fulfilled their tunneling footage plan for this year, 65 days ahead of schedule. [OW291131 Beijing XINHUA Domestic Service in Chinese 1326 GMT 25 Dec 80 OW]

SHANXI COAL INDUSTRY--Taiyuan, 2 Jan (XINHUA)--Shanxi Province, China's leading coal producer, has diverted money to the coal industry that was previously meant for metallurgical, mechanical and chemical projects, the Shanxi Economic Department said today. Coal mines now being built in Shanxi will have a total annual production capacity of 27 million tons. The new Tuanbai mine, under the Huoxian

Mining Administration, and the rebuilt and expanded Ximing mine, under the Xishan Mining Administration, have already started producing. They have a combined annual capacity of 1.2 million tons. A number of other coal mines have been expanded or rebuilt and have gone into production, adding 650,000 tons of coal a year. Seven new railway lines feeding locally run coal mines are now in use to get more of Shanxi's coal to other parts of China. [Text] [OW031315 Beijing XINHUA in English 1206 GMT 2 Jan 81 OW]

XINJIANG PETROLEUM PRODUCTION--As of 26 December 1980 the Xinjiang Petroleum Administration overfulfilled the annual state production quota for crude oil. The total output of crude oil was more than 100,000 dun over the previous high of 1979. [Urumqi Xinjiang Regional Service in Mandarin 1300 GMT 1 Jan 81 OW]

YUNNAN GEOTHERMAL SOURCES--A certain PLA capital construction corps unit has carried out preliminary investigation of the allocation of geothermal sources in the province after working hard for 5 years. The unit has discovered some 500 geothermal spots and 4 geothermal zones. In order to make full use of these hot springs and geothermal sources, this PLA unit has already submitted an investigative report to the state, and the report is now being studied by the State Energy Department. [Kunming Yunnan Provincial Service in Mandarin 1100 GMT 13 Dec 80 HK]

ZHEJIANG COUNTY SMALL POWERPLANTS--Shengxian County in Zhejiang has made headway in developing small powerplants. By the end of October 1980 the county had built 242 small powerplants with a total capacity of 22,300 kilowatts. They have generated 38 million kWh of electricity this year. [Hangzhou Zhejiang Provincial Service in Mandarin 1100 GMT 9 Dec 80 OW]

ZHEJIANG POWER OUTPUT--Zhejiang Province's electrical departments have fulfilled their annual power generation plan 2 months ahead of schedule this year. By the end of November, they had generated over 7.44 billion kWh of electricity, an increase of 42.3 percent over the corresponding period last year. From January to November, Zhejiang's power plants also conserved 109,000 dun of standard coal, which is enough to generate 265 million kWh of electricity. [Hangzhou Zhejiang Provincial Service in Mandarin 1100 GMT 26 Dec 80 OW]

UNDERGROUND HYDROELECTRIC STATION--Urumqi, 21 Dec (XINHUA)--The newest hydroelectric power station in Xinjiang Autonomous Region is in the Taklimakan Desert, built underground to offset water losses through evaporation. The turbines are propelled by melted snow from an artificially created drop of 32 meters. The water then flows on to farmland several kilometers away through underground canals. Xinjiang has many underground irrigation systems, but this was the first underground power station. The region now has 690 small and medium-sized hydroelectric stations providing power in nearly all the region's 30 counties. All are powered by melting snows and glaciers. [Beijing XINHUA in English 0715 GMT 21 Dec 80 OW]

GEOTHERMAL POWER PLANTS--Beijing, January 4 (XINHUA)--Lhasa, capital of the Tibet Autonomous Region, and surrounding areas will have more electricity when two geothermal electric generating units, each with a capacity of 3,000 kilowatts, go into operation in the first half of this year. This was reported at the Second National Symposium on Energy Sources now being held in Beijing. The Yangbajing geothermal power station, which is 90 kilometers from Lhasa, is the biggest of its kind in China. The first 1,000-kilowatt capacity generator was put up there in 1977. The exploitable reserve of the geothermal field is expected to be 150,000 kilowatts. Tibet is short of fuel and for the time being it is not possible to build large hydropower stations. Utilization of the plentiful geothermal resources in the area has been given priority in the energy program. Another geothermal power plant at Yongpo, Zhongshan County, Guangdong Province, 30 kilometers from Macao, is to be built. China has seven geothermal electric generating plants, all put up since 1970 when the first plant was built. [Text] [Beijing XINHUA in English 0701 GMT 4 Jan 81 OW]

BRIEFS

YUNNAN MINERAL DEPOSITS--Kunmin, 14 Dec (XINHUA)--Geological workers have found 27 locations in Yunnan with tin, tungsten, antimony, molybdenum, phosphorus and lead-zinc deposits. Among them, five locations appear promising for exploitation and warrant further surveys. In addition, a gypsum deposit and a fluorspar deposit, both of large size, have been discovered in the province. In the meantime, hydrogeological surveys conducted in Yiliang, Luliang and Binchuan have solved the water problem for the irrigation of some 50,000 mu of fields and for the daily needs of some 40,000 people. In Kunming Municipality, hot ground water resources have been found over an area of more than 40 square kilometers. Three wells have been sunk, all giving hot water at over 40 degrees celsius. Two of them have now been put to use. [Beijing XINHUA Domestic Service in Chinese 0258 GMT 14 Dec 80]

CSO: 4006

TEXTILE INDUSTRY REPORTS INCREASED PROFITS

OW160727 Beijing XINHUA in English 0707 GMT 16 Dec 80

[Text] Beijing, December 16 (XINHUA)--The output value of China's textile industry in 1980 is expected to be 23 percent higher than the output value for 1979, according to a national meeting of textile technicians which closed here yesterday.

Profits turned over to the state were up by 27 percent.

The meeting, at which delegates exchanged information on the latest technical developments in the textile industry, was told that technological improvements were largely responsible for the better performance.

Among the Chinese technical achievements that were cited at the meeting were rotor spinning machines, self-twisting spinning machines, and air-jet looms with multi-weft insertion and wide reed space.

China has the greatest number of self-twisting spinning machines in the world, the meeting was told. The machines' output is a dozen times higher than that of conventional ring spinning machines and they use half as much electricity and less floor space.

Other improvements include the installation of automatic drawing-in machines that free workers from hand operations; a tensionless dyeing and finishing process that makes synthetic fabrics feel like wool, computerized monitoring systems for spinning workshops, electronic jacquard-card cutters, far infrared [as received] setting machines and cobalt 60 radioactive disinfection for wool.

Conical rings for ring spinning machines that reduce broken ends and raise output have been introduced on about one million spindles throughout China.

Among the newest textiles being produced in China are: pure cotton crepe fabrics, acrylic woolly blankets, products of static flocking that have leather-like properties, profiled and compound fibres that have color changeable effects, good permeability and resilience, and double-sided plush that preserves heat well.

CSO: 4020

LIGHT INDUSTRIAL OUTPUT INCREASES IN 1980

Light, Heavy Industries Proportion

OW041216 Beijing XINHUA Domestic Service in Chinese 1159 GMT 3 Jan 81

[Excerpts] Beijing, 3 Jan (XINHUA)--With the implementation of the policy of readjusting the national economy, the proportion between light and heavy industries in the country is being improved step by step. This reporter has learned from the department concerned that our country's light industrial output in 1980 increased about 16 percent compared with 1979 while heavy industrial production rose only 2 percent. Because the growth rate for light industry was much larger than that for heavy industry, light industrial output in 1980 accounted for 46 percent of industrial output as a whole--nearly 4 percent more than in 1978, the year before the start of economic readjustment, and 3 percent more than in 1979.

Whether or not the proportion between light and heavy industries is proper is an important indication of whether or not the national economic structure is rational. During the First Five-Year Plan period, the proportion between light and heavy industries remained at 53-47. The situation at that time was better. Later due to the influence of left deviationist ideas in economic work, a disproportion between light and heavy industries began to occur in the late 1950's. By 1960 the proportion of light industry in the industrial economy as a whole had dropped to 33.3 percent. Through economic readjustment in the 1960's, this proportion rose to 50.4 percent by 1965. However, the proportion between light and heavy industries was again seriously disrupted during the 10 years of turmoil. As a result, the proportion of light industry in the industrial economy as a whole remained around 43 percent in most years from 1966 to 1978.

In accordance with the policy of readjusting, restructuring, consolidating and improving the national economy set forth by the party Central Committee, the state took a series of measures in 1979 to readjust the proportion between light and heavy industries and to accelerate the development of light industry. Thus, a new situation began to occur in the latter part of 1979. The growth rate for light industry became steadily larger than that for heavy industry. Early in 1980, the state took further measures to give "priority in six aspects" to the light and textile industries. The state provided loans totaling 2 billion yuan for the light, textile and electronics industries in 1980. Various provinces, municipalities and autonomous regions also allocated more financial resources to support light industry. They also gave priority to arranging raw materials, electric power and transportation for it. As a result, light industry developed quickly and increased the variety of good-quality and marketable products last year. The textile, light industry, electronics and medicine departments registered considerable increases in their output. The output of bicycles, sewing machines, watches, chemical fabrics, knitting wool, television sets, recorders, radio sets, cameras and pocket calculators, which are urgently needed by people in daily life, increased between 30 and 300 percent in 1980 over the output of 1979.

Output Details

OW041214 Beijing XINHUA in English 1204 GMT 4 Jan 81

[Text] Beijing, January 4 (XINHUA)--China's light industrial production in 1980 rose around 16 percent while its heavy industrial production two percent over 1979, thanks to the implementation of the policy for readjusting the national economy.

Light industry now accounts for more than 46 percent in the proportion of China's industry as a whole, up by three percent over 1979, according to industrial departments.

Last year, the state extended 2,000 million yuan in loans to light, textile and electronic industries. The local governments also provided light industries with more funds, raw materials and electricity.

Output of products in great demand, such as bicycles, sewing machines, wrist watches, chemical fibres, knitting wool, TV sets, tape recorders, radio sets, cameras and pocket electronic calculators, rose between 30 and 300 percent over the 1979 figure.

Meanwhile, heavy industrial plants also spared their technical force, factory buildings and equipment to produce light industrial products. Some of them set up economic combines with light industrial enterprises.

Metallurgical, machine-building and chemical industries turned out more and better products for light industry. Output of steel bars, wires, steel sheets, strips and welded pipes registered a 42.2 percent increase over 1979.

CSO: 4006

BRIEFS

GUANGDONG INDUSTRY--Guangdong provincial local state industrial enterprises have overfulfilled their quotas for submitting profit to the state by 3.4 percent 1 month ahead of schedule. From January to October, the province's total industrial output was increased by 9.2 percent over the same period last year. However, some enterprises in the province are still losing money and have to depend on the state to maintain production. Therefore, provincial departments concerned must pay attention to this. [Guangzhou Guangdong Provincial Service in Mandarin 1120 GMT 9 Dec 80 HK]

HEBEI LIGHT, TEXTILE INDUSTRIES--Hebei Province has quickened the pace of development of its light and textile industries through making readjustments. From January to October of this year, this province's total output value of light and textile industries increased by 16.3 percent as compared with the same period last year, thus surpassing this province's average industrial growth rate of 5.7 percent. As compared with the figures for the January to October period in 1979, the following are the percentage increases in the output of some products during that same period in 1980: The output of sewing machines increased by 69 percent, the output of bicycles increased by over 100 percent, and the output of radios increased by 150 percent. According to incomplete statistics, 78 percent of the funds raised by all prefectures and municipalities this year have been used for developing light and textile industries. [Excerpts] [Shijiazhuang Hebei Provincial Service in Mandarin 0430 GMT 8 Dec 80 HK]

HEILONGJIANG SMALL ENTERPRISES--Between January and October, the total industrial output value of commune- and brigade-run enterprises of Heilongjiang Province increased by 11.9 percent. It is expected to exceed 1.58 billion yuan by the end of 1980, a 19.7 percent increase over the 1979 figure. [Harbin Heilongjiang Provincial Service in Mandarin 1100 GMT 7 Dec 80 SK]

HEILONGJIANG INDUSTRY--Mudanjiang Prefecture, Heilongjiang Province, has prefulfilled the annual plan for industrial output value by 1 month, an increase of 7.5 percent over the corresponding 1979 period. Its 1980 industrial profits increased 61.6 percent over that of the corresponding 1979 period. The proportion of light industry increased from 37.4 percent in 1979 to 40.1 percent in 1980. Investment in light and textile industries accounted for 79.9 percent of total industrial investment. [SK291055 Harbin Heilongjiang Provincial Service in Mandarin 1100 GMT 26 Dec 80 SK]

HEILONGJIANG SECOND LIGHT INDUSTRY--Compared with 1979, in 1980 the second light industrial enterprises in Heilongjiang Province increased their output value and profits by 8.5 and 38.7 percent, respectively. [Harbin Heilongjiang Provincial Service in Mandarin 1100 GMT 1 Jan 81 SK]

HEILONGJIANG COMMUNE-RUN ENTERPRISES--In 1980 the output value of commune- and brigade-run enterprises in Heilongjiang Province was 1.58 billion yuan, showing a 19 percent increase over 1979. [Harbin Heilongjiang Provincial Service in Mandarin 2200 GMT 1 Jan 81 SK]

HENAN TEXTILE INDUSTRY--The Henan provincial textile industry has scored good results in the course of implementing the eight-character principles. From January to November, the total production value was increased by 26 percent over the same period last year, fulfilling the year's production plan 45 days ahead of schedule. The profits gained this year was increased by 42.05 percent over last year, and the average production cost was lowered by 2.56 percent. [Zhengzhou Henan Provincial Service in Mandarin 1100 GMT 24 Dec 80 HK]

HUBEI METALLURGICAL SYSTEMS--According to a HUBEI RIBAO report, Hubei Province's metallurgical systems have increased production by carrying out readjustments. In 1979 and 1980, the provincial Metallurgical Bureau has cut the level of capital construction investment by some 54 million yuan and has restructured the internal system. The province's local metallurgical systems have done well in production and have made a good profit. From January to October 1980, the total production value was increased by 15.32 percent over the value for the same period last year. Steel production was increased by 23.78 percent and profits were increased by 10 million yuan. [Wuhan Hubei Provincial Service in Mandarin 1100 GMT 11 Dec 80 HK]

JILIN INDUSTRIAL OUTPUT--Siping Municipality, Jilin Province had overfulfilled the 1980 industrial output value plan by 1.9 million yuan as of 10 December, an increase of 14.9 percent over the corresponding 1979 period. The output value of light, textile and building material industries increased 20 percent over the 1979 figure, a record for the municipal industrial front. [SK182130 Changchun Jilin Provincial Service in Mandarin 1100 GMT 17 Dec 80 SK] As of the end of November, Siping Municipality, Jilin Province, had fulfilled 98.2 percent of its 1980 industrial output value plan, an increase of 15 percent over the corresponding 1979 period. [Changchun Jilin Provincial Service in Mandarin 2200 GMT 22 Dec 80 SK]

JILIN PILOT ENTERPRISES--Pilot enterprises with expanded autonomy have increased from 30 in 1979 to 106 in Jilin Province. Between January and November, their output value and profits increased by 9.4 and 19.2 percent respectively over the corresponding 1979 period, higher than the projected growth rate of industrial enterprises. Their industrial output value is expected to reach 3 billion yuan, an 8 percent increase over last year. Their profits will reach 500 million yuan, a 15 percent increase over 1979. Some 43 million yuan will be retained by the enterprises. [Changchun Jilin Provincial Service in Mandarin 1100 GMT 29 Dec 80 SK]

JILIN INDUSTRIAL ENTERPRISES--Siping Municipality, Jilin Province, had shut down 4 industrial enterprises, amalgamated 10 and converted 6 to other trades in 1980. It had also narrowed the production scope of some 8 enterprises and decreased production on 13 products. As of November, Siping Municipality's industrial output value had met 98 percent of the annual plan, an increase of 15.4 percent over the corresponding 1979 period. The municipality's revenue increased 1.3 percent and profits 27.7 percent. Deficits decreased 43.4 percent over the corresponding 1979 period. [SK311054 Changchun Jilin Provincial Service in Mandarin 1100 GMT 30 Dec 80 SK]

JILIN LIGHT, TEXTILE INDUSTRIES--The growth rate of light and textile industries increased 10.7 percent in 1980 as against 6.7 percent in 1979. In 1980 the growth rate of heavy industry only increased 1.7 percent over that of 1979. By the end of November, light and textile industries had overfulfilled the annual profit plan by 10.4 percent. By shutting down, suspending or merging some 160 industrial enterprises, Jilin Province had saved some 180,000 tons of coal and 100 million kWh of electricity in 1980. Industrial output increased 5.2 percent. Production of radios and televisions increased from 2 to 3 times, and the output of watches, bicycles, sewing machines, clocks, sugar, woolen thread and cigarettes increased 30 percent over the 1979 figures. [Changchun Jilin Provincial Service in Mandarin 2200 GMT 30 Dec 80 SK]

JILIN PETROCHEMICAL ENTERPRISES--The total industrial output value of petrochemical enterprises throughout Jilin Province this year is 1.77 billion yuan, 4.6 percent more than in 1979. They have earned 300 million yuan profits, 3.4 percent more than the annual plan. [Changchun Jilin Provincial Service in Mandarin 1100 GMT 31 Dec 80 SK]

JILIN FIRST LIGHT INDUSTRY--Jilin Province overfulfilled its 1980 first light industrial output value plan, showing an increase of 17 percent over that of 1970. [Changchun Jilin Provincial Service in Mandarin 1100 GMT 1 Jan 81 SK]

JILIN INDUSTRY--From January to November 1980, Tonghua Municipality, Jilin Province, increased its annual industrial output value by 11.2 percent, an increase of 12.5 percent over that of the corresponding 1979 period. As of the end of November, 18 plants in the municipality were shut down, suspended, incorporated or merged with others. [SK041238 Changchun Jilin Provincial Service in Mandarin 1100 GMT 3 Jan 81 SK]

JILIN TEXTILE INDUSTRY--As of the end of November 1980, a month ahead of time, textile industrial enterprises throughout Jilin Province overfulfilled the annual output value plan by 2.5 percent, an increase of 27.7 percent over that of the corresponding 1979 period. The province's textile industrial income increased by 45.24 percent and textile industrial profits increased by 59.92 percent over that of the same 1979 period. [SK041238 Changchun Jilin Provincial Service in Mandarin 1100 GMT 3 Jan 81 SK]

LIAONING LIGHT INDUSTRY--The percentage of light industry in the total industry of Liaoning Province increased from 26.68 in 1979 to 31.5. From January to October, heavy industry of Liaoning Province increased by 3.7 percent and light industry by 27 percent as compared to the corresponding 1979 period. [Shenyang Liaoning Provincial Service in Mandarin 2200 GMT 7 Dec 80 SK]

LIAONING INDUSTRIAL INVESTMENT--Shenyang Municipality, Liaoning Province, has paid attention to readjusting industry. The municipality has invested most of its money in light, textile and electronics industrial projects and energy development projects. The municipality has completed 50 such projects; 24 have gone into production. The municipality has canceled or postponed a number of machinery and metallurgical industrial projects. [Shenyang Liaoning Provincial Service in Mandarin 1100 GMT 21 Dec 80 SK]

NEI MONGGOL INDUSTRIAL PRODUCTION--Ju Ud League in Nei Monggol region fulfilled 93.4 percent of the total industrial output value plan for 1980 by the end of November, showing an increase of 13.1 percent compared with the corresponding 1979 period. The league's light industrial output value increased by 11 percent. [Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 11 Dec 80 SK]

NEI MONGGOL INDUSTRY--Hohhot Municipality, Nei Monggol region, prefulfilled the annual industrial production plan by 23 days, a 6 percent increase over that of the corresponding 1979 period. It overfulfilled the annual industrial profit plan by 18.4 percent. In 1980 the growth rate of light and textile industries was 19 percent. The municipality saved some 25 million tons of oil, some 40,000 tons of coal and some 20 million kWh of electricity this year. [SK291048 Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 26 Dec 80 SK]

SHAANXI TEXTILE INDUSTRY--The Shaanxi provincial textile industrial front fulfilled this year's state quota for production half a month ahead of schedule. The total output value this year was 16.3 percent more than last year's. This year, the provincial textile system has laid stress on using more chemical fibers and on producing high-grade products. [Xian Shaanxi Provincial Service in Mandarin 1100 GMT 26 Dec 80 HK]

SHANDONG CONGRESS SESSION--The third session of the Eighth Jinan Municipal People's Congress convened 16-20 December in Jinan Municipality, Shandong Province. According to economic and financial reports delivered at the session, the municipality's total industrial output for the first 11 months of 1980 increased 9.9 percent over the corresponding 1979 period. The annual agricultural output value is expected to increase by 10 percent over the 1979 level. The municipality is expected to fulfill its annual revenue plan. [SK232220 Jinan Shandong Provincial Service in Mandarin 2300 GMT 22 Dec 80 SK]

SHANDONG INDUSTRIAL, COMMUNICATIONS ENTERPRISES--About 173 state-run industrial and communications enterprises which had been selected as pilot units for expanding self-management in 1979 have scored great economic results after only 1 year. During the January-October period, their average industrial output value increased 11.23 percent. Profits increased 8.7 percent over the corresponding 1979 period. [SK270701 Jinan Shandong Provincial Service in Mandarin 2300 GMT 25 Dec 80 SK]

SICHUAN MUNICIPALITY INDUSTRY--From January to November 1980, the total value of industrial output throughout Chongqing Municipality increased by 6.9 percent over the corresponding period of 1979 with the output value of the light and textile industry increased by 18 percent. The proportion of the light and textile industry in the entire industrial system has increased from 40.9 percent in 1979 to

44.9 percent in 1980. This year, 164 enterprises have been readjusted in the municipality. Up to the present, 51 projects have been suspended and postponed. Recently, the municipal government [word indistinct] the readjustments in the past year and made plans for work in the future. [Chengdu Sichuan Provincial Service in Mandarin 2300 GMT 21 Dec 80 HK]

TIANJIN COMMUNE-RUN ENTERPRISES--Tianjin, 8 Dec (XINHUA)--Nearly 500 commune- and brigade-run enterprises in Tianjin Municipality have successfully changed their orientation for production in a planned way. Instead of serving heavy industry, they have produced and processed light and textile industrial products to meet market demands. Output value of these enterprises from January to September this year increased by 17 percent, and their total income increased by 20 percent over the corresponding period of last year. [Beijing XINHUA Domestic Service in Chinese 0159 GMT 8 Dec 80 OW]

TIANJIN TEXTILE INDUSTRY--The Tianjin Municipal Textile Bureau prefulfilled the annual state production plan by 56 days. The total industrial output value increased 18 percent, profits 24.8 percent and export goods output value 35.7 percent over the 1979 figures. The varieties and quality of products also topped past records. The ratio of high-grade goods increased from 40 to 44.6 percent. The total output value increased by 170 million yuan and profits 40 million yuan. [SK281100 Tianjin City Service in Mandarin 2330 GMT 26 Dec 80]

XINJIANG LIGHT INDUSTRY--The light and textile industries in Xinjiang Autonomous Region made steady progress in the readjustment of the national economy. During the period from January to November this year, the light industry registered a growth rate of 15.3 percent, exceeding that of heavy industry. The investment funds allocated for light and textile industries in the region this year increased by 6.89 percent compared with last year. A number of heavy industry enterprises in this region have been closed or reorganized to make way for the light and textile industries. The various light and textile enterprises have increased their power in managing their affairs and raised productivity this year. Many of them have turned from suffering a loss to making a profit. [Urumqi Xinjiang Regional Service in Mandarin 1300 GMT 17 Dec 80 OW]

XINJIANG RECLAMATION INDUSTRIES--A forum on industries in Xinjiang region's reclamation farms ended on 9 December. It was pointed out at the forum that since 1980, industrial departments of Xinjiang's reclamation farms have closed down, stopped the production of or merged a number of enterprises that either lacked sources of raw and other materials or could not find markets for their products. Xie Gaozhong, vice chairman of the Xinjiang regional people's government and director of the regional General Administration of Reclamation, spoke at the forum. [Urumqi Xinjiang Regional Service in Mandarin 1300 GMT 3 Jan 81 OW]

BUILDING MATERIALS INDUSTRY--Beijing, December 20 (XINHUA)--China's building materials industry has fulfilled 1980 production quotas ahead of schedule for 14 major building materials and non-metallic mineral products, including cement, glass fibre, graphite and gypsum, the Building Materials Ministry announced today. By the end of November, China had turned out 74.6 million tons of cement, 12 percent above the annual target and 13 percent more than in the same period of 1979. So far this year, the ministry said, the output of plate glass, ceramics and terrazzo was up by more than 10 percent over the corresponding period of 1979, while output of glazed tiles and enamelled bricks chalked up a 40 percent increase or more. In addition, the output of plasterboards, aerated concrete and other new building materials in the first 10 months of this year exceeded that of 1979. Statistics for China's major cement works showed that, from January to November, 99.99 percent of the cement produced met the quality control standards, 0.02 percent more than in the same period of 1979. First-grade plate glass rose by 5.6 percent. The production of clinker cement consumed 1.81 kilograms less coal per ton compared with the same period of 1979 and glass production used 1.44 kilograms less coal per "weight" case measuring ten square meters and two millimeters thick. [Text] [OW200232 Beijing XINHUA in English 0218 GMT 20 Dec 80]

SHANGHAI TEXTILE PRODUCTION--Shanghai, January 5 (XINHUA)--The value of Shanghai's textile output for 1980 was 13,100 million yuan, 11.7 percent more than in 1979, the Shanghai Municipal Textile Industry Bureau reported today. The city's textile mills turned over to the state profits of 2,770 million yuan, 15.6 percent more than in 1979, and taxes exceeding 1,230 million yuan. The total handed over to the state, 4,000 million yuan, was 500 million yuan more than in 1979. Achievements were also made in technical innovation over the past year, and 27 experimental workshops and production lines went into operation. Shanghai's textile industry added more than 10,000 new varieties and designs in 1979, and output of polyester and viscose mixed fibres and chemical fibre knitwear outer garments rose by 38.9 and 21.5 percent respectively over the 1979 figure. About 3,500 quality control teams were set up in the textile industry to ensure continuous improvement of quality of products. Shanghai's mills also saved a total of 110 million kilowatt-hours of electricity and 65,000 tons of coal through energy conservation measures, while production costs were cut by one percent. [Text] [OW050812 Beijing XINHUA in English 0802 GMT 5 Jan 81]

GANSU ENTERPRISES--With the approval of the Gansu Provincial Party Committee, party organizations of enterprises and establishments in Lanzhou Municipality which were under the direct control of the Party Central Committee or the Provincial Party Committee have been placed under the jurisdiction of the Lanzhou Municipal Party Committee. This transaction was completed between mid-September and early December. The 74 enterprises and establishments include the Lanzhou Chemical Company, the Lanzhou Oil Refinery, the Eighth Metallurgical and Construction Company, the Lanzhou Petrochemical Machinery Plant and the Lanzhou General Machinery Plant. Effective 1 January 1981, the Lanzhou Municipal Party Committee will exercise leadership over ideological and political work, party building and production in these units. [SK212247 Lanzhou Gansu Provincial Service in Mandarin 1125 GMT 20 Dec 80]

JILIN ELECTRONICS ENTERPRISES--Electronics enterprises in Jilin Province have shifted their attention to producing products for civilian use in line with the policy of economic readjustment. So far, over 60 percent of the province's electronics enterprises have begun producing products for civilian use. As of the end of November, the annual output value of the province's electronics enterprises had been fulfilled by 126.4 percent, an increase of 63 percent over the corresponding 1979 period. [SK200556 Changchun Jilin Provincial Service in Mandarin 2200 GMT 17 Dec 80]

SYNTHETIC FIBER CONFERENCE--Shanghai, Dec 17 (XINHUA)--China is expected to produce 420,000 tons of synthetic fiber by the end of this year, with which three meters of cloth may be woven for every member of the Chinese population. This compares to 320,000 tons in 1979 and 287,000 tons the year before. This was disclosed at a national meeting on the production of synthetic fiber which ended in Shanghai last Sunday. There are more than 140 plants of synthetic fiber throughout China. Participants in the meeting pledged to work still harder in 1981 to improve the quality and increase the variety of the products, while reducing the consumption of energy and material. [Text] [OW170710 Beijing XINHUA in English 0701 GMT 17 Dec 80]

HUNAN RADIO PRODUCTION--Hunan Province has increased radio production this year. From January to October, the province produced some 430,000 radio sets, overfulfilling the year's production plan 2 months ahead of schedule and showing an increase of 270 percent over last year's average total production. It is estimated that the total production of radio sets this year will amount to 540,000, representing 80 percent of the total production over the past 10 years. [Changsha Hunan Provincial Service in Mandarin 2315 GMT 30 Nov 80]

SHANGHAI INTEGRATED PLANTS--By late November, 20 joint operated factories were established by the Shanghai Municipal Bureau of Textile Industry through cooperation with the communes and towns in suburban areas, and 6 have been put into operation and 14 others are under construction. When completed in the next 1 or 2 years, they will have a total output value reaching 220 million yuan annually and profits will amount to 33.45 million yuan. When all 20 jointly operated plants are in full operation, jobs can be provided for 3,800 unemployed youth in the Shanghai urban area. [Shanghai City Service in Mandarin 2300 GMT 4 Dec 80]

QUALITY CONTROL ASSOCIATION--Beijing, 13 Dec (XINHUA)--China Quality Control Association held its first annual conference in Beijing 5-12 December. The conference summed up the experience in the past year in all-round quality control and the dissemination of related knowledge. Since the beginning of this year, more than 4,400 enterprises throughout China have experimented with all-round quality control. The annual conference published 27 theses which scientifically summed up the actual conditions in China's all-round quality control and made theoretical explorations. The conference pointed out three existing problems: 1. Some units and departments have yet to foster the idea of "quality first"; 2. quality control organs are not sound, a powerful leadership is lacking; 3. the policy of encouraging enterprises to improve quality and develop new products has not been implemented. [Beijing XINHUA Domestic Service in Chinese 1248 GMT 13 Dec 80]

INSURANCE COMPANIES--Beijing, 28 Dec (XINHUA)--The China People's Insurance Company has set up over 160 branches throughout the country, and insured property is estimated at more than 100 billion yuan. The Dalian No. 7 Petroleum Plant caught fire on 3 August 1980 and the insurance company made an investigation the same day and paid the plant over 500,000 yuan. The plant restored production in about 2 weeks. The Jilin Municipal Woolen Textile Mill, which repeatedly refused to buy insurance, also caught fire on 6 August 1980, sustained a loss of 1.58 million yuan, and has not yet been restored to production. HEBEI URGES REDUCING SCALE OF CAPITAL CONSTRUCTION

HK181222 Shijiazhuang Hebei Provincial Service in Mandarin 0430 GMT 8 Dec 80

[Report on contributing commentator's article: "Resolutely Implement the Eight-Character Policy and Continue To Reduce the Scale of Capital Construction"]

[Excerpts] The article said: For a long time past, due to the lack of guidance in the field of macroeconomics for this province's capital construction work and due to the mistakes of neglecting objective conditions and of blindly launching large-scale projects, we have been unable to complete some projects that have been under construction for many years, thus fighting a "war of attrition" over a long period of time. We have drawn profound lessons from this. Although this year's direct state investment in this province's capital construction has been reduced to less than 1.2 billion yuan, the total capital construction funds raised by all prefectures, municipalities and departments still amount to over 1 billion yuan. These two types of funds add up to over 2.9 billion yuan. Moreover, the actual implementation of this province's capital construction plans will require much more money. This shows that the general scale of capital construction in this province is still very large and that reducing this general scale is still a very difficult task.

Why is it that this province has failed to reduce the scale of capital construction? An important reason for the failure is that this province has failed to successfully control unplanned capital construction projects which are on an excessively large scale.

How are we to control and reduce the scale of capital construction in this province? At present, we must attach major importance to solving the problem of redundant construction, the problem of blind construction and the problem of "small ones squeezing out large ones."

To reduce the scale of capital construction, we must continue to do well in clearing up projects currently under construction. According to statistics completed by departments concerned, there are more than 1,910 local projects that are still under construction this year. Each of these local projects needs an investment of 50,000 yuan or more. These investments add up to over 1.28 billion yuan. Judging from this year's investment level, these local projects currently under construction will take us several years to finish even if we do not launch any new projects. Judging from this province's current financial and material resources, these local projects currently under construction are heavy burdens. Therefore, we must pay close attention to clearing up all projects currently under construction. The provincial CCP committee and the provincial people's government have attached major importance to clearing up all projects currently under construction. They have called on all areas and departments to adopt effective measures to solve problems caused by the overextended capital construction line. They have called for resolutely suspending all construction projects that should be suspended in order to concentrate manpower and financial and material resources to promote as quickly as possible those projects that are regarded as weak links in the national economy, to smoothly carry out the work in readjusting the national economy and to score still greater achievements in readjusting the national economy.

CSO: 4006

CONSTRUCTION

BRIEFS

MACHINE BUILDING MINISTRY--The First Ministry of Machine Building has achieved good results in training cadres of various units under its jurisdiction. During the past 3 years, it has held 36 terms of training classes for directors of various plants with a total attendance of more than 1,700 cadres. In addition, the ministry has held various professional training classes and trained more than 6,000 professional cadres. About half of the directors of plants and nearly 400,000 professional cadres have been trained by machine building departments in various provinces, municipalities and autonomous regions during that period. Stress is laid on combining theory with practice and scientific management in the training. [Beijing Domestic Service in Mandarin 1200 GMT 17 Dec 80 OW]

BUILDING STONE-CARVINGS CORPORATION--Jinan, 3 Jan (XINHUA)--The China Building Stone-Carvings Corporation, which will provide Chinese and foreign customers with stone building materials from Tai'an County, Shandong Province, east China, has just been inaugurated. It has business offices in Beijing, Shanghai, Tianjin, Shenyang, Xian, Wuhan, Chengdu and Jinan. The corporation produces stone decorative materials and carvings and it will also provide materials and masons to repair cultural relics and sites of historic interest in China and overseas. Tai'an County is one of China's major sources of building stones. It abounds in granite of many colors. The county processes 100,000 to 200,000 cubic meters of stone building materials a year. [Text] [Beijing XINHUA in English 1215 GMT 3 Jan 81 OW]

URBAN HOUSING CONSTRUCTION--Beijing, 30 Dec (XINHUA)--By the end of November 1980, houses with a total area of over 40 million square meters had been built in various urban, industrial and mining areas throughout China, a 39 percent increase over the same period in 1979. According to the department in charge, various cities throughout the country had concentrated efforts in housing construction since the start of December in order to surpass the 1979 record, the highest since the founding of the People's Republic. Urban housing completed in 1979 reached over 60 million square meters of floor space. While making readjustments in capital construction, various localities and departments had strengthened urban housing construction and paid attention to arousing enthusiasm in housing construction by the state, localities, enterprises and individuals. Many enterprises stepped up housing construction by raising their own funds. [Beijing XINHUA Domestic Service in Chinese 0737 GMT 30 Dec 80 OW]

ANHUI CAPITAL CONSTRUCTION--Acting in accordance with a directive issued by the State Council, certain numbers of capital construction projects have been suspended in various localities of Anhui Province. The suspended projects include the construction of an auxiliary line on the Huainan railway and some 50,000 square meters of buildings in Hefei, Anqing, Luan and other cities. Arrangements are being made to make full use of the workers from the suspended projects to build more schools, workers' housing and water conservancy projects. [Hefei Anhui Provincial Service in Mandarin 1100 GMT 10 Dec 80 OW]

FUJIAN CAPITAL CONSTRUCTION--Last year, Fujian Province suspended 63 capital construction projects and reduced its investment by 300 million yuan. Since minor projects were eliminated, manpower, financial and material resources have been concentrated to a greater extent on major projects. From January to October this year, the province fulfilled 620 million yuan of capital construction investment, representing 92.7 percent of the year's plan and showing an increase of 20.6 percent over the corresponding period last year. Completed housing construction projects were increased by 49.2 percent over the same period last year, and completed residential construction projects increased by 65.9 percent. University capital construction was increased by 350 percent over last year. [Fuzhou Fujian Provincial Service in Mandarin 1035 GMT 1 Dec 80 HK]

GUANGDONG CAPITAL CONSTRUCTION--The Guangdong Provincial Construction Committee ran a study course recently for leading cadres of the capital construction front. The course called on leaders at all levels and departments concerned throughout the province to strengthen investigation and study and to avoid building duplicate facilities. The course also looked into the theory on the socialist economic law and into the basic knowledge of the administration of capital construction. The course urged the province to solve the old problem of having too many construction projects. [HK121510 Guangzhou Guangdong Provincial Service in Mandarin 2345 GMT 29 Nov 80 HK]

GUANGDONG CONSTRUCTION REDUCTION--The Guangdong Construction Bank has thoroughly examined projects under construction. In 1979, the bank suspended and postponed construction of 43 projects. This year, the bank has suspended and postponed construction of another 74 projects, reducing investment by 600 million yuan. In the past, the capital construction front in the province was too extended and the funds were not centralized, causing large-scale losses. [HK290946 Guangzhou Guangdong Provincial Service in Mandarin 1120 GMT 25 Dec 80 HK]

GUANGDONG CAPITAL CONSTRUCTION CUTS--The Guangdong provincial people's government recently demanded that all areas take stock of capital construction projects and cut capital construction expenditure. The province has been working in accordance with the readjustment principles during the past 2 years and has suspended and delayed some 400 capital construction projects. The province has saved 900 million yuan of capital construction investment. However, the province's capital construction front is still overextended. In light of this, the provincial people's government has decided to reduce the scale of the capital construction front. In order to improve people's living conditions, the provincial people's government has decided that no construction unit will be allowed to buy materials and equipment for any construction project unless the projects involves workers' hostels or residential construction. [HK010223 Guangzhou Guangdong Provincial Service in Mandarin 2345 GMT 23 Dec 80 HK]

GUANGDONG HOUSING CONSTRUCTION--In 1980, the people in Guangdong constructed 3.8 million square meters of residential houses for the staff and workers in the province. The banking circles have also actively supported the construction of these houses by providing funds. According to preliminary statistics, 300,000 square meters of residential housing areas were built with funds from abroad. Some 400,000 square meters of housing areas were built for private use throughout the province. [HK300321 Guangzhou Guangdong Provincial Service in Mandarin 2345 GMT 20 Dec 80 HK]

GUIZHOU CAPITAL CONSTRUCTION--In the course of economic readjustments in 1979 and 1980, Guizhou Province has reduced the scale of local capital construction. The province has suspended and delayed 105 local capital construction projects, reducing its investment by 326.7 million yuan. [HK300322 Guiyang Guizhou Provincial Service in Mandarin 2315 GMT 22 Dec 80 HK]

HEILONGJIANG CAPITAL CONSTRUCTION INVESTMENTS--The Heilongjiang Provincial Construction Bank held a meeting 7 December to discuss ways to control capital construction expenditures. Although the state-assigned capital construction investments for our province is 21 percent lower than in 1979, capital construction projects built with bank loans or locally raised funds have greatly increased. The meeting decided that the unallotted investments in the projects to be built should be frozen, investments in office buildings, organizational dining rooms, guest houses or hotels under construction should be suspended and be examined to see if they should be continued. Investments in projects without sufficient raw material and fuel supply or projects with unsolved technical problems and duplicate projects should be stopped and investments in projects to be initiated next year should not be allocated in advance this year. [Harbin Heilongjiang Provincial Service in Mandarin 2200 GMT 12 Dec 80 SK]

HEILONGJIANG HOUSING CONSTRUCTION--According to statistics compiled by departments concerned, Harbin Municipality, Heilongjiang Province, had invested some 420 million yuan in housing construction by the end of November. Some 220 million yuan was raised by various enterprises, 52.9 percent of the municipality's housing investment. By the end of November housing areas under construction totaled 2.36 million square meters in floor space. Residential housing with a floor space of some 555,000 square meters have been completed. This constitutes 92.5 percent of the 1980 municipal construction plan. [SK182130 Harbin Heilongjiang Provincial Service in Mandarin 1100 GMT 17 Dec 80 SK]

HUBEI CIRCULAR ON HOUSING--The Hubei Provincial Urban Construction Bureau issued an urgent circular on 26 November demanding that all places take effective action to speed up urban housing construction. The circular noted that although the province's urban housing construction this year has been done faster than in any previous year, the work still lags far behind the demands of the year's plan. It must therefore be speeded up. Preparations for next year's work must also be organized. [Wuhan Hubei Provincial Service in Mandarin 1100 GMT 30 Nov 80 HK]

HUBEI CONSTRUCTION--Recently, the Hubei Provincial CCP Committee and the provincial people's government decided to suspend the building of a number of small factories and to concentrate financial and material resources and construction forces on speeding up the building of key plants and on residential construction.

Over the past 2 years, the province has suspended 358 projects and cut 1.23 billion yuan of capital investment. However, the capital construction front is still overextended, and problems of blind and duplicate construction of factories are prominent. Thus, the provincial CCP committee and the provincial people's government decided to carry out readjustment and reduce the number of capital construction projects. [HK200616 Wuhan Hubei Provincial Service in Mandarin 1100 GMT 4 Dec 80 HK]

HUNAN CAPITAL CONSTRUCTION--According to a HUNAN RIBAO report, Hunan Province eliminated certain capital construction investments. According to statistics, from January 1979 to October 1980, the province suspended and halted 226 capital construction projects which required an investment of more than 50,000 yuan, and eliminated 860 million yuan of incomplete investment projects. On the other hand, development of light and textile industries, electricity, construction material, transportation and residential construction has been speeded up. However, there is still a lot of repetitious and blind construction. We must still work harder to decrease the scale of capital construction. [Changsha Hunan Provincial Service in Mandarin 2315 GMT 2 Dec 80 HK]

HUNAN HOUSING CONSTRUCTION MEETING--A Hunan provincial conference on rural housing construction was recently held. Provincial Vice Governor Cao Wenju attended and spoke. He said: Governments at all levels should pay attention to peasants' living conditions. Currently, most of the peasants are living in satisfactory conditions, however, some of them are still living in very poor conditions. Governments at all levels must strengthen leadership over rural housing construction. At present, an inadequate supply of construction materials has become an obstruction to rural housing construction, thus all areas should develop commune and brigade construction materials enterprises. [Changsha Hunan Provincial Service in Mandarin 1100 GMT 5 Dec 80 HK]

JIANGSU CONSTRUCTION PROJECTS--Suzhou Municipality in Jiangsu has decided to cancel, suspend and defer 54 capital construction projects with a total floor space of some 160,000 square meters and a total investment of over 20 million yuan. The projects to be curtailed include guest houses, memorial halls, projects for which construction materials have not yet been assured, plants whose goods are unsalable and production should not be expanded, projects which will take a long time to build and for which construction preparations are incomplete, and repetitious projects that can be dispensed with. After suspension of these projects, manpower and financial and material resources will be concentrated on the construction of living quarters and educational facilities in Suzhou. [Nanjing Jiangsu Provincial Service in Mandarin 1100 GMT 25 Dec 80 OW]

JIANGSU REPETITIOUS PROJECTS--The recently concluded Jiangsu provincial conference on urban planning pointed out that it is urgent to curtail Jiangsu's capital construction as there are numerous repetitious projects funded by nonbudgetary investments. This year Jiangsu has halted and deferred 43 capital construction projects and cut expenses by 400 million yuan; but there are still 840 million yuan of nonbudgetary projects sponsored by various localities with bank loans. The conference pointed out that, while many machinery plants in Jiangsu are not operating at full capacity, construction of 21 additional machinery plants is busily underway. They add that while Jiangsu needs only 80,000 dun of calcium carbide annually, the output capacity had already reached 240,000 dun by the end of 1978, and that because of unrealistic construction, over 40 plants in Jiangsu are idle or half-idle. [Nanjing Jiangsu Provincial Service in Mandarin 1100 GMT 26 Dec 80 OW]

JILIN CAPITAL CONSTRUCTION PROJECTS--In order to reduce expenditures on the capital construction front, the Jilin municipal people's government recently decided to cancel 18 capital construction projects and to suspend 14 others this year. These include 7 state projects, 17 municipal projects and 6 projects dependent on bank financing. Some 10 million yuan will thus be saved. Some 99 key projects are expected to be completed by the end of December. [Changchun Jilin Provincial Service in Mandarin 1100 GMT 17 Dec 80 SK]

LIAONING CAPITAL CONSTRUCTION--Dandong Municipality decided to stop some 30 capital construction projects and dissolve or merge some enterprises. This will result in saving about 8.4 million yuan in funds and in sparing about 74,000 square meters in land. [Shenyang Liaoning Provincial Service in Mandarin 2200 GMT 8 Dec 80 SK]

LIAONING HOUSING--During the January-October period, Liaoning Province completed construction on private housing with a floor space of some 175,000 square meters. [Shenyang Liaoning Provincial Service in Mandarin 2200 GMT 17 Dec 80 SK] According to initial statistics, houses totaling some 9.8 million square maters in floor space were under construction in Liaoning Province in 1980. [Shenyang Liaoning Provincial Service in Mandarin 2200 GMT 2 Jan 81 SK]

NEI MONGGOL WORKERS COLLEGES--Hohhot, 4 Dec (XINHUA)--The Nei Monggol Autonomous Regional People's Government recently approved building of 5 workers colleges. The colleges are respectively run by the Baotou Iron and Steel Company, the Baotou Municipal Machinery Bureau, the Baotou Steel Construction Company, the Hohhot Municipal Trade Union Council and the Uda Mining Bureau. These colleges enroll staff and workers of the factories and mining enterprises of various nationalities. [OW050159 Beijing XINHUA Domestic Service in Chinese 0144 GMT 4 Dec 80 OW]

NEI MONGGOL CONSTRUCTION FRONT--Nei Monggol regional construction departments had prefulfilled the annual production plan by 1 month. The construction projects completed totaled 170 million yuan, surpassing the annual plan by 12.68 percent. Total profits earned during the year were more than 7 million yuan. [SK171648 Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 16 Dec 80 SK]

QINGHAI CAPITAL CONSTRUCTION--The Qinghai provincial people's government has resolutely implemented the guidelines of relevant documents issued by the State Council and exerted vigorous efforts to cut back on the capital construction front. In 1980 the province canceled or postponed 46 capital construction projects and reduced investments 360 million yuan. [SK040347 Xining Qinghai Provincial Service in Mandarin 2330 GMT 2 Jan 81 SK]

SHAANXI CAPITAL CONSTRUCTION PROBLEMS--The Shaanxi provincial capital construction front has carried out blind and duplicate construction. The situation is very serious. Counties and municipalities in some prefectures lack an overall point of view. It is suggested that local advantages should be brought into play. As small wineries, cigarette factories, cutting tool factories and oil plants, which have been quickly set up one after another, have competed with large state factories for raw materials and adversely affected the latter's production and the national economy, their number should be reduced to enable the large state factories to develop successfully. Moreover, small factories have been poorly managed and incurred serious waste. Their taxable rate is different from large factories, resulting in a reduction in state revenue. What is worse, they have privately copied others' trademarks and created chaos in the market. It is hoped that the leadership departments concerned will make unified arrangements for the development of the commune and brigade enterprises and give guidance in a planned way for the procurement of raw materials, production and sales. [HK200724 Xian Shaanxi Provincial Service in Mandarin 1100 GMT 4 Dec 80]

SHAANXI RURAL HOUSING CONFERENCE--The Shaanxi provincial government recently held a meeting on rural housing construction. The meeting held: It is necessary to grasp rural housing construction and the following tasks: 1) Devise an overall planning scheme; 2) act in light of local conditions to solve construction material problems; 3) adopt flexible measures; 4) strengthen leadership and strengthen trial work to promote rural housing construction. [Xian Shaanxi Provincial Service in Mandarin 2300 GMT 26 Dec 80 HK]

SHANDONG CONSTRUCTION--Effective 1 December, Shandong Province began another inspection of ongoing capital construction projects. By 22 December construction on another 72 office buildings, auditoriums and guest houses with a total floor space of 227,700 square meters had been stopped. [Jinan Shandong Provincial Service in Mandarin 2300 GMT 27 Dec 80 SK]

SHANDONG NEW HOUSES--In 1980 some 3 million peasant households in Shandong Province built new houses, accounting for 20 percent of the total peasant households. Some 30 percent of the peasant households in Qingdao Municipality and Yantai and Linyi prefectures moved into new houses. [SK051413 Jinan Shandong Provincial Service in Mandarin 2300 GMT 4 Jan 81 SK]

CHONGQING CABLE RAILWAY--Chengdu, 16 Dec (XINHUA)--Construction started yesterday on China's first passenger cable railway across the Jialing River, in Chongqing City, Sichuan Province, southwest China. The project is due to be completed by the end of 1981 and will carry 600.700 [as received] passengers an hour in a cable car with a capacity of 45 persons per trip. The cableway will be 737 meters long and will run from Cangbai Road, near the river front area of downtown Chongqing, across the Jialing to Jinsha Road on the north bank. [Text] [Beijing XINHUA in English 0142 GMT 13 Dec 80 OW]

WUHAN MUNICIPAL CIRCULAR--The Wuhan municipal people's government issued a circular on 19 December, demanding that all units carry out large-scale inspections on the number of capital construction projects, commodity prices, storage of materials and indiscriminate lumbering. [Wuhan Hubei Provincial Service in Mandarin 1100 GMT 23 Dec 80 HK]

ZHEJIANG URBAN PLANNING MEETING--A Zhejiang provincial meeting on urban planning, construction and environmental protection was recently held in Hangzhou. The meeting called on all localities to formulate appropriate plans for urban construction and environmental protection, control the size of large cities, develop medium-sized cities in a rational way and vigorously build small cities. The meeting encouraged enterprises and departments to self-finance building of living quarters for their workers and staff. The meeting also encouraged individuals to buy and build living quarters of their own. [Hangzhou Zhejiang Provincial Service in Mandarin 0400 GMT 28 Dec 80 OW]

BEIJING APARTMENT CONSTRUCTION--Beijing, 12 Dec (XINHUA)--Beijing Municipal Statistics Bureau said today that the city has built more than 42,000 apartments so far this year. The bureau said this is about 16,300 more than were built up to the end of November last year and the city expects to complete a total of 60,000 by the end of 1980. Work is underway on a total of 101,800 apartments. From the beginning of this year, Beijing has slashed back on industrial projects worth more than 1 million yuan and has poured 59 percent of "mobile" city funds into housing construction. About 68 percent of the buildings erected in the capital in the first 11 months of this year were residential. Of these, 20 percent are on estates with schools, kindergartens, shops and other service facilities. [Text] [OW172341 Beijing XINHUA in English 1218 GMT 12 Dec 80 OW]

BRIEFS

ANHUI PRICE CONTROL CIRCULAR--The Anhui Provincial Commerce Department recently issued a circular calling on all-level commercial administrative units to resolutely implement the instructions of the State Council and the provincial people's government on strictly controlling prices and readjusting negotiated prices, immediately organize forces to conduct a general inspection of prices and lower unreasonably high prices, and strive to do a better job in the supply of commercial goods. Retail prices above the state listed prices must be lowered. Certain commodities must not be sold at negotiated prices, but prices fixed by the state. Speculation, profiteering and other illegal selling and buying activities must be stopped. [OW290955 Hefei Anhui Provincial Service in Mandarin 1100 GMT 24 Dec 80 OW]

ANHUI COMMERCIAL WORK--The state-run commercial units in Anhui Province made significant achievements in 1980. The total value of commodities procured by various state-run commercial units during 1980 is 5.7 percent greater than that of 1979, and the total value of commodities sold is 17 percent greater than that of 1979. Total profits turned to state treasury by those units as of the end of November 1980 already fulfilled the annual quota. During 1980 more than 500 state-run commercial networks or units were set up in 8 municipalities and more than 33,000 individual industrial and commercial enterprises and stores were restored or set up in the province. The total value of commercial products sold to the people during 1980 is over 2.8 billion yuan, representing a 17 percent increase over the previous year. The varieties of agricultural sideline products in the markets have increased, but the average price has decreased by 1.62 percent. [Hefei Anhui Provincial Service in Mandarin 1100 GMT 31 Dec 80 OW]

BEIJING PRICE REGULATION--Beijing, 16 Dec (XINHUA)--The Beijing municipal people's government today issued a tentative regulation on the kinds of farm and sideline products which can be sold and bought at negotiated prices and the principle of pricing for these products. According to the regulation, pigs, cattle, sheep, domestic rabbits, pork, beef, mutton, rabbit meat, eggs, duck eggs, chickens and ducks are to be sold at prices already fixed by the state, while other varieties of meat, eggs and poultry are to be sold at negotiated prices. The regulation points out that in negotiating the purchase and selling prices, the negotiated prices should generally be lower than the local market price, and that the negotiated prices should be in line with the principle of making smaller profits for quicker turnover. [OW220135 Beijing XINHUA Domestic Service in Chinese 1600 GMT 16 Dec 80 OW]

GUIZHOU PRICE CONTROL--According to a Guizhou station commentary, some areas in the province have been increasing commodity prices on their own accord. The commentary urged the departments concerned to attach importance to this. The commentary said: It is necessary to do a good job of controlling prices in accordance with the State Council's circular in order to maintain a stable livelihood for people. We must strictly forbid units from raising commodity prices on their own accord. [HK231309 Guiyang Guizhou Provincial Service in Mandarin 2315 GMT 1 Dec 80 HK]

HEBEI PRICE CONTROL--The Hebei provincial people's government issued a circular on 9 December, demanding that all areas seriously implement the State Council's circular on price control. The circular said: All departments concerned throughout the province must organize cadres and the masses to understand the importance of price control. All departments concerned should also carry out inspection to insure that commodity prices are not raised subtly. The circular also pointed out: The provincial people's government will soon publish regulations concerning the sale and purchase of commodities at negotiated prices, and will organize large-scale inspection to insure that commodities are sold in accordance with the regulations. [HK200706 Shijiazhuang Hebei Provincial Service in Mandarin 0430 GMT 10 Dec 80 HK]

HEILONGJIANG PRICE CIRCULAR--The Heilongjiang provincial people's government issued a circular on 26 December. The circular states: Means of production under state control, manufactured goods under the first and second categories, major industrial raw materials and farm products and manufactured goods impinging on the people's daily life cannot be sold at negotiated prices. The prices of manufactured goods under the third category should be set by industrial and commercial enterprises. The ceiling for negotiated prices of grain and oil-bearing seeds is 150 percent of present prices. The retail prices of vegetables should be frozen at the 1980 level. The ceiling prices of other farm products and manufactured goods should be set at the levels obtaining on or before 7 December 1980. The circular also sets forth regulations on seasonal variations in price. [SK310718 Harbin Heilongjiang Provincial Service in Mandarin 1100 GMT 26 Dec 80 SK]

HUNAN PRICE CONTROL CONFERENCE--The Hunan provincial people's government held a telephone conference on 15 December, urging the entire province to implement the State Council's circular on price controls. Liu Fusheng, secretary of the provincial CCP committee and vice governor, presided over the conference, and Shang Zijin, vice governor, spoke at the conference. He said: All areas must attach importance to price control work and should work in accordance with four proposals. Leaders at all levels must: 1) Take the lead in implementing the State Council's circular; 2) immediately launch commodity price inspections; 3) seriously rectify prices of commodities which are sold at negotiated prices; 4) closely link stable commodity prices with market regulation, insuring that state-allocated materials are not sold at negotiated prices and that the supply of products is adequate during the spring festival. [HK251350 Changsha Hunan Provincial Service in Mandarin 2315 GMT 16 Dec 80 HK]

JIANGXI PRICE CONTROL CIRCULAR--The Jiangxi provincial people's government issued a circular on 12 December on price control. The circular read as follows: All administrative offices, people's governments at all levels in municipalities and counties and all units must strive to stabilize commodity prices. It is necessary to: 1) Sell all products, either retail or wholesale, at fixed state prices; 2) stop all kinds of deception; 3) seriously rectify sale and purchase by negotiation; 4) implement the policy of not selling category No 2 industrial products at negotiated prices; 5) state-allocated materials must be supplied at fixed prices; 6) market prices must be marked complying with local unified prices; 7) stabilize prices of vegetables in the municipalities; 8) strengthen market management and strike at all speculative activities; 9) launch inspections over commodity prices. [Nanchang Jiangxi Provincial Service in Mandarin 1100 GMT 13 Dec 80 HK]

JIANGXI PRICE INSPECTION GROUP--In order to seriously implement the State Council's circular on price control, the Jiangxi provincial people's government has set up a price inspection group to carry out market price inspections in Yichun, Ganzhou and Fuzhou prefectures. The inspection group was led by provincial Vice Governor Wang Shixian. The inspection group consisted of 122 members and was divided into 16 inspection teams. [Nanchang Jiangxi Provincial Service in Mandarin 1100 GMT 13 Dec 80 HK]

NEI MONGGOL SALES EXHIBITION--The first Nei Monggol regional sales exhibition of products produced by commune and brigade-run enterprises closed on 15 December. The retail sales totaled some 70,000 yuan and the volume of business was nearly 7 million yuan. During the exhibition, a forum was held which was attended by some 500 persons, including responsible persons from various leagues, municipalities, banners and counties and responsible persons of key regional commune and brigade-run enterprises. A work plan for 1981 was formulated at the forum. Regional leading comrades, including Wang Duo, Shi Guanghua and Chen Binyu, toured the sales exhibition and gave speeches on ways to steadily develop the commune and brigade-run enterprises in the region. [SK161410 Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 15 Dec 80 SK]

SHAANXI PRICE CONTROLS--The Shaanxi provincial people's government issued a circular on 6 December urging the implementation of price controls. The circular included eight stipulations: 1) Commodities must be sold complying with the state's fixed retail and wholesale prices; 2) negotiated price commodities must be sold in accordance with the stipulations published on 7 February 1980; 3) products produced in excess of the state's production quota must be sold according to state fixed prices and not at negotiated prices; 4) catering, repair and services trades must charge people in accordance with state fixed rates; 5) vegetable prices must be stabilized and no units are allowed to purchase vegetables directly in the communes and brigades; 6) county people's governments can stipulate prices of other necessary everyday products in light of local conditions; 7) enterprises must be supervised under the state's policies; 8) it is necessary to strengthen management over markets and strike out at all speculative activities. [HK231340 Xian Shaanxi Provincial Service in Mandarin 2300 GMT 12 Dec 80 HK]

SICHUAN BLACK MARKETS--According to CHENGDU RIBAO report, on the evening of 9 December, Chengdu policemen and responsible comrades of the municipal industrial and commercial administration bureau conducted a joint operation to crack down on black markets. They arrested 67 suspects and seized a large amount of goods. [Chengdu Sichuan Provincial Service in Mandarin 2300 GMT 12 Dec 80 HK]

ILLEGAL HAWKING IN CHENGDU--According to a SICHUAN RIBAO reporter's letter, illegal hawking has been discovered recently in Chengdu Municipality. These hawkers caused traffic congestion and disturbed social order. Most of the products were speculative products sold under the pretext of purchasing and selling at negotiated prices. The letter urged departments concerned in the province to adopt effective measures to stop these activities. [Chengdu Sichuan Provincial Service in Mandarin 2300 GMT 12 Dec 80 HK]

YUNNAN PRICE INSPECTION GROUP--According to a YUNNAN RIBAO report, the Yunnan provincial people's government held a meeting on 12 December on implementing the State Council's circular on price control and on arranging future tasks. A provincial price inspection group was set up at the meeting. The inspection group was headed by Wu Shengmin, the provincial vice governor, and (Wang Shichao), (Liu Hua), (Zhu Qing) and (Wang Ningdao). The inspection group was divided into four teams, and their main jobs were to help, guide, supervise and inspect all areas in implementing the State Council's circular on price controls. The inspection group will work until next year's spring festival. The inspection group will punish those who violate the State Council's circular and award advanced units or individuals. [Kunming Yunnan Provincial Service in Mandarin 1100 GMT 13 Dec 80 HK]

YUNNAN TRADING WAREHOUSE--Kunming, 29 Dec (XINHUA)--A trading warehouse was opened in Kunming on 1 December 1980, jointly set up by 31 border counties in Yunnan. It serves as an agent for buying, selling, storing, transporting and processing farm and sideline products of minority nationalities regions. In less than a month, the warehouse has signed purchase and sales contracts amounting to 1.2 million yuan for eight Yunnan border counties and various provinces and cities. [OW021023 Beijing XINHUA Domestic Service in Chinese 0253 GMT 29 Dec 80 OW]

YUNNAN PRICE CONTROL CIRCULAR--According to a YUNNAN RIBAO report, the Yunnan provincial people's government has issued a supplementary circular to the State Council's circular on price controls. The supplementary circular outlines what must be done in Yunnan in order to implement the State Council's circular. The tasks are: 1) Governments at all levels must widely launch mass inspections of commodity prices; 2) seriously rectify sale and purchase by negotiation; 3) resolutely forbid the raising of commodity prices and the selling of sham products; and 4) people's governments at all levels and in the rural areas must organize inspection teams to launch price inspections, and encourage people to disclose cases which violate the State Council's circular. [Kunming Yunnan Provincial Service in Mandarin 1100 GMT 10 Dec 80 HK]

ZHEJIANG SMUGGLING ACTIVITIES--Since August of 1980, Lishui County in Zhejiang has cracked 724 cases of smuggling goods and selling gold and silver coins. In recent months, smugglers and speculators, after being buffeted in the coastal areas, have sneaked into the mountainous areas of Lishui County to continue their illicit activities. In mid-November, cadres of the county's commercial administrative department, assisted by local militiamen, seized over 890 smuggled wristwatches, over 1,700 silver coins, and some gold and tape recorders in 8 days. On 19 November a smuggler from Gansu Province tried to smuggle 105 wristwatches into Lishui County via Wenzhou. He was arrested the next day. Another smuggler from Wenzhou was also arrested by militiamen when he was buying silver coins at a high price in a brigade in Lishui County. FUJIAN-HITACHI AGREEMENT SIGNED ON ESTABLISHING TV SET COMPANY

Details of Agreement

HK251350 Fuzhou Fujian Provincial Service in Mandarin 1035 GMT 16 Dec 80 HK

[Excerpt] The Fujian Investment Enterprise Company and Fujian Electronic Import and Export Company came to an agreement with the Hitachi Company of Japan on pooling capital for a TV set business. Both sides agreed to establish the Fujian-Hitachi TV Set Company, Limited, for the production of TV sets. The signing ceremony was held in Fuzhou on the afternoon of 13 December and was attended by provincial Vice Governors Guo Chao, Wang Yan and Zhang Yi, responsible persons of departments concerned and all members of the Hitachi Company delegation. Fujian Investment Enterprise Company assistant general manager Zhao Zongxin, Fujian Electronic Import and Export Company general manager (Ping Fan) and Japanese delegates signed the agreement. Each side should contribute half of the investment. The total amount of capital is 3.6 million yuan of renmibi which is equal to 500 million yen in Japanese currency. The aim of this joint enterprise is to produce and sell color and black and white TV sets. This enterprise will produce TV sets on a trial basis in March 1981 and will be formally put into operation in July of the same year. It is estimated that the 1981 annual output of black and white and color TV sets will be 130,000 sets, and after 1981, the annual output of black and white and color TV sets will be 330,000 sets. The products will be sold at home and abroad. The period of the joint operation is 15 years.

Hitachi Delegation

HK251350 Fuzhou Fujian Provincial Service in Mandarin 1035 GMT 16 Dec 80 HK

[Excerpt] The Hitachi Company's friendship delegation, which comprised 20 people, arrived in Fuzhou by special plane on the morning of (?13) December to sign the agreement on the establishment of the Fujian-Hitachi TV Set Company, Limited. During its stay in Fuzhou, the delegation paid a visit to leaders of provincial and municipal governments and to the Fujian electronic equipment plant. Leaders of the provincial and municipal governments, including Ma Xingyuan, Guo Chao, Wang Yan, Zhang Yi and (You Dexin), met and held friendly talks with the members of the delegation. On 14 December at noon, the Hitachi delegation gave a banquet to responsible persons of the provincial and municipal governments and departments concerned.

BRIEFS

GANSU TOURISM--Thanks to the improvement of services and food supply, Gansu Province in 1980 received some 8,000 tourists from 32 foreign countries and regions, doubling the 1979 figure. [Lanzhou Gansu Provincial Service in Mandarin 1125 GMT 31 Dec 80 SK]

GUANGDONG FOREIGN EXCHANGE--The Guangzhou branch of the Bank of China has greatly increased foreign exchange earnings from Guangdong ports this year. By the end of November, it had received foreign exchange earnings of $2,814,600,000, 15.57 percent more than in the corresponding period of last year. [Guangzhou Guangdong Provincial Service in Mandarin 1120 GMT 28 Dec 80 HK]

GUANGDONG RESORT--The Zhongshan Hot Springs Resort, jointly operated by the Zhongshan branch of the China International Travel Service and the China-Macao Construction Investment Company, held a ribbon-cutting ceremony on 28 December at noon. The hot springs resort is stiuated in Sanxiang Commune, Zhongshan County. Construction of the resort began on 1 November 1979. Its area is 480,000 square meters and its buildings cover some 30,000 square meters. Yang Shangkun cut the ribbon. Leading comrades of Guangdong, Guangzhou and Foshan Prefecture, including Liu Tianfu, Liang Lingguang, Liang Weilin, Ou Chu and (Yang Deyuan), attended the opening ceremony. China Travel and Tourism Administrative Bureau director Lu Xuzhang also attended. The hot springs resort will formally open to tourists on 10 January 1981. [Guangzhou Guangdong Provincial Service in Mandarin 1120 GMT 28 Dec 80 HK]

HEBEI TRADE FORUM--The Hebei provincial government recently held a forum on imports and exports to sum up past experiences in import and export work in the past year. The forum held: It is necessary to grasp import and export activities in order to enrich the people and the state. We must also bring the province's superior situation into full play and speed up production of minerals, porcelain wares and other industrial products. We must also increase the varieties of products and promote packaging in order to increase the products' competitiveness in the international markets. It is necessary to improve the management system of imports and exports and attach importance to building enterprises. Responsible comrades of the Hebei provincial people's government Li Erzhong, Guo Zhi and Yue Zongtai spoke at the forum. [Shijiazhuang Hebei Provincial Service in Mandarin 0430 GMT 1 Dec 80 HK]

NEI MONGGOL EXPORT GOODS--Ju Ud League Foreign Trade Bureau had exported some 34.47 million yuan of goods by 11 December, an increase of 12.2 percent over the corresponding 1979 period, prefulfilling the annual plan by 20 days. [SK311058 Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 30 Dec 80 SK]

SHANGHAI FOREIGN EXCHANGE--According to a report by JIEFANG RIBAO, the total foreign exchange earned through trade and other sources in Shanghai reached $4.3 billion in 1980, increasing by 16 percent over that in 1979. [Shanghai City Service in Mandarin 2300 GMT 2 Jan 81 OW]

SHANXI COAL EXPORT--Shanxi Province recently set up a local coal foreign trade company and the company has already signed contracts with Japan, the Philippines, Thailand and Singapore to export some 370,000 tons of coal. So far, 230,000 tons of coal have already been transported to the port and 120,000 tons have been exported. In the past, the province's coal trade was run by the state, but now, since the decisionmaking rights of enterprises have been expanded, the local coal trade company was able to handle business themselves. [Taiyuan Shanxi Provincial Service in Mandarin 2300 GMT 6 Dec 80 HK]

FURTHER DETAILS ON PRC INCOMES SURVEY REPORTED

OW020628 Beijing XINHUA Domestic Service in Chinese 1600 GMT 30 Dec 80

[Text] Beijing, 30 Dec (XINHUA)--The number of families with per capita monthly income over 25 yuan has increased to 76.5 percent of the total number of wage-earning families in China, according to a survey on wage-earning family incomes conducted by the State Statistical Bureau. The survey attributes this increase to the series of measures adopted by the party and state to improve living conditions for Chinese wage-earning families following the smashing of the "gang of four."

The survey employed the cross-section sampling method [hua lei xuan dian deng ju chou yang 0439 7352 6693 7820 4583 5415 2132 2876]. It covered 86,955 families of various occupations--industry, capital construction, agriculture, forestry, communications, postal and telecommunications, commerce, urban public utilities, science, culture, education, public health, finance, office and mass organizations--in Beijing, Tianjin, Shanghai and 41 other cities.

The following are the results of this survey:

A Chinese wage-earning family in the first quarter of 1980 had an average of 4.48 persons. Of these, 2.47 persons or 55.1 percent had jobs. Thus, a wage earner supported an average of 1.81 persons (including the wage earner himself; this is also true for the figures below). The average wage was 63.92 yuan (including bonuses, subsidies, allowances for nonstaple foods, etc.). The per capita monthly income for a wage-earning family (including constant and inconstant income) was 35.8 yuan. Of this figure, 32.68 yuan was for the costs of living (income that can be applied to living costs after expenses of supporting relatives and donations and gifts are deducted from total income).

There were 10 cities out of the 44 surveyed where this income for living costs exceeded 35 yuan. They were Guangzhou, Shanghai, Urumqi, Foshan, Hangzhou, Beijing, Jinan, Shenyang, Yantai and Tianjin.

This income for living costs was between 30 and 35 yuan in 16 other cities. They were Dandong, Shijiazhuang, Changsha, Wuhan, Nanjing, Anshan, Chengdu, Chongqing, Qiqihar, Jinzhou, Xian, Nanning, Zhengzhou, Huangshi, Jilin and Changchun.

The remaining 18 cities averaged under 30 yuan: Harbin, Yinchuan, Handan, Hefei, Lanzhou, Daqing, Luzhou, Xianyang, Zaozhuang, Hohhot, Qinhuangdao, Taiyuan, Fuzhou, Nanchang, Xining, Kunming, Kaifeng and Qingjiang.

The survey divided wage-earning families into the following five groups on the basis of this living costs income received by the families.

1. Families with a cost of living income over 50 yuan accounted for 9.3 percent of those surveyed. Several factors accounted for their relatively high income. First, their wages were generally high--71.16 yuan per wage earner or 11.3 percent over the average wage of all families surveyed. Second, each family had fewer people—3.53 persons or 21.2 percent under the average. Third, there were more wage earners in each family—3.01 persons or 21.9 percent more than average. The employment rate was 85.3 percent. Each wage earner in these families supported only 1.17 persons.

2. The higher-middle income families with cost of living income between 30 and 50 yuan accounted for 30.2 percent of those surveyed. In this group, income exceeded expenditures and living standards were fairly good. The average wage was 64.43 yuan. The number of people in each family was 4.18 while the number of wage earners was 2.85. A wage earner supported an average of under 1.5 persons.

3. Middle income families with cost of living income between 25 and 35 yuan accounted for 37 percent of the surveyed. The average wage in this group was 63.54 yuan. Their living standards were lower than the higher-middle income group because there were more people in the family, fewer wage earners and more dependents.

4. The lower income group with cost of living income between 15 and 25 yuan accounted for 21.4 percent of the surveyed. Families in this group had relatively difficult living conditions. The average wage was 61.89 yuan. Each family had an average of five persons. Only 1.98 persons in each family had jobs. An average wage earner supported 2.54 persons.

5. Poverty-stricken families with cost of living income under 15 yuan accounted for 2.1 percent of the surveyed. Families in this group maintained rather difficult lives. Their income could not cover their expenses and they had to depend on the subsidies from their work units. The average wage in this group was 62.43 yuan, only 1.49 yuan less than that of those surveyed. However, because of the large family size (5.3 persons), fewer wage earners (1.31 persons), more dependents (4.05 persons) and a higher unemployment rate (0.39 persons or one in every 2.5 families), their cost of living income was only 13.26 yuan.

The survey indicates that the income level for Chinese wage-earning families is not balanced. Workers in cultural, education, public health, office and mass organizations received lower incomes. The survey also shows that workers recruited between 1958 and 1966 received less pay than others and their family burden was heavier.

Some wage-earning families whose employment rate and pay had remained unchanged over the years were receiving less income in real terms because of rising inflation. Therefore, stabilizing the retail prices of daily necessities to prevent the reduction of their income in real terms is an important issue for serious study and resolution.

LABOR BUREAU NOTES MORE YOUTHS PLACED IN JOBS IN BEIJING

OW240835 Beijing XINHUA in English 0819 GMT 24 Dec 80

[Text] Beijing, December 24 (XINHUA)—More than 181,000 young people in the Chinese capital have been placed in jobs this year and about 40,000 are still waiting their turns, according to the city's Labor Bureau today.

Some 130,000 of these young people entered state or collective enterprises, said Huang Heping, an official at the Labor Bureau. About 24,000 have been recruited into factories run by neighborhood communities, some have set up their own businesses, and others have entered colleges, vocational schools or the army.

Beijing had a total of 220,000 young people waiting for jobs this year, Huang Heping said. Among them, 110,000 were middle school graduates, 40,000 were educated youths who had returned from the countryside, and 70,000 were left over from last year.

Beijing has taken measures this year to give factories and other enterprises more power to enroll their own workers under unified city plans. Children of workers and staff members have priority in the recruitment.

Some 4,700 labor service companies have been set up in the city this year to arrange jobs for youths in commerce, repairs, service trades, construction and other urban jobs.

Some jobless youths set up their own restaurants, tea houses and other small businesses, while others are engaging in tailoring or photography cooperatives.

In the last two years, a total number of 510,000 young people have been given jobs, Huang Heping said.

BRIEFS

CHANGSHA HOUSEHOLD SURVEY--The Changsha Municipal Statistics Bureau recently carried out a sample survey of residential households. The results of the survey showed that more people are now in employment and that there has been a big increase in household purchase of consumer durables. This demonstrates that due to the concern of the party and government for the vital interests of the people in recent years, a lot of work has been done to repay the debts in employment and living standards caused by the "gang of four's" interference. Definite successes have been scored in this work. The survey showed that average monthly cost of living per capita is now 77.96 percent higher than in 1964. Allowing for increased prices, this represents an increase of 42.39 percent in real terms. On average there are 57 bicycles, 33 sewing machines, 188 wristwatches, 44 radio receivers, 5.62 television sets and 4.36 gramophones to every 100 households. The average household consists of 3.8 persons. According to the survey, one-third of households have saved up the money and are waiting to buy various consumer durables. [Text] [HK200224 Changsha Hunan Provincial Service in Mandarin 2315 GMT 19 Dec 80]

FUJIAN WORKERS' LIFE--The Fujian provincial people's government recently approved the report of the provincial economics committee and the Federation of Trade Unions surveying the life of workers. The report demanded that the whole province carry out an inspection of the life of workers and improve their living conditions. All leading comrades must attach great importance to the life of workers since it is directly related to the progress of the four modernizations. It is necessary to bring into full play the role of workers' congresses and carry out serious investigations of problems that are discovered. It is also necessary to educate the worker to struggle arduously and to consider the interest of the entire state. [Fuzhou Fujian Provincial Service in Mandarin 1035 GMT 14 Dec 80 HK]

HEILONGJIANG WORKERS' LIVELIHOOD--The Heilongjiang provincial government recently held a meeting to urge governments at all levels and all provincial organizations to inspect workers' livelihood and solve their difficulties. Particularly, efforts were called for solving the workers' housing problems. [Harbin Heilongjiang Provincial Service in Mandarin 1100 GMT 6 Dec 80 SK]

LIAONING PLACES JOBLESS YOUTHS--Liaoning Province has placed 730,000 urban jobless youth, 530,000 of which were fully employed. It is expected that the provincial annual placement plan will be overfulfilled by the end of 1980. [Shenyang Liaoning Provincial Service in Mandarin 2200 GMT 27 Dec 80 SK]

HOHHOT EMPLOYMENT MEETING--According to our correspondent (Cao Shuliang), the Hohhot municipal people's government recently held a labor employment meeting, putting forward the following four measures in this regard for 1981:
1) Vigorously develop the collective economy and properly develop an individual economy which does not exploit other people. Politically, all collective units should be treated equally without discrimination. Economically, the resources of such units should not be transferred indiscriminately. Assistance should be given them in taxation, loans, materials, and labor protection. Length of service should be calculated from the first day at work for those who work at organizations enacting various types of collective ownership. 2) Establish plants and farms for educated youths and develop agriculture-industry-commerce integrated complexes. As for those who voluntarily work in educated youth plants and farms, it is not necessary to change their registered domicile in the city or their grain distribution. 3) Actively develop various kinds of vocational education and open up study opportunities. All trades, enterprises and establishments are allowed to run vocational classes to enroll the children of workers and staff members. 4) Reduce the number of workers who are not included in the state plan. By the end of June 1981, all such workers at units owned by the whole people and by collectives should be dismissed after receiving their wages. All laborers working on public projects without the permission of the regional authority should be dismissed. [Excerpts] [SK280810 Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 27 Dec 80]

SHANGHAI COOPERATIVES--The people who were waiting for jobs in Shanghai formed more than 770 cooperatives this year. About 73 percent of the more than 10,000 participants of those cooperatives are young people. Those cooperatives are much welcomed by the masses. They include restaurants, clothing stores, hotels and department stores. In order to further promote the forming of cooperatives, the municipal office in charge of collective enterprises held a meeting on the afternoon of 29 December to exchange experience in running cooperatives. [Shanghai City Service in Mandarin 1130 GMT 30 Dec 80 OW]

SHANXI LABOR EMPLOYMENT MEETING--The Shanxi Provincial CCP Committee recently held a meeting in Taiyuan on labor employment. The meeting exchanged experiences on settling unemployed people in the province and studied policies to develop the individual and collective economies. The meeting held: We must vigorously develop the light and textile industries, handicraft works, services and other trades to provide employment for more people. All units must strive to provide employment for more people in accordance with their local conditions. The province will encourage the setting up of individual enterprises by means of exempting them from taxation. The meeting also demanded that all areas and departments strengthen leadership and attach importance to settling unemployed people to make full use of the adequate labor force in the province. [Taiyuan Shanxi Provincial Service in Mandarin 2300 GMT 3 Dec 80 HK]

XINJIANG URBAN JOBLESS YOUTHS--A number of deputies to the third session of the Fifth Xinjiang Regional People's Congress have shown deep concern for the employment and ideological education of jobless youths. They pointed out: It is necessary to strengthen political-ideological work on urban jobless youths, pay attention to their vocational training and increase employment opportunities so that they can receive a good education and have work to do. [Text] [OW152028 Urumqi Xinjiang Regional Service in Mandarin 1620 GMT 15 Dec 80]

YUNNAN TRADE UNION MEETING—The first plenary session of the Fifth Committee of the Yunnan Provincial Federation of Trade Unions has elected the chairman, vice chairmen and standing committee members of the Fifth Provincial Federation of Trade Unions Committee. (Cao Liangzhu) was elected chairman, (Xu Renlong) and (Deng Xiaoshu) were elected vice chairmen. [Kunming Yunnan Provincial Service in Mandarin 1100 GMT 8 Dec 80 HK]

TRANSPORTATION

WATER TRANSPORT ENTERPRISES OUTLINE 1981 TASKS

OW311122 Beijing XINHUA Domestic Service in Chinese 1447 GMT 29 Dec 80

[Text] Beijing, 29 Dec (XINHUA)--It was pointed out at a recent work conference of enterprises directly under the Ministry of Communications that the major communication work tasks in 1981 are to continuously eliminate the influence of left-deviationist thinking, proceed from reality in doing everything, carry out the readjustment in a down-to-earth manner and to strengthen port construction and other weak links.

Water transport enterprises are directly under the Ministry of Communications. Delegates attending the work conference reviewed the initial success in implementing the policy of readjustment over the past year. In 1980 each and every enterprise directly under the Ministry of Communications earnestly put its own capital construction projects in good order, readjusted the proportions between ports and shipping, transport and loading and unloading, the operational frontline and rear services, and production and livelihood, suspended and deferred a certain number of construction projects and shifted the focus of investment to port construction, scientific research and education. Thanks to the efforts to tap potential and transform existing ports while stepping up the unfinished and supplementary projects of new ports, the loading and unloading capacity of ports increased by 4 million dun in 1980. Fairly good progress was also made in building workers' housing projects. Some 980,000 square meters of floor space are expected to be finished by the end of this year.

The conference also pointed out: Because ideological understanding lagged behind developments and because there was less determination and insufficient measures in the past 2 years, the expected achievement in readjustment work has not yet been made. In 1981 it is necessary to further raise our understanding, proceed from the overall interests of the national economy and to resolutely implement the readjustment policy. Building capital construction projects, efforts should be made to implement the principle of giving priority to tapping potential, technical renovation and transformation and to guarantee the needs of port construction while arranging construction investment for key projects. Efforts should also be made to grasp well the construction of such key ports as Shanghai Tianjin, Huangpu, Qinhuangdao, Dalian and Lianyunkang, give priority to the construction of ports especially designed for containerized freight, coal, grain, timber shipment and facilities for passenger transport service, and do an even better job on the unfinished and supplementary projects as well as on other projects which can be put into operation within a short period.

CSO: 4006

BRIEFS

CIVIL AVIATION STATISTICS--Beijing, 16 Dec (XINHUA)--China's Civil Aviation Department has fulfilled this year's passenger and cargo transportation quotas 21 days ahead of time. As of 10 December, the total transport turnover volume was 13 percent over the same period last year. During the same period, the passenger transport volume increased 11 percent. The entire year's profit-to-the-state plan was fulfilled 3 months ahead of time. [Beijing XINHUA Domestic Service in Chinese 0712 GMT 16 Dec 80 OW]

SHAANXI-GANSU RAILWAY ELECTRIFICATION--The electrification of the Baoji-Tianshui railway has been completed. The opening ceremony was held on 8 December. This line, 150 kilometers long, was built at the beginning of the 1940's. It has always been a bottleneck due to complex terrain. The electrification project began in May 1978. [HK130738 Xian Shaanxi Provincial Service in Mandarin 2300 GMT 8 Dec 80 HK]

ANHUI HIGHWAY MANAGEMENT--The Anhui provincial people's government recently issued a circular on improving the management of highways. The circular prohibits the use of highways, highway bridges and other highway facilities for other than transport purposes, such as drying grain, threshing grain, storing materials. It also prohibits people from destroying or damaging road signs or felling the trees by highways. All prefectural administrative offices and municipal and county governments are requested to take measures for the implementation of the circular. [Hefei Anhui Provincial Service in Mandarin 1100 GMT 28 Dec 80 OW]

GUANGXI SHIPWRECK--According to a GUANGXI RIBAO report, the wreck of the passenger ship, Guilin 302, has already been salvaged. As revealed by departments concerned, there were 364 passengers on board the ship including 31 crew members, and the total number of casualties was 100. [Nanning Guangxi Regional Service in Mandarin 1130 GMT 4 Dec 80 HK]

GUANGZHOU-HONG KONG SHIPPING--Cargo shipping between Zhuhai Municipality and Hong Kong officially began on 18 December. The cargo shipped from Hong Kong to Zhuhai include motor vehicles, motor bicycles, refrigerators and other electric appliances, while local products were shipped from Zhuhai. [HK290946 Guangzhou Guangdong Provincial Service in Mandarin 1120 GMT 25 Dec 80 HK]

HENAN MOTOR VEHICLE PURCHASE--From January to November, Henan Province purchased 1,141 motor vehicles. The reason for such a large amount of vehicles purchased within 11 months was that some units had illegally purchased these vehicles at high prices. As a result of this, gas supply became short. In order to cut unnecessary expenses and save energy, the Henan Provincial CCP Committee and people's government demanded that no organs and units purchase motor vehicles without permission of the provincial CCP committee. [Zhengzhou Henan Provincial Service in Mandarin 1100 GMT 26 Dec 80 HK]

HUBEI RAILWAY TRANSPORTATION--Wuhan Railway Bureau has strengthened management over transportation and has fulfilled the year's passenger and freight transport quota 1 month ahead of schedule. Wuhan Railway Bureau's scheduled freight volume decreased by 8 percent over last year, but in order to increase work and profit, they worked hard to organize more transportation of minerals and other materials. [HK200616 Wuhan Hubei Provincial Service in Mandarin 1100 GMT 6 Dec 80 HK]

JIANGSU HAULAGE RECORD--Nanjing, 2 Jan (XINHUA)--Transport workers in Nanjing, Jiangsu Province, have set a national record for a single load by moving a complete reaction tower weighing 374 tons from the dock to the site of a new chemical plant 4 kilometers away by highway. The tower, to be installed at the Nanjing Chemical Works, is 27.2 meters long and 4.12 meters high. The workers buttressed several bridges along the highway before they moved the tower. [Text] [Beijing XINHUA in English 1204 GMT 2 Jan 81 OW]

LIAONING COMMUNE HIGHWAYS--Liaoning Province has established a complete highway network for all the 1,149 communes throughout the province. All the communes have highways connected with their county seats. The total length of these highways is 14,000 kilometers. [Shenyang Liaoning Provincial Service in Mandarin 1100 GMT 7 Dec 80 SK]

LIAONING PORT IMPROVEMENT--Shenyang, 25 Dec (XINHUA)--Foreign export operation has been resumed in Liaoning's Yingkou port, one of the major seaports in northeast China, after renovation. Recently two shipments of pig iron by two Chinese oceangoing freighters left this port for Japan. During renovation, the port's fairway was dredged and 21,000 square meters of concrete storage yards and roads were built. [OW291131 Beijing XINHUA Domestic Service in Chinese 0110 GMT 25 Dec 80 OW]

SHANDONG RAILWAY LINE--In Shandong, a 161-kilometer long railway line, starting from Xindian station along the Jiaoji railway and passing through 19 stations to Taian station to link up with the Jingfu railway, opened to traffic 1 January 1981. Construction of this line took 6 years and 200 million yuan of investments. [SK021253 Jinan Shandong Provincial Service in Mandarin 2300 GMT 31 Dec 80 SK]

SHANGHAI TRAFFIC SITUATION--The Shanghai municipal people's government this afternoon called a mobilization meeting to improve Shanghai's traffic situation. The meeting urged the masses of people to observe traffic rules, maintain traffic order and insure traffic safety. Attending the meeting were also Acting Mayor Wang Daohan and Vice Mayors Han Zheyi, Zhao Zukang, Wang Jian and Yang Di, and responsible personnel from various departments concerned, totaling 1,000 persons.

Speaking at the meeting, Acting Mayor Wang Daohan called on leading personnel at all levels to fully understand the importance of traffic control, fully publicize traffic control, and adopt effective measures to improve Shanghai's traffic situation. [Shanghai City Service in Mandarin 1130 GMT 23 Dec 80 OW]

XINJIANG HIGHWAY CONTROL--Detailed measures were issued recently by the people's government of Xinjiang Autonomous Region to strengthen highway control, safeguard highway facilities and improve traffic conditions. The measures point out that highways and other highway facilities are state property, and that no one is allowed to damage or illegally seize such state property. Piling up construction materials along highways or using highway facilities for threshing or other farming purposes are strictly prohibited. The measures also call on all localities to protect highway bridges and tunnels when launching farmland capital construction. [Urumqi Xinjiang Regional Service in Mandarin 1300 GMT 18 Dec 80 OW]

ZHEJIANG HIGHWAY CONSTRUCTION--The Zhejiang Provincial Communications Department recently held a discussion meeting on highway construction in mountainous areas of the province in Jinyun County. In the past 4 years, more than 5,500 kilometers of mountain highways have been built. Now 77 percent of the communes in the province are served by motor vehicles. [Hangzhou Zhejiang Provincial Service in Mandarin 1100 GMT 27 Dec 80 OW]

BEIJING NO 2 RING ROAD--Beijing, 25 Dec (XINHUA)--A new road ringing downtown Beijing opened to traffic today, with construction of three cloverleaves and the bicycle lanes in the eastern and northern sections still to be completed. The new No 2 ring road runs for 23.3 kilometers, basically following what used to be the old city wall. It has a total of nine cloverleaves at junctions with main roads. Its driving lanes, 22.7 to 28.4 meters wide, are separated from bicycle lanes which are six to nine meters wide. This is part of a master road scheme for the city, laid out like three concentric rings. The two other roads, the inner city ring road, and the No 3 ring road which is still under construction, connect with all the main highways leading to the outskirts of the city and to other cities in the country. The No 2 ring road is designed to ease some of the traffic load in the city proper and improve the traffic for the 3 million bicycles in the city, said an official of the Capital Construction Engineering Corps. [OW271231 Beijing XINHUA in English 1201 GMT 25 Dec 80 OW]

JIANGSU DEEP-WATER BERTHS--Beijing, 20 Dec (XINHUA)--Two 10,000-ton deep-water berths at Nantong harbor in east China's Jiangsu Province went into operation today, according to the Ministry of Communications. The new anchorages will increase Nantong harbor's annual handling capacity from 3 to 3.8 million tons. This is the first time that deep-water berths have been built at Yangtze River ports. They will speed both domestic and foreign shipping by allowing certain cargoes to bypass crowded Shanghai harbor, the largest of its kind in China. Ships carrying coal from north China destined for Yangtze River cities can now anchor directly in Nantong harbor. Cotton can be shipped directly from Nantong to north China. The areas around Nantong are one of China's major cotton growing centres. Imported iron ore, which used to be transshipped through Shanghai, will be handled through Nantong, while berite produced in central China's Hubei Province, will be exported to the United States from the new Nantong berths. Another deep-water berth is being planned. [Text] [Beijing XINHUA in English 1201 GMT 20 Dec 80 OW]

TIANJIN PUBLIC WORKS CONSTRUCTION--Tianjin, 23 Dec (XINHUA)--Tianjin, one of China's major industrial and commercial centers and north China's biggest trade port, has managed to build badly needed public facilities over the last 2 years by greatly cutting its investment in industrial construction projects. The Municipal Statistics Department said that the city's investment this year in housing and public works accounts for 55 percent of the total. This compares favorably with 46 percent in 1979, and 31.7 percent in 1978. Over two-thirds of all construction workers are now engaged in this work. Tianjin added 1.26 million square meters of residential floor space from January to October this year and 2.05 million square meters in 1979. The total floor space in the past 22 months is 190,000 square meters more than in the whole period of 1966-76. In addition, the city built 45 primary and middle schools, 190 shops and stores and 5 cinemas and theaters. Hospitals, roads, bridges and sewers were repaired. [Beijing XINHUA in English 1221 GMT 23 Dec 80 OW]

TIANJIN PORT CARGO BERTHS--Tianjin, 24 Dec (XINHUA)--Five cargo berths capable of handling ships of up to 10,000 tons went into operation today at Tianjin harbor, one of the largest ports in north China. The harbor now has 22 berths of the 10,000-ton class and a total annual cargo handling capacity of about 11 million tons. Tianjin is next only to Shanghai in the volume of export and import general cargo goods it handles and every year it accommodates more than 1,600 Chinese and foreign cargo ships and dozens of international tourist passenger liners. A new container berth is expected to be completed in 1981 and two more general cargo berths and three other container berths are under construction. [Beijing XINHUA in English 1207 GMT 24 Dec 80 OW]

CSO: 4006

GENERAL

BRIEFS

BEIJING UNDERGROUND FACILITIES--Over the past year, the Beijing municipal party committee has made full use of people's air defense projects to better serve the people. Built in the air defense projects are 53 hotels and reception centers with 6,060 beds, 7 shopping centers with annual sales of 30 million yuan, 56 underground workshops with annual output value of 61 million yuan and 290 underground warehouses. The municipal party committee has also used the underground facilities to provide mess halls and gathering places for factory workers. [Beijing Domestic Service in Mandarin 0400 GMT 12 Dec 80 OW]

GUANGZHOU ZHOU ENLAI'S WORK--The Guangdong XINHUA Printing House and the Guangzhou Municipal HONGQI Printing House have fulfilled the tasks of printing the first edition of the "Selected Works of Zhou Enlai" in recent months. These two houses received these tasks in early November this year. They were told to print 150,000 copies of the "Selected Works of Zhou Enlai" and have now fulfilled the tasks on time. [HK290946 Guangzhou Guangdong Provincial Service in Mandarin 1120 GMT 25 Dec 80 HK]

LIAONING EMBEZZLEMENT--People's procuratorates at all levels in Shenyang Municipality have been engaging in economic procuratorial work with emphasis on dealing with embezzlement. Some 1.47 million yuan of losses have been retrieved. [Shenyang Liaoning Provincial Service in Mandarin 2200 GMT 8 Dec 80 SK]

LIAONING COMPLEXES--According to incomplete data, Liaoning Province has invested 70 million yuan to establish 449 agriculture-industry-commerce complexes in the past year. These complexes have hired some 33,000 people and have earned 16.8 million yuan. [Shenyang Liaoning Provincial Service in Mandarin 1100 GMT 12 Dec 80 SK]

JIANGSU DAMAGED HOUSES--Because of frequent rainstorms this year, some 220,000 houses collapsed and 350,000 houses were damaged in Jiangsu Province. The provincial authorities allotted 4 million yuan along with 60,000 bamboo poles, 8,400 cubic meters of lumber and 1,500 dun of cement for the reconstruction of the houses. At present most of the houses have been rebuilt or repaired. [Nanjing Jiangsu Provincial Service in Mandarin 2300 GMT 5 Dec 80 OW]

LIAONING CORRUPTION CASE--Shenyang, 14 Dec (XINHUA)--Na Handong, responsible person of a factory run by No 104 middle school in Huanggutun District of Shenyang, Liaoning, who took some 100,000 yuan of illegal commission from signing processing contracts with local communes, was recently arrested in

Guangdong's Shantou City while attempting to escape abroad. He was returned to Shenyang with some 40,000 yuan of illicit money recovered. Na Handong, who is now 28 years old, was convicted in the past on charges of larceny, speculation and profiteering, and extortion, and sent to reeducation through labor. He escaped three times from the reeducation center and has been wanted by the law since 1976. [Beijing XINHUA Domestic Service in Chinese 0123 GMT 14 Dec 80 OW]

DEVELOPING MARKET FOR MEANS OF PRODUCTION

HK240344 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 9, 15 Sep 80 pp 35-37

[Extracts from speeches Delivered at Biweekly Discussions on Economic Problems (Part II)--Article by Zhang Shenyi [4545 1957 5030]: "Carry Out the Principle of Combining the Two Regulations To Develop the Market for Producer Goods"]

[Text] Since the party Central Committee introduced the policy of combining regulation by planning mechanism with regulation by market mechanism, people have come to realize that the means of production should be treated as a part of commodities. Thus, the market for the means of production is gradually being enlivened.

The Capital Goods Market Is Becoming Enlivened

The circulation system for the means of production in China was established in the early 1950's in accordance with the guiding principle that the means of production are not commodities. The means of production are mainly distributed and allotted according to the state plan, thus restricting free circulation. For a long period, this system of circulation has given rise to many setbacks such as excessive control of distribution by planning mechanism, failure to link production with demand, excessive number of links in the chain of circulation and rigid control of price management. All this is not conducive to activating the national economy. However, the situation has taken a turn for the better since last year and the changes can be discerned in the following four aspects:

1. There is a considerable amount of free circulation of the means of production on the market. For example, in Shanghai, 0.2 million tons of steel products and 0.1 million cubic meters of timber were directly purchased through the means of free circulation last year; likewise in Liaoning Province, 0.16 million tons of steel and 0.1 million cubic meters of timber were purchased. Taken as a whole, in most provinces, municipalities and autonomous regions, the means of production purchased through free circulation accounted for about 10 to 20 percent of the total amount of consumption. However in some provinces such as Jiangsu, 20 to 40 percent was attained and the nearer one got to the grassroots, the more lively free circulation became. Take Jiangmen Municipality in Guangdong Province for example, where 44 percent of

coal, 27 percent of steel products, 55 percent of timber and 20 percent of cement was purchased through free circulation. In Changshu County of Jiangsu Province, 70 percent of all kinds of means of production was purchased through free circulation.

Where do the means of production in free circulation derive from? Apart from the products which are marketed by the industrial enterprises themselves, they are the results of mutual coordination among enterprises, exchange of goods kept in stock and the results of processing and refitting. In addition, the means of production in free circulation are obtained from the three categories of the means of production which are not subject to unified distribution. Last year, through coordination among production units all over the country, we got a considerable amount of the means of production--10 million tons of coal, 6 million tons of coke, 0.7 million tons of pig iron, 0.8 million cubic meters of timber and 0.8 million tons of cement; through exchange of goods kept in stock, over 3 million tons of steel products and some 3.8 billion yuan's worth of mechanical and electrical products were redistributed; in Jiangsu and Guangdong provinces alone, some 0.1 million tons of wire rods and small-scale steel products were processed; the means of production (including the three categories of the means of production) purchased, sold, processed and transported under the contract by the capital goods service companies, which are subsidiaries of supply departments, amounted to 3.5 billion yuan.

2. Part of the means of production distributed according to state plan are supplied in more flexible ways. The main aspects are summed up as follows. First, impose no restrictions on the purchase of some means of production so that they can be bought freely on the open market. This system is carried out in accordance with productive capacity: Some items are fully supplied without any restrictions. Take mechanical and electrical products for example. Of 157 products distributed by the State Planning Commission and the State Bureau in charge of handling goods and materials, most of the products could be ordered and bought freely on the open market this year with the exception of 11 items which were in fairly short supply. In Sichuan Province, out of 356 items of the means of production subject to unified distribution, 300 items were fully supplied without any restrictions; some can be bought freely on the open market but the amount is restricted to some extent. Take chemical materials distributed according to state plan in Shanghai for example. Over 90 percent of the small clients (the requirement accounted for less than 10 percent of the total volume of supply) could purchase the material freely on the open market and restrictions were only imposed on less than 10 percent of the large clients (the requirement accounted for more than 90 percent of the total volume of supply). In some localities, equipment for scientific research or maintenance could also be bought freely on the open market. Second, put into practice a system of rationing by coupons: after receiving the coupons allotted in a planned way, clients are able to purchase the materials at any branch of the supply departments whenever they need to. As the supplies are guaranteed, the clients are not in a hurry to purchase new materials. Instead, they make use of their own reserve of materials. Take the coupons for non-ferrous metal materials for example. Coupons for purchasing 104,000 tons of

materials were issued last year but by the end of the year, only 1,371 tons of materials were allotted. As a result, the stockpiled material kept by the clients was decreasing and the supply departments could turn over a part of their surplus reserve materials to the national treasury. Third, materials are provided on the basis of verification. Take Changsha, Zhuzhou and Hengyang, three municipalities in Hunan Province for example. Last year, the steel products which were needed for production in 24 machinery plants were provided by supply departments concerned in accordance with the production plans and on the basis of verification. As a result, the actual consumption of the materials was 17 percent less than the quota fixed by supply departments. Fourth, break down the conventions that no capital goods are provided for civil use. Take Shanghai for example. Last year, the supply department set up supply and marketing shops for steel products and more than 80 tons of zinc-plated pipes were provided for installing water meters in more than 7,000 households. In addition, some 250 tons of small circular steel products were supplied so that over 3,400 dwellers could have enough materials to repair their houses. All this was warmly welcomed by the masses.

3. New forms and experiences of promoting regulation by market mechanism have been created. First, the setting up of individual markets for the means of production: at the beginning, markets were temporarily set up for dealing with overstocking of products and selling goods in stock but now they have become permanent and thus promote the scale of new products and deal in futures. In addition, the markets have turned into commodity exchange centers selling and purchasing goods with flexible prices and without any controls. At present, such markets for the means of production have been set up in more than 60 big or medium-sized cities, of which Shanghai has become the nationwide exchange center for the means of production. Second, putting goods on the market through purchasing and selling at negotiated prices. Take the wire rod market in Changzhou Municipality for example. Last year, the price once rose to 900 yuan per ton but it dropped to 850 yuan after the supply department put the goods on the market through purchasing and selling at negotiated prices. The market price of wire rod in Guangdong once reached 1,300 yuan per ton but was soon reduced to 800 yuan after the supply deparment succeeded in processing the wire rod in batches and put the products on the market. Third, opening a path for developing overseas markets. Take Shanghai supply departments for example. In the purchasing and marketing of chemical materials, they sold the goods which had been kept in stock for a long time and bought materials which were in short supply. In so doing, they succeeded in earning $4.8 million of foreign exchange and importing some 7,000 tons of chemical materials last year. In addition, an international trust business was established in Shanghai last October and as much as $120,000 of foreign exchange was gained by the end of last year. In the first half of this year, foreign exchange earnings amounted to $560,000 and the profits turned over to the state totaled more than $100,000. Fourth, publishing journals introducing market conditions and business forecasting. The following journals are already in circulation: "Market Conditions of Goods and Materials" published by the State Goods and Materials Bureau, "Shanghai Goods and Materials Market" published by Shanghai, "Market Conditions of Materials in Sichuan" published by Sichuan Province, "Liaoning

Materials Market" published by Liaoning Province, "Trends in Goods and Materials" published by Hebei Province and "Trends in the Flow and Circulation of Materials" published by Guangxi Autonomous Region. These journals cover a wide range, such as reports on market conditions, advertisements, vocational knowledge and exchange of market experience. All this has played a big role in enlivening the markets for the means of production.

4. There has begun to be some competition on the market. The markets for the means of production have begun to be enlivened. However, when the enterprises are given the right to market their own products, some people are worried that the supply departments will have little business to do. As a matter of fact, competition is conducive to overcoming the bureaucratic workstyle and raising the level of management and service. Therefore, in those places where competition is encouraged properly, business is brisk and expanded. Take the supply departments in Beijing for example. Spurred on by competition, last year the total sales volume increased by 37 percent compared with the previous year. In the first quarter of this year, the sales volume of the Shanghai Mechanical and Electric Company rose by 8 percent over the corresponding period of last year. Of course, socialist competition should include both competition and cooperation. The enterprises should sell their own products according to the state policies and the supply departments should be active in marketing products or acting as commission agents so as to help the enterprises promote the sale of their goods.

Some Problems That Require Research and Improvement

The circulation of the means of production in China is subject to the direct control of state planning but the institutions for handling the circulation are set up by various departments or regions in accordance with the division of the administrative system. Such a state of affairs is harmful to promoting socialist production or circulation. To meet the needs of socialist commodity production and further develop the markets for the means of production, it is necessary to improve the work of planning according to the principle of integrating regulation by planning mechanism with regulation by market mechanism. In the system of planning and circulation, some reform should be made so as to fill the gaps and complete the links. Therefore, problems concerning the four following aspects must be dealt with properly:

1. There should be a steady and practical long-term plan. By observing the trends in the circulation of the means of production, it is obvious that for a long period, it is precisely such guidance afforded by long-term planning that we have been lacking and we do not leave a sufficient margin when drawing up a plan each year. In addition, there is a considerable gap with regard to the means of production. Thus the concept has been formed suggesting that under a socialist system, the supply of the means of production can never meet the demand. From the view of planning, there are not enough resources to go around and as far as production is concerned, people purchase whatever is produced and there is no competitive pressure at all. Under such circumstances, it is impossible, in fact, to enliven the circulation of the means of production.

Since the policy of readjusting the national economy put forward by the party Central Committee was implemented last year, the capital construction front has begun to be curtailed and the production quotas been comparatively put into effect. As far as the national economy is concerned, what is in short supply and what is overstocked can be seen more clearly. All this has provided conditions for reducing the scope of distribution of the means of production, enlarging market supply, carrying out competition and enlivening circulation. Therefore, it can be said that without the readjustment of the national economy, the market for the means of production could hardly be as active as it is today. We must have a stable and long-term plan in order to prevent the occurrence of guidance by planning which is divorced from reality and develop the present favorable situation which is based on readjustment.

2. The scope of production plans and construction projects which are of a mandatory nature should be gradually reduced. All this calls for reform of the current planning system so as to give the enterprises even more power to purchase and market the means of production and further enliven the circulation of the means of production. We hold the view that as long as the state manages to control the ratio between accumulation and consumption and bring about an overall balance, the scope of targets which are of a mandatory nature should gradually be reduced whereas the scope of targets which are for reference be enlarged. Otherwise, it will hold back the business operation of enterprises and the circulation of the means of production.

3. Production and circulation must be regulated by conscious use of economic levers. One of the striking contradictions in the circulation of the means of production lies in the sharp increase of such stockpiled goods as rolled steel and mechanical and electrical products. Such a situation is mainly caused by planning errors. However, there are also some contradictions between self-marketing (this refers to the principle of enterprises being allowed to market their own products) and the utilization of stockpiled materials. These contradictions cannot be solved simply by imposing restrictions on self-marketing but they should be handled by economic means taken on the basis of the improvement of planning. First, change the irrational phenomena of the current planned price system whereby products which are in excessive supply are profitable and fetch a high price whereas those in short supply are less profitable and of low price, so steer the enterprises toward going in for production according to demand. Second, implement a system whereby circulating funds cannot be used without compensation to enable the enterprises to strengthen their economic accounting, overcome blind accumulation of goods and ensure that the surplus means of production are "disgorged." Third, bring into full play the regulatory role of supply departments so as to maintain the equilibrium between supply and demand, lower the price of overstocked materials which are in excessive supply and make them available for the market. On one hand, the enterprises have to cut down the production of products which are kept in stock for a long time; on the other hand, they should enlarge the production of products in short supply by actively organizing processing, reforming the system and coordinating and ensuring that they earn certain profits. In so doing, the results are much better than those achievable by merely issuing administrative edicts and the market for the means of production will become more active than it is today.

4. Supply departments which distribute the goods and materials should be run as commercial departments for the means of production. Under socialism, the means of production are treated as commodities. The commercial departments for the means of production should promote circulation according to the principle of commodity exchange and expand the market for the means of production under the guidance of state planning. We hold that first, the scope of unified distribution should be reduced and the channels for commodity circulation be enlarged. Generally speaking, the means of production can be divided into three types of purchase system--namely planned purchase, priority purchase and free purchase--according to the roles they play in people's livelihood and the situation of supply and demand. The enterprises can sell all of their own products except those which are subject to purchase by the commercial departments for the means of production. All types of means of production should be supplied in full without any restrictions if the conditions allow. Those which are in short supply should be restricted by coupons. Therefore, the supply of the means of production should be based on the principle of speeding up the turnover and variety according to different conditions. Some of the means of production are directly supplied while others are transferred from nearby supply shops. All the supply shops must maintain an equilibrium between supply and demand and offer good service so that more means of production can be transferred, and commodity circulation on the market and turnover of funds can be accelerated. Second, regulate supply and demand by using the law of value. In order to keep abreast of the three types of means of production, it is necessary to carry out three kinds of price control system, namely prices fixed by the state, floating prices and free prices. Prices fixed by the state should be regularly readjusted in accordance with changes in supply and demand. Third, the circulation of the means of production should be promoted according to different economic regions and irrational links for commodity circulation should be reduced. Specialized companies or supply shops for the means of production must be set up in accordance with economic regions centered in the cities and it is necessary to provide supplies for the nearby production units or inhabitants and change the circulation systems which are divided by administrative departments or administrative regions into unified markets under socialism. Fourth, the specialized companies or supply shops of the commercial departments for the means of production should be developed into specialized commercial enterprises thus gaining initiative in business management. At the same time, the markets for the means of production should be run seriously. All production enterprises, no matter whether they are run by the whole people or the collective, or whether they be specialized companies or supply shops of the commercial departments for the means of production, can carry out transactions on the market, purchase freely and operate outside their own areas, thus enlivening the commodity circulation of the means of production.

MERGING OF MAANSHAN STEEL ENTERPRISES DISCUSSED

HK150910 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 10, 15 Oct 80 pp 35-36

[Article by Lin Qiongquan [2651 3890 3123], Liu Xingli [0941 5281 0448] and Gui Yuming [2710 3768 2494]: "Three Factories Merge Into One and Develop Production Drastically--Before and After Merging of Three Steel Enterprises in Maanshan"]

[Text] There are three steel enterprises in Maanshan Municipal District; a big one, a medium-sized one and a small one. The first is the Maanshan Iron and Steel Company with a history dating back 40 years. It is one of the 10 biggest steel factories in China; the second is Zihu Municipal Iron Mill that was set up in 1958 (it first belonged to the company but was later taken over by the province in 1963); and the third is the Maanshan Municipal Iron and Steel Plant which was built in 1969 and began production in 1970. The three enterprises are situated in the same city, engaged in the same trade and are contiguous. Now the three units have merged into a single entity.

The Reasons for Merging

In early 1978 a merger between the Zihu Iron Mill and the Maanshan Iron and Steel Company was considered because when the province took over the Zihu Iron Mill it had four furnaces with a capacity of 72 to 74 cubic meters. Following the patternof "small and complete," the mill built a 25-aperture coke oven and an 18-square meters sintering machine in a bid to produce 200,000 tons of iron a year. From 1963 to April 1978, its total investment came to 23.79 million yuan. But it achieved half the result with twice the effort and suffered a deficit for years. From 1969 when it resumed production to theend of April 1978, when it was officially merged with the Maanshan Iron and Steel Company, it lost 55.51 million yuan, more than twice the amount invested. Its highest annual output was only 60,000 tons and the tonnage ratio between iron and coke was above 1,000 kilograms (comprehensive coke ratio of the Maanshan Iron and Steel Company last year was 580 kilograms) and its best furnace utilization rate was less than 1. In addition, the Zihu Iron Mill has no material base of its own. Therefore, it had to purchase iron ores and dolomite from other places. It lacked transportation facilities and often sought help from the Maanshan Iron and Steel Company for bringing in raw materials and transporting products off the premises. It was not in a position to undertake comprehensive utilization and recover chemical products. All coke oven gas, blast furnace gas and cinders were discarded. Around 1977 the mill was even harder put to maintain production, let alone promoting production. It was first planned during mass repair and maintenance work in 1977 that the No 4 blast furnace be expanded to 1,000 cubic meters. But the lack of funds was so serious that it failed to even repair the furnace, let alone expand it. Eventually, the No 4 furnace was discarded, leaving three furnaces that were just enough to manage production. This situation has forced people to find another way out. It was under these circumstances that consideration was given to merging the mill with the Maanshan Iron and Steel Company.

The Maanshan Municipal Iron and Steel Plant was built on the former site of a coke oven within the area of the Maanshan Iron and Steel Company. When the building of the plant was under preparation, it was reckoned that the plant could use the leftover bits and pieces (bits of coke and running gates) of the company. The plant was first installed with two furnaces with a capacity of 9.2 cubic meters (later expanded to 20 cubic meters and 14.5 cubic meters respectively).

In 1972 the Maanshan Iron and Steel Plant added a 250 rolling mill [as published] with billets provided by the Maanshan Iron and Steel Company. Yet, it still suffered a deficit. During the 10 years from 1970 to 1979, it lost 6.85 million yuan (excluding political compensation for small furnaces). From 1972 to 1978, the average cost for small-sized materials was 512 yuan per ton. Under this situation and witnessing the changes experienced by the Zihu Iron Mill after it was merged with the Maanshan Iron and Steel Company, the Maanshan Municipal Party Committee decided at the end of 1979 to merge the Maanshan Municipal Iron and Steel Plant with the Maanshan Iron and Steel Company. Thus, the three units merged into a single entity.

The Methods Used

The Zihu mill was officially merged with the Maanshan Iron and Steel Company on 1 May 1978. The provincial and municipal party committees presided over the signing ceremony and the two sides agreed to amalgamate under the following three principles. First, all the fixed assets of the Zihu Iron Mill must be handed over to the Maanshan Iron and Steel Company. Second, the company must supply the province with 80,000 tons of pig iron every year at selling price. Third, all the staff and workers of the Zihu Iron Mill must be transferred to the company with their wages temporarily frozen.

In January this year, the Maanshan Iron and Steel Plant was officially merged with the Maanshan Iron and Steel Company according to the following six principles. 1) Following the merger, the company must supply the municipality for a protracted period with 10,000 tons of pig iron and 10,000 tons of rolled steel every year at selling price with the specification and variety of goods to be decided by the municipality. 2) The fixed assets of the plant must be transferred to the company according to their net value as of the end of 1979 and must be repaid within 2 years with three-fifths of the assets to be repaid by April this year and the rest in the first quarter of 1981. 3) The current funds of the plant must be transferred to the company for its own use. 4) All the staff of the plant must be transferred to the company and must be returned to the municipality by stages to meet the needs of the municipality and when the company itself has set a standard for recruiting workers. 5) The Maanshan Iron and Steel Company must be responsible for all the welfare accorded to retired staff as well as accident compensation. 6) Following final accounts by the end of 1979, all surplus capital construction material must be handed over to the company after deducting the materials owed as debts to other units.

The Results

The merging of companies is a good measure because it has helped develop production drastically and beyond expectation. After its merger with Maanshan Steel, the Zihu Iron Mill changed its name to the Third Maanshan Steel Iron-Smelting Plant. It suspended production for 4 months from August last year to carry out restructuring work. The 25-aperture coke oven that caused debts for many years was dismantled. The three furnaces were restructured to specialize in producing ferromanganese with an annual capacity of 30,000 tons. In May this year, the furnaces turned out 2,273 tons of ferromanganese with the cost per ton dropping from 1,117 yuan in January this year to 712 yuan, a decrease of 26.2 percent. Consumption of raw materials also decreased. The utilization rate of manganese increased from 66 percent to 74 percent. Iron ore consumption dropped from 3.9 tons to 3.3 tons. In April this year, profits amounted to 100,000 yuan, followed by 146,000 yuan of profits in May. In the past, gas was wasted. The plant has been producing enormous quantities of gas (8,000 cubic meters per hour). Therefore, the company plans to lay pipes for transporting the gas to the blast furnace of a rolling mill.

The Maanshan Municipal Iron and Steel Plant changed its name to Small Rolling Plant of the Maanshan Iron and Steel Company. The small furnaces were restructured into blast furnaces and the plant consequently stopped producing pig iron. The processing technology of the existing rolling machines was readjusted while heavy manual work was replaced by mechanization and automation. This plant mainly produces 50,000 tons of 8 to 14 millimeters steel rods and threaded steel urgently needed by the state each year. The company has decided to use the former site of the dismantled furnace to build a workshop with an annual capacity of 200,000 tons of small-sized materials. The workshop will be installed with equipment made by the company itself. The project was started in July this year and is expected to be completed by the end of next year. It was planned that 3 years after the workshop began operation, its capacity would be increased to 250,000 tons to enable the company to rectify the situation whereby the amount of materials used exceeds the quantity of steel produced. In the first half of 1980, this rolling plant produced 17,000 tons of materials with costs decreasing every month. It made 2.138 million yuan profit in the first 5 months.

The merging of the three enterprises also promotes the production of a number of industrial enterprises in the city. The Maanshan Municipal Party Committee has decided to invest 3 million yuan from the fixed assets of the former Municipal Iron and Steel Plant that were paid by the company this year in light industry, textile industry and the construction material industry. Of this amount, one-third will be used in the leather, garment and textile industries.

The merger has achieved drastic economic results because: 1) The enterprises proceeded from their own reality and made a clean break with the business method of seeking a system of "small and complete"; 2) The overall arrangement of production is rational and avoids duplication in construction and production and encourages each unit to fully display its productivity, and 3) Resources are used rationally.

PROTECTION OF ENVIRONMENT, RESOURCES DISCUSSED

HK220438 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 10, 15 Oct 80 pp 28-29, 39

[Article by Ma Shijun [7406 0013 7486], chairman of the Chinese Physiology Society and committee member of the Chinese Environmental society; Yang Hanxi [7122 0698 3556], secretary of the State Committee of Man and the Biosphere of the People's Republic of China and committee member of the Chinese Forestry Society; and Chang Shuzhong [1728 2885 0022], chairman of the China side of the Associated Committee of the China and World Wildlife Foundation: "It Is of Immediate Urgency To Protect Our Environment and Natural Resources"]

[Text] Editor's Note: The following article is jointly presented by some famous Chinese environmentalists and physiologists to draw attention to the above issue and to make suggestions. It should be highly appreciated by the departments and production enterprises concerned. Our natural environment is the material foundation of our economic development. Even our ancestors realized the stupidity of "draining the pond to catch fish" and "killing the goose that lays the golden egg," how can we not take the protection of the environment and our natural resources into consideration when we are carrying out the modernization process. To protect our natural environment first, we should prevent pollution and second, we should reasonably exploit the natural resources. This issue concerns not only our present economic life but also the interests of our descendants. Our socialist system has created for us the greatest possibility for coordination of the state's economic activities on the basis of all-round and long-term interests. The state should avoid direct control of the activities of economic units which should be encouraged to take an active and enthusiastic role. Only in this way can the economy be enlivened. But this does not imply that the different districts, departments and economic units can have complete freedom to do what they want. On some questions which involve the entire national and long-term interest, this is where our socialist economic system should make use of its advantages of centralized planning and uniform control. The protection of the environment and natural resources is an issue that urgently requires comprehensive regularization, legislation and tighter control by the state. This is indeed a matter of immediate urgency. [end editor's note]

Man's natural environment consists of an assortment of natural elements which surround us: the sun, the atmosphere, water, soil, living organisms and rocks. They are the fundamental resources for human survival and production. Environmental protection really entails the prevention of pollution and the protection and appropriate exploitation of natural resources.

Our country is huge in area and rich in resources. But since the founding of the People's Republic, the natural resources in some districts have been seriously damaged because of misguidance, problems in interpretation of ideology and defects in the management system. The extent of forest cover in our country ranks 120th in the world. In other words, we are lacking in natural forest. However, each year, about 200 million square meters of forest are consumed. Two-thirds of the figure is due to overcutting, woodland clearance and forest fires. From 1956-1965, an annual average of 16 million animal furs and skins were harvested. But now, it is only just over 7 million. Since liberation, about 10 species of wild animals have become extinct or virtually extinct, including wild horses, high-nose antelopes, a red species of threskiornis aethiopica melanocephala and so forth. More than 20 species are nearly extinct, including the long-armed gibbon, hill deer and the white-fin dolphin. The total area of grassland which can be used is over 3.3 billion mu but of this, over 700 million mu yields less than half of its former quantity of grass because it contains too much sand, has degenerated or is too saline. Each year, between winter and spring, the loss of meat caused by death and sickness of farm animals due to inadequate fodder is way in excess of the total amount purchased by the state. In the 1970's, the catch of fresh water fish was less than one-half that of the 1950's. The comparatively serious erosion of soil by water amounts to 1.5 million square kilometers. This is about one-sixth of our country's total surface area. The Huang He and Changjiang together carry away 2.6 billion tons of soil a year. This is equivalent to 6 million mu of good land. Since liberation, the surface area of land that has reverted to desert has increased by nearly 65,000 square kilometers (nearly 100 million mu). Of this, 91 percent has been caused by improper human economic activities. Because of the lack of unified management and proper planning, the amount of waste and damage inflicted on water and mineral resources has also been astonishing.

The natural environment is an organic entity in which each element is mutually connected, regulated and transformed. These connections and changes all occur according to predetermined natural laws (principally physiological laws) and are not subject to man's will. For example, overcutting in the upper reaches of a river may cause soil erosion in the lower reaches. Sedimentation may raise the river bed and result in flooding. Moreover, some forest animals may also disappear. Again, if physiological laws are not taken into consideration when dams are built for generating power this may obstruct the coming and going of marine life and cause the extinction of some valuable fish. It may also result in inadequate water supply in the lower reaches so that fields lack irrigation.

To take another example, if we indiscriminately reclaim land from lakes to grow more grain but the climate becomes drier, this can still cause a decline in production in fields over a wide area, including the fields around the lake. At the same time, the lake's ability to resist drought and flood may also be reduced. Moreover, the fishery resources and reeds used for making paper may also cease to exist. Many examples of this sort of problem can be cited.

Hence, there should be coordinated investigation into environmental protection and an overall plan should be devised. But now, the fact is that the whole body of our natural environment has been cut up and mined. The different production departments and the different districts consider only their own interests when utilizing natural resources. They care only about exploitation but not about protection, stress development but neglect management and they only get what they want without considering the situation as a whole or long-term benefits. Their views are partial and short-sighted. They do not adopt a scientific attitude towards the state's valuable resources and cause serious destruction of the country's natural environment. This has and will continue to cause heavy losses to industrial and agricultural production. Because of the continuous development of production, we may expect greater and more permanent changes in our environment accompanied by a much greater demand for natural resources. Hence, how to reasonably exploit our natural resources to the greatest extent is a very important topic which should be discussed during the process of modernization. For those resources which can be replenished, protection and reproduction are the bases of exploitation. The rate of consumption should be smaller than the rate of replenishment. Only this can insure that the resources will increase in quantity and improve in quality. Otherwise, we are 'draining the pond for fish' and causing damage even to our descendents. Our state has plans for management of the economy. The present damage to resources shows that there is a serious imbalance between the consumption of resources and the protection and management of them. During the present period of adjustment, this issue should receive serious attention. We should lay off renewable resources and give them the opportunity to flourish and recuperate. Those that cannot be replenished should be exploited with coordination among the different departments and also be put under scientific management. Therefore, to strengthen the protection of our natural environment is an urgent task during the present process of economic development. Our suggestions are as follows:

1. Under the leadership of the Central Government, the different departments responsible for planning should set up practical rules to protect, replenish (in the case of renewable resources) and enrich our natural resources. The departments concerned with development and consumption should at the same time have appropriate plans for the protection and rational utilization of natural resources. Environmental protection departments should participate in the formulation of rules and plans.

2. Each production department should set up and strengthen organs for the protection and management of resources. At present, in many departments and headquarters, the above task is only looked after by small sections with only executive power. Some departments do not even have anybody who is responsible for this task. Departments such as forestry, animal husbandry, agriculture, marine production, coal mining and metallurgy should each be responsible for the protection of forest, grassland, farmland, marine and mineral resources.

3. When carrying out the development of natural resources and constructing large-scale industrial projects, we should also evaluate their effect on the physiological system of our natural environment. Large-scale projects such as the building of the Three Gorges Reservoir, the direction of water

from south to north, and the development of the Three River Plain will have an enormous influence on our natural environment. In order to predict and control such influence, it is of vital importance to begin evaluation work on the quality of our environment. This will also enable us to remedy any possible damage to our natural development.

4. When a question concerns many departments, when it has a great effect on our natural environment and where there is no unified and powerful management department in charge, it should be brought under the control of the Environmental Management Department which should adopt an active role. Questions concerning soil, water and wildlife and the setting up of national conservation areas are some examples. The reasons are: 1) The production departments, though they should play the dual role of exploitation and protection of resources, tend to care only for the former, and neglect the latter. They do not realize that protection is for the sake of prolonged exploitation. They usually do not comprehend the serious consequences of continuous damage to our environment caused by inappropriate exploitation of resources. 2) Interfering with the physiological cycle will affect many departments and may cause imbalance and maladjustment in the production department. Take land as an example. The Agriculture and Plowing Department blindly clears forests and grassland. This may lead to bad windstorms and serious soil erosion. This will affect agriculture, forestry, animal husbandry, water supply and transportation. Projects undertaken by transportation, industry and other basic construction may unreasonably occupy land, thus affecting agriculture, city planning, transportation and industry and other departments concerned. To reclaim arable land from the lake will damage marine resources and reduce the water surface area. This will involve the Marine Product and Water Supply Department. Because of that, rational exploitation of land resources concerns many departments. Hence, it needs coordination in both professional knowledge and scientific management techniques. 3) The Environmental Protection Department should act as an organ for organization, coordination and balance among the different departments. It treats the environment as an entity and considers the different aspects that can influence the natural environment. We should begin with the question of appropriate exploitation of natural resources, and carry on the positive task of maintaining the equilibrium of the physiological cycle. Only thus can we achieve the aims of protecting our environment, prolonging the life of our natural resources and fully developing the national economy.

DISCUSSION ON TURNING BUREAUCRATS INTO MANAGERS

HK170214 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 11, 15 Nov 80 pp 3-8, 40

[Article by Wan Xiang [1360 6763]: "From Bureaucrat to Manager"]

[Text] (I)

In order to speed up the tempo in realizing the four modernizations, important reforms are being progressively carried out in the economic management system in our country. The key problem in the reforms is still the transformation of people. That is to say, the kind of bureaucratic leadership in the past must be discarded. It must be exchanged for modern leadership by managers. Therefore, I wish to air my personal views on this problem.

The word bureaucrat is not a bad word in several foreign languages. It generally refers to government administrative personnel. Before the 19th century the word was broadly used. In the early 20th century, it had both a commendatory and a derogatory connotation. After World War II, the derogatory connotation superceded the commendatory one, but the commendatory sense was still retained. For example, in the West and Japan, to call someone a bureaucrat was not necessarily derogatory. It merely showed his status.

From the viewpoint of Western politics, bureaucrats are indispensable in any country. What counts is whether they are good or bad and whether they practice bureaucracy or genuinely do their own jobs in the interests of the country. We have recently done some study into the history of the modernization of several countries such as Japan and the Soviet Union and discovered that when they started their modernization, the number of bureaucrats was insufficient and had to be supplemented.

Let us take Japan for example. During the Meiji Restoration, the chief bureaucrats were drawn from the samurai. At that time, there were only 10,000 or so samurai. They were in fact ruling bureaucrats replacing feudal lords. By the time Japan started its modernization, the number of bureaucrats was insufficient. So a large number of minor feudal lords were recruited as bureaucrats. Thus, the stratum of bureaucrats increased from 10,000 people to 40,000 and then 50,000. The development of the modernization of Japan depended on these people. At the same time, Japan took some new measures to train a new stratum of bureaucrats. This shows that in the division of work in society, the profession of bureaucrats exists. In the early stage of the course of modernization, this profession is indispensable. Later on, Japan gradually discovered that the strata of samurai, minor feudal lords and small gentry could not completely meet the needs of the development of modernization. Although new bureaucrats were being trained, there were still not enough. Japan was a capitalist society. If the enterprises were not run properly, it was bound to come to grief. This forced the bureaucrats and samurai to remold themselves conscientiously and turn themselves into better bureaucrats to lead modernized enterprises. It was because of this that Japan's capitalism at that time was strongly tainted with feudalism.

Besides, Japan at that time exercised an imperial policy and forcibly took over the markets in Korea, Taiwan, Southeast Asia and the greater part of the Chinese mainland. Even though the products they produced were not good, they could still resort to military and political measures to pursue their economic and trading policies in order to stimulate domestic economic development. Therefore, although Japan's bureaucrats were no good, they were still able to complete the modernization at that time.

After World War II, the American army occupied Japan. The American occupation administration took many measures such as carrying out land reform on a large scale, disbanding financial magnates and introducing the Western democratic system to weaken the imperial system acting in concert with the Japanese feudal system. This greatly reduced the feudal characteristics of Japan's capitalist system, enhancing the rapid development of Japan's capitalism. Simultaneously, the American occupation administration also took measures to reform the semifeudal bureaucrats in Japan, especially to dismiss all important managing staff in enterprises who were connected with old financial magnates. Large numbers of intellectuals returned from Europe and America, and petty intellectuals were substituted in place of the former feudal and semifeudal management personnel. After passing through a reform period of almost 30 years after the war, the present management personnel in Japan can be said to have been modernized. This accounts for the rapidity with which Japan's economic modernization is developing at present.

The modernization of the Soviet Union started in Lenin's time. It also found that there were not enough leaders, so some intellectuals and managing personnel of the czar's time had to be reinstated to lead the economic construction of the whole country. But at that time Lenin had already noticed the development of bureaucratism and hated it bitterly. Four or five years before his death, he continuously mentioned, in each of his articles concerning the economy, the necessity of guarding against bureaucratism. The modernization being carried out in the Soviet Union at that time adopted the capitalist method of large-scale production in enterprises and adopted the management methods of the capitalist Taylor system [Frederick Winslow Taylor (1856-1915), Pennsylvania and New Hampshire-educated inventor and engineer known as father of modern economic management] in the management of workers, but everything was controlled by central government planning. This could not but increase the number of bureaucrats. Even during the time of Lenin, the number of bureaucrats grew very fast. Lenin saw that it was very dangerous to let bureaucratism proliferate like that without controlling it. Therefore, it was mentioned in many articles that bureaucratism should be opposed, the bureaucratic system should be changed and this should be done when the time was ripe. After Stalin succeeded Lenin, he did not act according to Lenin's desire in his life time. It turned out that the number of bureaucrats grew even larger and the bureaucratic system was even further consolidated. Nowadays, the number of people in the industrial bureaucrat group controlled by the Soviet Union amounts to about 600,000. If the military and administrative bureaucrats are added, the number is even greater.

Another big problem in the Soviet Union is the problem of workers' rights. In Lenin's time, staff members and workers in the Soviet Union still had the right to a say in the management of the economy. In Stalin's time, the system of one-man leadership was practiced, turning rule over the economy into something like a pyramid. The workers' right to speak gradually diminished and now they are practically without any right to speak. In Lenin's time, great importance was attached to the function of supervision of staff members and workers' congresses. In Stalin's time, the power of staff members and workers' congresses diminished. After the 1930's, the workers were practically deprived of the right to speak and the right of supervision from below disappeared.

In comparing the bureaucratic systems of Japan and the Soviet Union, we can see that the way of developing bureaucrats in the Soviet Union was quite different from that in Japan. After the protracted rule of the American army of occupation, the new bureaucrats managing the economy in Japan were attuned to the demands of the development of a capitalist economy. Whereas, in the Soviet Union, neother a comparatively good and effective format for the development of the socialist economy was established nor did a great number of administrative and management personnel really au fait with the demands of the development of a socialist economy emerge, that is to say, a new stratum of bureaucrats for the management of a socialist economy. Therefore, the economic development of the Soviet Union could only stagnate.

Over the past 20 years, the Soviet Union has discovered the seriousness of this problem and is carrying out some reforms. But these reforms have been fettered by dogmatism. To date, no fundamental changes have taken place. The system is still the one established in Stalin's time, in which bureaucrats control the economic life. Its method of administration and management is still the old method of administration and management of issuing administrative orders and is not carried out by using various kinds of economic levers to guide the development of the economy. In the Soviet Union, there is a faction of people who have some new ideas. They think that their set of centralized state power and control by administrative decree is still correct. What should be done is simply to employ more of the new discoveries in science and technology like computers to help improve the centralized controls. They consider that not only should centralized control not be weakened, but also that a computer network should be built throughout the country capable of quickly collecting and analyzing the situation throughout the country so as to perfect the policy of centralized control.

From the above comparison, it can be seen that Japan is progressively turning its bureaucrats into managers of enterprises and establishments, but that the Soviet Union wants to employ computers to strengthen bureaucratic centralized control. Evidently, the method of the Soviet Union will not succeed. Its economic stagnation will continue.

(II)

Let us talk about China. The bureaucratic system of economic management in China is the worst and the most backward in the world. I think there are subjective and objective reasons. The subjective reason is the human factor and the objective reason is a question of system.

Let us first talk about the subjective reason: First, the great majority of the chief persons managing enterprises are laymen. According to an investigation made by the Liaoning economic committee, only about 20 percent of the people in the leading groups of the provincial industry and communications enterprises understand their professions. Even in Anshan which has a better foundation in enterprise management, expert leaders make up only about 30 percent of the members of the leading groups. The No 1 Machinery and Electricity Bureau of Shanghai has investigated 2,000 production management cadres in 64 key enterprises, of them only 16 persons are university and college graduates, that is to say, only 16 persons know some theory and have practical experience, amounting to 0.8 percent. The No 1 Machinery Department has investigated 249 key enterprises and has obtained statistics of cadres at factory level in more than 2,400 factories. Among them factory directors with primary and junior middle school education amount to 64.3 percent. Factory directors with senior middle school and college levels amount to 21.4 percent. Factory directors with a university level of education amount to 14.3 percent. The great majority of leading cadres in enterprises like these, including those with a university level of education, have not made a systematic study of enterprise management. They do not understand modern scientific management. Some even lack basic professional knowledge. Shanghai and Liaoning are two of the most solid industrial foundations in our country. If this is what the level of management personnel is like there, we can well imagine what it must be like elsewhere. This situation is evidently the direct, disastrous effect of the erroneous theory of "laymen all along leading experts" over the past 20 years or more, which resorted to lame arguments. It should definitely not be allowed to continue.

Second, as far as the chief management personnel themselves are concerned, they are chief management personnel of enterprises but they do not devote time and energy to learning the relevant professional knowledge and knowledge of management techniques. They rely entirely on their past experience of being senior officers and leading cadres to "command" (but not to manage) economic construction. Some senior officers are good at carrying on political movements while others are accustomed to compelling others to act recklessly. When they come to new posts they do not reeducate themselves and do not change themselves from laymen into experts. Their way of thinking and working methods are the same old stuff. They do not calculate economic costs, do not care about economic results and do not give consideration to normal production order. They frequently use "putting politics in command," "doing political accounts" and "paying some school fees is truly fair and reasonable" and so on to defend their actions. They mechanically use political movements with a terrific din and mass campaigns regardless of manpower and materials in administering and managing economic undertakings, labeling them as "advanced" and "following the mass line." How can they avoid making mistakes? Incidents like "Bohai No 2" are by no means accidental and are not rare.

Third, they do not study, do not read newspapers and are completely divorced from reality. Although they have been involved in economic work for many years, they are still laymen in economic policies and economic decrees. Some have been factory directors and managers for many years. To this day, they cannot explain clearly what the eight specific economic targets are. These comrades are content to rest on their laurels, looking upon enterprises--such important economic undertakings of the country--as places for drawing official salaries and for enjoyment. They do not care about enterprises losing money, nor are they distressed by waste in production and construction. They drift along aimlessly relying entirely on their being old-timers. Formalism is very serious and extravagance and waste are also very serious. Rules and regulations are only followed mechanically.

Fourth, ideologically speaking, they care first and foremost about not losing their official positions. They pay attention only to what their superiors think of them, but they never care about the situation of the market. They do not pay attention to the variety, specifications or quality of the products. They disregard the question of profit in their factories. They simply use "fulfilling plans" and words like "overfulfilling plans" to protect themselves. They even make false reports. Such is the case in industrial enterprises and it is the same in agriculture. For example in Xiyang, they made false reports to win the praise of their superiors so that they themselves could be promoted and make a fortune. They completely neglected the livelihood of the masses of the people and never considered economic efficiency.

Fifth, they put fear before everything. No matter what the matter may be, they ask for instructions and make reports. They kick problems to be solved back and forth like a ball, without any ideas or thoughts of their own. A most typical example is the event of the Xian ball factory exposed by the press. They never make decisions on any problems but await the ideas of their superiors. They do not even handle matters which are within their functions and powers but submit them to the party committees for discussion. They fail completely to fulfill their duties as managers. Here we are not ready to mention other problems like the dilatory style of work, red tape and so forth.

(III)

Now let us talk about the objective reason. This is the problem of the economic management system.

First, government administration is not separated from enterprises and communes. The party is not separated from enterprises and communes. This then turns enterprises and communes, which are economic units, into appendages of party and government organs. Our country's economic system has been shifting back and forth from "stripes" leadership to "patches" leadership. It has never changed its nature of enterprises being under the leadership of government administrative organs. "Stripes" refers to the administrative leadership of central leading organs and "patches" refers to leadership of local government administrative organs over enterprises. At present, everybody is still talking about "combining government administration and people's communes," and the phenomenon of schools and factories "running society" has not yet been removed. Of course, it is difficult to have it removed at one stroke, but the problem must be solved in this direction. The outcome of investing administrative organizations with the power to administer powerless economic organizations is bound to be that whole sets of methods adopted by government administrative organs will permeate into enterprises giving rise to "official factories," "official commerce" and "official agriculture" and so on.

Second, whether the system of factory directors assuming responsibility is good or not should be studied seriously. I consider the system a great hindrance to the development of our enterprises. The leader is a nonprofessional. He has power but he is not able to assume responsibility, and those who actually shoulder the responsibility are without power. With the so-called factory directors assuming the responsibility under the factory party committee, nobody can work well and nobody carries on the work. The outcome is that the party does not lead properly and the enterprises do not lead properly. It is high time that this system of factory directors assuming the responsibility under the leadership of the party committee was changed.

Third, the highly centralized planned management system deprives enterprises of the right to decide for themselves, binds leaders of enterprises hand and foot and stifles their initiative and creative spirit. In production, enterprises have to fulfill or overfulfill production plans assigned by the government. Leaders of enterprises hold themselves responsible only to plans from upper levels but not to factories, users or society. Whether things produced meet the needs of society or not does not concern enterprises and enterprises do not care. Such a system gives rise to the following. There may be 19 million tons of steel goods in store, but it is impossible to buy steel goods badly needed by society, and a large amount of foreign exchange has to be spent in importing steel goods each year. In the distribution of goods and materials, the state adopts the method of monopolizing purchase and marketing. Enterprises have not the slightest decisionmaking powers in handling goods and materials. All materials needed for production by enterprises are distributed by the state. No matter how unsuitable they may be, the enterprises have no choice. All commodity goods and materials produced are taken away by commercial departments. A steel plant even has to apply to goods and materials departments for steel products needed for its maintenance. Such a rigid system of distributing goods and materials, in which production is divorced from necessity and enterprises are divorced from marketing, not only causes great losses to our country's economy but also results in leaders of enterprises showing no interest at all in the results of management activities. Usually a manager should be responsible for two main things: one is management and the other is administration. Nowadays a manager never worries whether his products can be sold. In the absence of competition, it is not necessary to carry out market investigation and market forecasts. Neither is it necessary to decide important matters and study the development of new products in accordance with the needs of the market. In this way, the national economy is without vigor and enterprises are without vigor. In finance, we practice state monopoly of revenue and expenditure. This brings a lot of problems in our economic activities. They are: 1) Enterprises are without certain rights of financial expenditure and cannot develop themselves with their own efforts. They cannot develop new products by making use of or acting according to, market demands. This causes enterprises to lose their vigor. 2) Enterprises lack the financial capacity to encourage staff members and workers who have made contributions to the production and management activities of the enterprises. It is difficult to implement or consolidate the principle of working more and receiving more. It is difficult to give play to the enthusiasm of the broad masses of staff members and workers. 3) All profits are turned over to the higher authorities and the government subsidizes losses. There is no significance to whether an enterprise does well or not. This causes leaders of enterprises to lose the spirit of forging ahead to run their enterprises well. Since enterprises lack the internal motive force to run production properly, production cannot be developed rapidly and difficulties in financial sources emerge. Enterprise losses are a rather common phenomenon in our country. In foreign countries, if an enterprise is not managed properly, it is closed. However, the reason why no enterprises are closed in our country is because artificial support is given them. In foreign trade, we monopolize all imports and exports. Enterprises do not know what is needed on the international market, and do not know quotations there. They receive no information about advanced technology. They are in a state of complete isolation from the world. It is impossible for an enterprise without internal motive force and external pressure to improve its products and to raise the competitiveness of its products on the international market. In enterprises without external pressure of competition, without internal motive force to run the enterprises well, and without the right to decide for themselves, it is very difficult to train large numbers of management personnel. As some comrades have pointed out, even the very best enterprise management personnel cannot give play to their wisdom in China's enterprises, nor can they run them well; and the worst and useless enterprise leaders can live in ease and comfort there.

Fourth, the cadre management system also quickens the government administrative character of enterprise leadership groups. In allocating leading cadres to enterprises, whether they are experts or not is not considered as the fundamental criterion. Seniority is arranged according to records of service. If one is at a certain level, one is destined to be a leader at that level. A newly demobilized deputy regimental commander who had never worked in industrial or commercial enterprises before was assigned to a machinery factory in Shanghai with over 3,000 employees. The only reason for doing so was because his record of service placed him at that level. This equates economic work with work in the army and government administrative work. All cadres are state officials. They are at a certain level and they are appointed as officials at that level, regardless of the necessary criteria for enterprise management personnel. Since the systems of appointment used for enterprise management personnel and government administrative personnel are similar, a great deal of government administrative cadres are assigned to assume a leading role in enterprises. In enterprise leadership groups in our country, the ratio of lay cadres sent from the army, and from central or local government administrative units is very high. Naturally, the ways and methods used for government administration are brought to enterprises and things going against the laws of economics are bound to happen. Since enterprises are entitled to the same level as government administrative departments, leaders in some enterprises try hard to show off in accordance with the government administrative level by making their factories look more extravagant and grander. The phenomenon of enterprises being overstaffed has much to do with this. Furthermore, the erroneous guiding idea of "laymen all along leading experts" and frequent political movements prevent leading personnel in enterprises from trying conscientiously to turn themselves into experts. Under certain historical conditions, it is permissible and possible for "laymen to lead experts" but it is wrong to say "all along" it has been done.

Fifth, there is little democracy in factories. It is impossible to run and manage enterprises well without democracy. To be a good manager, self-motivation is needed, and at the same time, there must be supervision from below. Even in the Western countries, the enterprise workers' right to have a say is stressed in varying degrees. In countries with comparatively well-developed economies like Sweden, West Germany and Japan, the workers participate in the management or they have a considerable say. The slogan of "two participations, one reform, and three cooperations [cadre participation in productive labor and worker participation in management; reform of irrational and outmoded rules and regulations; close cooperation among workers, cadres and technicians] was originally put forth by Comrade Mao Zedong, but we have not implemented it properly. It was taken to Japan and has been realized to a certain extent in enterprises there.

(iv)

The combined action of the subjective and objective factors mentioned above has reduced our entire economy to a state of rigidity. An American economist, after comparing the existing socialism with capitalism, made some remarks which are worth serious consideration. He said, "People in socialist countries say that the capitalist system will inevitably perish. This may be right. But I think it will not perish immediately. On the contrary, it will still develop to a certain extent. The main reason is that its cells are still alive and have vitality. These cells are our enterprises. They have vigor and competitive power and can weather storms. People go on and on about how wonderful the socialist system is. However, from the Soviet Union to China, I have discovered that your cells--enterprises--are rigid, without vigor and unable to withstand competition. This does not seem good because it cannot withstand a storm." Another American economist who has been in China said, "The equipment in China's factories is not bad. If the management methods in factories are changed properly, and the mental attitude of the workers and especially that of the enterprise management personnel are changed, the potential of the factories will be more realizable. At present, your enterprises lack vigor and are too constrained by rules and regulations. In addition, they are managed by people who are unable to adapt to the competitive situation in the world today, cannot adapt to the tremendous changes taking place on a global scale and cannot give play to the superiority of socialism. The reform of the economic management system must start here." One of our cells is the countryside and the other is the enterprises. Now we must adopt various methods to enliven them. Otherwise the reform of the economic system is hopeless.

How can we attain this? Personally, I think five changes should be made:

1. Enterprises must be changed from a pure production pattern to a managed production pattern. In the past, production was the only thing an enterprise did. It never concerned itself with the purpose of production. If an enterprise produces purely for the sake of production, it will easily become ossified. If production is changed to a managed pattern, a thoroughgoing change will immediately take place in our enterprises. We must have production of a managed pattern, must continuously improve our products and must study and strive for economic results. It will not do if we simply produce several big steel ingots and put them on display when we are asked by the government to produce a certain amount of steel. We must carry out production to manage and develop the economic cause of the whole country and to develop our own undertakings. Only in this way can we continuously set new demands for enterprise management personnel and force them to take a new attitude toward production and to adopt new methods of organizing production. This will also force them to pay attention to changes on market and to learn to compete.

2. Enterprises must be changed from units which merely carry out orders into units which make their own decisions. In the past, plans were decrees and everything had to be done according to plans. This left loopholes for people to exploit. If you asked me to produce a certain amount of steel, I would produce that amount of steel ingots. Whether they were needed or not I did not care. Anyhow, in quantity, the plan was fulfilled. Enterprises cannot just carry out orders. Changes are also needed in our planning system. Plans can only be for reference. They can never be decrees. Enterprises should be allowed to make their own policies under the guidance of the state plan. This change is very important. It requires enterprise management personnel not only to possess common management knowledge but to be able to

make a concise assessment of the market situation and to formulate correct policies. This actually places the prospects for development of an enterprise on the shoulders of the manager and not on the state plan. The state can only guide and cannot look upon enterprises merely as organs to carry out its orders.

3. Enterprises must be changed from organs without internal or external pressure into organs with internal and external pressure. Internal pressure is to link the good or bad management of an enterprise closely with the direct interests (such as wages and bonuses) of the staff members and workers. Then there will be internal motivation. On the basis of democratic management, everyone will try their best to run the enterprise well. Externally, there must be competition. Competition is the outside pressure. Without some pressure, things cannot be done well. Pressure pushes undertakings ahead.

4. The present command pattern for the economy (where everything is done according to instructions from above) must be changed for a democratic pattern. The personnel relations in modern enterprises are more complicated than ever before. Whether production is handled well, whether it is increasing and whether relations are coordinated well or badly are all extremely complicated. They require the manager of an enterprise to do a good job of organization. While visiting the United States and Japan, I felt that really big enterprises (big and complete) were rare. In most cases there were numerous medium and small enterprises surrounding a big one and serving it. Why do they pay attention to these medium and small factories? They said that medium and small factories have many advantages: 1) The flexibility of medium and small factories is great. They can be changed as their products are continuously improved. The cycle is short and the expenses small. Products can be frequently updated. This helps in competition. 2) Medium and small factories involve less risk and the capital can be used more freely. 3) Here many technical tests can be carried out to expedite the emergence of new techniques. 4) It is easier to handle personnel relations. The factories are smaller and there are fewer people. Managers and workers get along well. We have set up so many big and complete factories in our country. It is better to have more medium and small enterprises and at the same time to handle properly the relation between specialized trades and coordination.

5. The situation of ignoring science and technology and ignoring knowledge must be changed into a situation of attaching importance to knowledge and technology. Enterprises must be gradually changed from the labor-intensive pattern to the technology-intensive pattern. Some foreigners who have visited China say that our machines and equipment are not bad, but, of course, there is still room for improvement. At present, how to give full play to the efficiency of them is not just a problem of utilizing them but also a problem of fully mobilizing people's enthusiasm and initiative to give full play to the efficiency of the machinery. It is a world tendency to change enterprises from the labor-intensive pattern to the knowledge-intensive pattern. In this way our managers can no longer ignore science and technology or ignore knowledge, but have to increase their knowledge before they are qualified to be managers and are able to adapt to the developments of our time.

Only if the above five changes are put into effect in our enterprises can our present bureaucrats be changed into managers. Of course, I mean good bureaucrats with a strong enterprising spirit. As long as they have the inclination to do something and the environments for them to do such a thing is objectively provided, and as long as they work in a thoroughgoing manner in the direction of the five changes, I believe a great number of our comrades can be changed from bureaucrats into managers.

(V)

What are the criteria for a manager of a socialist enterprise? My personal view is that he must at least possess the following points:

1. He must have a strong, revolutionary and enterprising spirit, love his own job and be willing to devote himself to the four modernizations. As a manager, he must be eager to forge ahead, be content with his own job, wise and able to make good judgment, strive for high efficiency in his work and actively push his enterprise forward. He must be able to make full use of objective conditions to change the production conditions of the enterprise in order to create more wealth for the socialist society. This enterprising spirit includes the spirit to learn modestly. He neither relies on the authority of his superior in his work, nor does he take his cue from his superior, but he actively carries out the state plan according to the guidance of the state plan.

2. He must be highly capable of carrying out organizational and leadership work, and must have acute powers of judgment. He must be able to utilize his capacity of logical thinking to systematically analyze the cause and effect of each matter. He must carefully observe the situation of the market economy. He must keep abreast of technical and economic information. must be able to deduce regular developments from it and must be able to make correct judgment and policies. While reforms are being carried out in our economic system, the production in enterprises must not only suit the ever-changing needs of the domestic market but must also suit the needs of the international market. Management personnel must be ideologically prepared to adapt to change, must be capable of adapting to change and must set up scientific research organizations in enterprises and institutes for adapting the enterprises to the changes. They must link up internal production with scientific research and must adjust manpower, material resources and financial resources on a timely basis according to market fluctuations so as to produce products badly needed on the market. He must also be able to organize the enterprise to carry out management activities. The manager of a big enterprise must be broadminded. He must possess both national and international management knowledge. Proceeding from a broad scope, he must effectively organize and lead the work of market surveying and forecasting, and the work of formulating administration and management policy. He must also be able to launch a comprehensive technical service and collection of data to improve the products, and to continuously raise the competitiveness of the products at home and abroad. One very important point also included in the ability to conduct organizational work is to practice democracy within enterprises.

Shortly after liberation, great importance was attached to staff members and workers' representative rallies, but later on they were gradually overlooked. Democracy within enterprises is very important. It can make staff members and workers feel that they are members of the enterprises and inspire them to dedicate their lives to the enterprises. The manager of an enterprise should know how to rely on the masses of the people and mobilize them to run the enterprise well. Besides the motivation of material interest, there must also be the guarantee of democracy in politics.

3. He must have profound knowledge and also have knowledge and experience of special trades, that is, he must be an expert in his profession. This is also related to our educational system. I always think that in our educational system, the training of our students in basic knowledge is too poor, and the courses are divided too early and too narrowly. A student after his graduation knows something about the subject he has majored in but knows nothing about anything that goes slightly beyond that. Social science has the same problem. In my contacts with foreign specialists, I have discovered that their basic knowledge is broader and the foundation of knowledge in colleges and high schools is more solid. A manager must have broad knowledge before he can become a man of wide experience and can handle all kinds of concrete problems.

Bureaucrats exercise power from above, but managers depend on their ability and not on power and influence in leading work. Bureaucrats are satisfied with not breaking the law but managers must do everything possible to develop their enterprises. There are great differences between government organs and enterprises. Government administrative functionaries are not the same as management personnel either. If we are to create a course conforming to a Chinese pattern and to enliven our economy, the present method of government administration will not do. If the right of deciding for themselves is extended to the reformation of the system of organization in enterprises, and the state gives guidance to enterprises at the same time, our enterprises can then be developed. In short, turning bureaucrats into managers has become a very important problem at present. And at present, we do not have enough management personnel. Therefore, on the one hand, we must help the existing management personnel to study harder of their own accord and to remold themselves. On the other hand, the party and the government must hasten to take educational measures in training with great efforts, new and young administrative and management personnel. Furthermore, comrades who are doing economic work and those who are not doing economic work, all need to remold themselves and to conscientiously study harder to gain knowledge in current economic management and in modern management. Institutes for acquiring knowledge in economic management must be established and new, outstanding economic management personnel must be trained. The general aim is nothing more than the enlivenment of the cells in China's rural areas and enterprises through modern economic management personnel. Only in this way can the superiority of socialism be given full play and modernization among Chinese lines be realized.

ECONOMIC JOURNAL DISCUSSES INTEGRATION, COMPETITION

HK180411 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 11, 15 Nov 80 pp 9-13

[Article by Ma Hong [7456 3163]: "Integration and Competition in the Socialist Economy (II)"]

[Text] (II)

Competition in the Socialist Economy Has Begun To Show Its Vitality

Integration in the socialist economy can be easily understood by most people. But many are skeptical about competition in socialist economy. There even exists various obstacles to competition. Although competition has met with various obstacles in practice and competitive activities have only recently begun, the situations in many places show that competition plays an active role in our economic activities, and it has demonstrated its vitality.

Competition will help enterprises to produce what is needed in market and overcome the defects of making products that are not needed and of the supply that is divorced from demands. It will force enterprises that are making unsalable products to turn to producing products that are in short supply in the market so that these enterprises will be able to readjust their production quickly to become competitive.

Competition will help enterprises improve economic management, strengthen economic accounting and increase economic results. Through comparison in quality, prices, salability and services in the market, enterprises will strengthen their economic management, improve quality, lower costs and increase profits for the interest of the state, their customers and themselves.

Competition will help enterprises to step up research work, develop new technology, invent new products and constantly increase varieties of their products to enliven the market and meet people's various needs.

It will also help enterprises take the road of coordination and integration and increase labor productivity. Some enterprises, particularly small enterprises with limited conditions and a weak competitive position urgently need specialization and coordination in production. They even demand integration so as to strengthen their competitive position. It is justifiable when some people said that competition is the catalyst for promoting integration among enterprises.

Why Is Competition Necessary in the Socialist System?

Socialist economy is commodity economy under the influence of the law of value. Therefore, basically it needs competition in order to fully display the role of the law of value and promote competition.

Under the condition of commodity production, the role of the law of value is mainly shown in the following two aspects: First, it improves labor productivity. That is to say, it lessens socially needed labor time that is required to produce per unit products. Second, it helps various departments to rationally distribute the labor force and readjust the relations between production and demand. But such role can only be displayed through competition. Experiences in our country and abroad prove that if we prohibit competition and rely solely on readjustment by the planning departments, then we are unlikely to utilize the role of the law of value.

Competition in commodity economy includes competition among producers of commodities (major competition), competition among buyers and competition between producers and buyers of commodities. These three forms of competition have one thing in common, that is commodity prices which are decided by socially needed labor time. Marx said that "different individual values must be averaged into a social value, that is, the above-mentioned market value. Therefore, competition among producers of the same commodities are needed. In addition, a market is needed for the producers to sell their commodities." ("Collected Works by Marx and Engels," Vol 25, pp 201-202) Engels also said: "The role of the law of value in the production of commodities can be implemented and the value of commodities can also be decided by socially needed labor time through fluctuations in competition and fluctuations in the prices of commodities." ("Collected Works by Marx and Engels," Vol 21, p 215) Thus, it is apparent that with competition, the law of value will be able to play its role to help enterprises continually improve labor productivity.

It is because of competition that the law of value helps various production departments rationally distribute the labor force. Engels said the law of value means that supply and demand constantly adapt to each other. Competition causes fluctuations of prices and adjusts production. When prices increase it means that social demand is increasing and production will consequently be increased. Decreases in prices means that social demand in decreasing and production will consequently be affected. Should competition be banned, the law of value will not be able to automatically adjust production. To prohibit competition actually means to hinder the production of commodities and to prevent the law of value from playing its role.

Competition was not allowed in the past when we were following traditional Soviet theory. This theory bans competition and takes the view which regards socialist economy as similar to the natural or seminatural economy of feudal society. Following the revolution, commodity production was considered to no longer exist in the Soviet Union. It was then suggested that commodity production be abolished and military communism be set up. Such view in fact regards socialist economy as natural economy. Stalin later acknowledged that commodity production still exists in socialist society. But on the other hand, he said that the means of production are not commodities and that the role of the law of value is to affect and not to adjust. In fact, such an assertion regards socialist economy as seminatural economy. Practice proved that this assertion does not accord with the law of the development of socialist economy and consequently it can in no way promote the economy.

The majority of the economists and the economic theoretical circles in our country after conducting studies and research and summing up experiences and lessons in our country have acknowledged that the socialist economy is commodity economy. According to their view, both the means of livelihood and the means of production are all commodities and the relations between the ownership by the "whole people" and that of the "collective" and the relations within the "whole people" are all relations concerning commodities. They also hold that the law of value has its role to affect and to adjust and that this law has been used in economic activities. But such views cannot be said to be major progress either in practice or theory. It is natural that some comrades do not agree with such views because of the economic situation in our country. Owing to our backward productivity, our commodity economy is still very weak and it is largely composed of natural economy. Consequently, it is often that people easily hold the view of natural economy and use it in studying and handling problems. Therefore, it is understandable that people hold different views toward developing commodity economy and launching competition. This problem can be solved through investigations, studies and practice.

In short, in order to step up socialist construction it is imperative to develop commodity economy in a big way. But to do this, we must launch competition; otherwise it is impossible to combine planning adjustment and market adjustment as well as to step up the development of our economy.

The Difference Between Socialist Competition and Capitalist Competition

Both socialist competition and capitalist competition have their own roles in promoting labor productivity of enterprises and enabling various production departments to rationally distribute the labor force. But competition has a negative role that cannot be avoided in capitalist society. However, in socialist society we can prevent and overcome this negative role because competition in our country is carried out under public ownership and planned economy while competition in capitalist countries is carried out under capitalist ownership that is coupled with anarchic production.

The competition in socialist economy differs in nature with that in capitalist economy in many aspects.

The participants in competition differ. In capitalist countries it is private enterprises that are taking part in competition. They are carrying out a life and death struggle. But the competition in socialist society is carried out by all enterprises under public ownership. There exists competition among these enterprises but such contradictions are based on a common goal of developing socialist undertakings.

The aims of competition differ. Capitalist competition is carried out for the purpose of making maximum private profits. The aim of socialist competition is also shown in profits, but the ultimate aim of seeking profits is to develop social productivity and on this basis to improve people's material and culture lives.

The methods of competition differ. In capitalist competition, people resort to every means, including fraud, deception, tricks and creating scandals. But socialist competition can only be carried out under socialist principles. All enterprises can strengthen their competitive position only through improving management, carrying out technical renovations and improving labor productivity.

Restrictions in competition differ. In any social system, competition is restricted to some extent. Capitalist competition is mainly restricted by monopoly capital. Socialist competition is mainly restricted by state planning and the spheres of commodities (such as labor force and land that are not considered as commodities).

The results of competition differ. In capitalist competition, some people will win and become rich while some others will fail, go bankrupt and even lose their lives, only to enhance the contradictions of capitalist society. In socialist competition, the winners will get more economic interest but none will become rich immediately. Some enterprises will consequently be eliminated in socialist competition, but the staff of such enterprises will be taken care of properly. Socialist competition will result in higher social productivity and in developing the socialist economy.

It is because of capitalist ownership that capitalist competition is anarchic. In our country, competition is related with state planning because of the socialist public ownership. Competition in our country is carried out under unified state planning to avoid anarchy in production and market and to overcome the negative role of the competition itself.

How To Protect Competition

Under the current management system, our enterprises still do not have enough necessary autonomy, therefore competition is still restricted in many aspects. For example, in some places, markets are blockaded and no products from other places are allowed to enter; the relations of supply and marketing are forcibly formed and prices are forcibly fixed. Therefore, various measures must be taken to open up the way for competition. The measures that merit consideration are as follows:

The autonomy of enterprises must still be expanded. Competition can be motivated only when enterprises have necessary autonomy and business achievements are linked with economic interest. At present, enterprises only have very limited management autonomy and this is not helpful in launching competition. There are only a few enterprises that are experimenting on profits retention while the autonomy of most enterprises is yet to be expanded. The enterprises that are conducting experiments also have very limited autonomy in many aspects. The State Council has decided that beginning next year, all state enterprises will have their autonomy expanded through profits retention. The enterprises that are conducting experiments must have their autonomy in more aspects such as independent accounting, paying tax to the state and responsibility for their own profits and losses. This is a natural trend in the development of profits retention. Thus with these measures, enterprises will be in a position to distribute their income and to be responsible for profits and losses after they have paid various taxes and debts, including loans and the interest on them. These conditions are in fact the premise for launching competition.

Link various channels of circulation of products so as to open up markets for competition. One region may sell the commodities from or set up sales organizations in other regions and this is applicable to rural areas and urban areas. Commercial and goods enterprises may selectively purchase goods from various wholesale points or from producing areas. Factories may be combined with shops to engage in both wholesale and retail business. Goods circulation must be improved and the number of links must be lessened in number. Those production units that can directly sell their products to buyers must be allowed to do so without having to go through the various links of commercial and goods departments. The amount of the goods that are distributed through planning must be gradually reduced so that more means of production will enter the market as commodities. In line with the principle of "selecting the best, competition and integration," enterprises must be allowed to break through the limit of regions and trades and sell their products and select and purchase raw materials and equipment in other regions. More production means service companies and goods and materials sales points must be set up. More markets for displaying and selling the means of livelihood and the means of production as well as trading points must be set up so as to gradually set up various trading centers as markets for competition.

Prices for some commodities may be floated. The current management over prices is too centralized with too much unified pricing and stringent control. Thus with stringent control and unified prices it is impossible for advanced enterprises to lower prices once they decide to do so. On the other hand, backward enterprises with high production costs may take advantage of this pricing method to wrest market and raw materials from advanced enterprises that will consequently not only be unable to fully display their initiative but will also even be forced to reduce their production. It is impossible to develop competition under such situations in which price changes are prohibited. The nature of competition shows itself in quality, varieties and services and ultimately in prices. Too stringent control over prices is not in the interest of developing competition. The prices of the products with high quality and those which are exceeding demand as well as the prices of inventory goods must be allowed to fluctuate down. The products that are marketed by enterprises themselves without unified pricing by the state must be allowed to be sold according to their quality as a method of floating prices in the interior of developing competition. In principle, it can be defined that prices are allowed to drop but not to increase and the principle of less profits with more sales must be followed. This method is beneficial to customers, enterprises and the state.

Oppose blockade and monopoly. No regions and departments are allowed to blockade markets and prevent commodities from circulating normally. Any move to prevent the purchase of goods from other places on the pretext of protecting local industries is in a fact more to protect what is backward. Competition must be allowed within various economic elements and among various other elements; no monopoly is allowed. At the same time, both collective undertakings and individual undertakings must be respected.

Experiences of capitalist enterprises in setting up profits centers within a company merit studying. Lenin said that capitalist monopoly gives rise to stagnancy and decadence. In order to avoid such defects, capitalist enterprises strive to maintain competition within a company. A company may set up various business divisions as relatively independent profits centers. Such method of competition is also maintained within a group of companies.

Promote the system of economic contract. All contracts must be stringent and they must be protected by laws. Those who breached contracts must bear economic responsibility. Some projects that can be contracted are allowed to be carried out through bidding.

Encourage the advanced and support the backward. The vital economic role must be fully displayed in competition. Raw materials, fuel and electricity must first of all be delivered to those enterprises that are producing quality products with less consumption and lower costs. Bank credits must also be offered to the enterprises that are doing well. With regard to backward enterprises, the departments concerned must help them solve their problems so that they can make progress. The enterprises that are to be eliminated must be merged with other enterprises or directed to produce other products. But this work must be carried out along with economic readjustment.

Step up the work about market information. All management departments at various levels and enterprises must often investigate market demand so that they will be able to estimate market situations and improve their planning to avoid indiscriminate production.

Strengthen economic laws and regulations. In order to guarantee that competition is carried out normally and for the purpose of handling economic disputes, it is necessary to strengthen the work of legislation and administration of justice. All enterprises must observe state laws and resort to legal method in competition. They must develop their own prestige and follow business morality. Any fraud and other activities that violate laws and harm the state's and people's interests must be punished economically and legally.

The Questions That Are Yet To Be Resolved

In order to guarantee that competition is carried out healthily, it is necessary to study and solve new problems.

The question of economic confidentially. In the past, enterprises were eating out of the same big rice bowl. As a result, they did not care about profits and losses and neither did they care about the publicizing of technologies. Now as enterprises are carrying out economic accounting, profits and losses are now very important. Therefore, they are reluctant to have their technology made available to the public, but by so doing they are labeled by people as carrying out "technical blockade." Economic methods must be used in solving the problems of technical exchanges that are carried out after competition. It is also necessary to study and formulate the laws and regulations about transfer of technology and patents so that transfer of technology is compensated. The reason for such compensation is that the technical developments are innovated after study that required money and labor. The results of study cannot be possessed by others without developer being compensated. One way is for the state to purchase a patent so that other enterprises can use it, another way is a patent may be purchased by awards from technical and scientific achievements. In short, laws and regulations must be formulated to promote technical inventions and popularize new technology.

The question of prices. The current pricing system is far from being rational in many aspects and restricts the launching of competition. It is, therefore, necessary to study how, according to the need of launching competition, to readjust the system gradually and in a planned way. Enterprises must be allowed to lower prices themselves, but such an act will cause the financial departments to worry that their income may drop. This problem can be solved by levying income tax instead of handing profits over to higher authorities. Some enterprises of the same trade with a weaker competitive position also oppose lowering prices. It still remains a question of how to help such enterprises improve their competitive position.

The questions of differences between economically backward regions and advanced regions. As the economic situations of these two types of regions differ so much from each other, the conditions for their competition also differ from each other. A country may implement a policy of teriff barrier to protect its industry against other countries. But it warrants consideration whether to implement a protectionist policy within a country. Some regions in our country now have taken measures to blockade their markets. Such measures not only restrict competition but are also not in the interest of developing national economy and their own economy. To blockade markets is in fact a measure to protect the weakpoints and disadvantages of the locality itself and not to protect its advantages. Quite a number of the economists in capitalist countries now no longer agree that instituting the protectionist policy of blockading market and increasing tariff is an effective measure. The formation of Common Market in Western Europe was a measure to break down blockades. To blockade the market as a way of solving the contradictions between the backward and the advanced regions is not a clever move. One way to solve the differences between these two types of regions is to study how to help the backward regions develop their advantages. Measures may also be taken to integrate the two types of the regions in various forms so that on the basis of mutual interest the backward regions will be able to develop their economy. Another way is for the state to render financial support to backward regions. In fact, the state has paid attention to this problem and it has consequently formed a fund to support such regions.

The question of our enterprises taking part in international competition. Following the development of competition, various provinces and some of major enterprises have already had their autonomy in foreign trade and their competition has been expanded to international market. For the interest of competition in international market, it is necessary to change the situations in which foreign trade is undertaken by a single department with too much centralization and too stringent control. We must persist in unity and integrity in foreign trade so that we will not be taken in by foreign businessmen so that our fraternal units will not suffer losses. But how to do this well is still to be studied.

(III)

The Relations Between Integration and Competition

The natural trend of restructuring our economic management system is integration and at the same time competition. The emergence of integration and competition is only natural because it is the need and result of managing the economy through economic methods. In order to manage the economy through economic methods we must carry out integration and launch competition. In restructuring our economic management system, we must separate enterprises from government so that they will have more autonomy and to a certain extent, an independent economic interest. With high centralization by the party Central Committee replaced by separate autonomy of the party Central Committee and localities, the localities will have more economic autonomy. With highly centralized state planning replaced by integration of planning adjustment with market adjustment there will appear a possibility for competition. Thus with more autonomy, enterprises and localities will have independent economic interests and consequently they will demand to be able to display their advantages and carry out integration of various forms. Further development in restructuring economic management system will naturally further develop integration and competition.

The integration and competition under socialism are complementary and they promote each other. A comparison between socialist integration and competition and capitalism serves to explain this question. First, capitalist competition gives rise to monopoly and anarchism while socialist competition promotes integration to prevent monopoly and anarchism. Second, capitalist monopoly restricts competition while socialist integration encourages competition. Third, capitalist competition and monopoly are related to private ownership and anarchic production but socialist competition and integration are related to public ownership and planned guidance. Fourth, capitalist competition and monopoly enhance contradictions of capitalist society while socialist competition and integration improve the relations of production and promote productivity.

But it must be pointed out that some experiences of capitalist countries in handling integration and competition merit our studying. For example, they encourage integration of medium and small enterprises, restrict the merging of some big enterprises and launch competition within a company.

When we are absorbing local experiences and those of other countries, in handling the questions of integration and competition, integrated organizations must in no way monopolize the relations with foreign countries. Therefore, there must be a number of integrated companies. With regard to internal relations, we must oppose the trend of centralized autonomy. Small enterprises must not be deprived of their autonomy neither should their autonomy be lessened just because of integration. On the contrary, integration must be carried out on the basis that enterprises must have their autonomy expanded. Integration is an objective need in the development of economy. Integration cannot be forcibly carried out when it is not demanded by enterprises.

An all-round implementation of the principles of "displaying advantages, protecting competition and promoting integration" is in the interest of readjusting the national economy, improving economic structure and further restructuring economic management system so that we will be able to use more economic methods in restructuring the present economic system. It is also in the interest of improving economic achievements, enhancing economic development, improving people's lives and meeting people's various demands. In short, further implementation of this principle will greatly boost our socialist economy to promote the realization of the four modernizations.

REFORM OF CIRCULATION SYSTEM DISCUSSED

HK261151 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 11, 15 Nov 80 pp 23-25, 32

[Economic commentary by Shang Ting [1424 1656] and Zhong He [6988 0735]: "Viewing the Importance of Circulation System Reform From the Development of Market Situation"]

[Text] Since the party's third plenary session, we have adopted a policy of national economic readjustment, reform, consolidation and development, have implemented the principle of regulation by planning together with regulation by the market, and under the guidance of state planning, have developed the strong points of each locality with competition being protected and business associations promoted. Consequently, the national economy has become more lively, and both city and county markets have been able to prosper, which manifests itself primarily in the following areas:

1. The supply situation of nonstaple foodstuffs has improved markedly. In 1979, the sale of major nonstaple foodstuffs was above that of the previous year with the sale of pork up 17 percent, eggs 54.5 percent, sugar 9.3 percent, liquor 15 percent, and different increases were registered for candies and fruits, pastry, cold drinks and snacks. The situation continues to improve this year. Owing to the abundant supply of pork, which increased 13.6 percent in the first 6 months of this year over the same period of last year, purchases are unrestricted and the price has been reduced three times. Since the introduction of an unrestricted supply of pork, the development of the catering industry, pastry industry and other light industries, such as leather products and soap, has increased.

2. The sale of manufactured products has increased sharply. In 1979, the sale of wearing-apparel increased 21.8 percent over the previous year. Daily necessities were up 19.1 percent, cultural and educational products 31.3 percent, chemical fiber cloth and polyester fiber cloth over 50 percent, wristwatches 40 percent, cotton jersey and pants, leather shoes, washing powder and sewing machines over 20 percent, bicycles and radios 18 percent, TV sets and tape recorders 2 to 3 times. In the first 6 months of this year, the sale of manufactured products continued to increase sharply with wearing-apparel up 28.3 percent over the same period of last year and commodities 26 percent. The whole line of textile products together with

handicraft products have increased in quantity as well as improved in quality. Moreover, there are new products with new colors. In the process of test-marketing and boosting sales volume, various kinds of stylish, highly marketable new products are constantly being put on the market, which have proved to be very popular with the masses. Both high-quality and medium-quality cosmetics, gifts and decorative products have become highly marketable products.

3. Great development was seen in the catering and service industries. In 1979, there were 72,000 food establishments in the state catering network, and total business done was 5.61 billion yuan, which was up 16 percent over the previous year. The number of newly established collective and individual food establishments is close to the number of state-owned ones. The long-existing difficult situation of finding hotel rooms, restaurants and tailor shops has gradually been changed. The good old traditions such as famous dishes, delicate food and various provincial foods are now making a comeback. The development of catering and service industries are playing a more important role in enriching as well as in enlivening the market.

4. The market has become more lively as result of conducting businesses flexibly using various forms. Many state commercial, catering and service establishments in various areas are working on correcting past inflexible ways of conducting businesses and overcoming bureaucratism through such new practices as mobile shops, door-to-door service, advance booking of restaurant tables, extending business hours, morning and evening markets and others. Collective and individual commercial, catering and service establishments are able to make full use of the advantage of being flexible. They can open early and close late, set up stalls, and peddle in the streets. The hawkers' cry in the streets, which has not been heard for many years, can be heard more and more, and services, such as repairing furniture, fluffing cotton, sharpening knives and scissors, and others are also gradually making a comeback. The agricultural trade markets in large cities and medium-size cities are making up for the shortage of agricultural nonstaple products in the state commercial establishments, and trading is active and business prosperous. In short, business is conducted using various forms in a flexible manner. Markets are no longer inactive, and the people's livelihood is improved.

The market is a total reflection of a country's national economy. The prosperity seen in the present market fully reflects the good economic effects achieved in the readjustment of our national economy and the great success attained in the initial reform of our economic management system and commodity circulation system. The development of a commodity economy demands a broad market, and the commodity circulation system must be able to satisfy this demand. We think the commodity circulation system must be further reformed on the basis of its early success.

Develop a Multisector Economy

Generally speaking, the transformation of private ownership carried out in the fifties was successful. Later, problems developed as a result of work being done precipitiously. Under the guiding thought of the higher the form of ownership, the more advanced it is, we resorted to the measure of "sweeping everything aside" and stressed "poverty is the characteristic of the socialist transitional stage." The situation of commodity circulation was such that we placed restrictions on the cooperatives, and policies relating to them were only transitional. Individual businesses, catering and service industries together with country fairs were deemed as the tail of capitalism, and the tail had to be cut off. Moreover, our interpretation of the socialist state market being a market solely for state-owned businesses was one-sided. Consequently, the number of distribution channels was reduced and business was conducted using only one form. The number of business establishments was reduced from 1 million in 1957 to 219,000 in 1979, a reduction of 80 percent or so, which is bad for production and the people's livelihood.

At present, the problem has caused concern in various parts of the country which have begun the development of a multisector economy and the readjustment of the commercial structure. In 1979, the number of various types of collective businesses at levels higher than county cities and towns increased to 128,000, an 83-percent increase over the 1978 figure. Businesses such as those run by husband and wife, father and son, brother and sister and hawkers, are developing at a very fast pace. For instance, in the city of Shangyang, there were only 59 individual businesses in 1978, but they increased to 4,700 in 1979. Urban agricultural markets have been set up one after another in 208 cities throughout the country, and they increased to more than 2,200 in 1979. The development of collective and individual businesses and urban agricultural markets is playing a positive role in enlivening the market and improving people's livelihood. However, some of our comrades, being accustomed to monopolistic practices, are very worried that the development of and the competition from collective and individual businesses might reduce state business volume, thereby causing chaos in the market. Actually, their worry is unnecessary. As practice proves, under the conditions of public ownership being dominate in our socialist system, allowing a multisector economy and various forms of conducting business to exist is favorable to the development of our economy. If we can only strengthen the leadership and manage our work well, the market will not become chaotic. On the contrary, we will be able to boost the development of commodity production, improve the people's livelihood, enliven the market, impel state businesses to improve business management through competition, and increase economic results.

Adopt Various Forms in Purchasing and Marketing

For many years, we had a system of state monopoly for purchasing and marketing of industrial products. It played an important role in the transformation of private ownership. Originally, after the transformation of private ownership was basically completed, it should have been adjusted according to the changing conditions. However, at a time when imbalance appeared in the national economy, the development of commodity production was slowed down and market supply was insufficient over an extended period of time and the scope of state monopolized marketing was widening day by day. The categories of products under state enterprises' planning and management at the state level, increased from 98 in 1957 to 131. Moreover, they also increased at various levels of planning. Consequently, the direct relationship between producers and consumers was severely affected.

As a matter of fact, both commerce and industry suffered as a result of state monopolized marketing. Therefore, it was necessary to carry out a reform. State monopolized marketing of manufactured products was initially reformed last year, when the Ministry of Commerce reduced the number of commodities under its planning and management, thereby increasing the number of suppliers, and the development of direct links between production and marketing, that is, industrial self-marketing. The Ministry of Commerce has recently decided to greatly reduce the number of planned commodities starting next year and at the same time abolish state monopolized marketing of manufactured products. The planned commodities and the unplanned commodities will be treated separately according to four forms of purchasing and marketing, which are: state purchasing and marketing and state purchasing and distribution, planned purchasing, purchasing based on orders and selected purchasing.

Once the number of planned commodities has been reduced, we should tighten our grip on planning and management while maintaining the seriousness of state planning. Under the guidance of state planning, the formation of a commodity circulation system should be based on a system of commodities of the same line. No business establishment should attempt to disrupt or undermine the implementation of state planning. Manufactured products of the same kind should be priced uniformly in a single city, and the industrial planned products can neither be purchased nor marketed through negotiated deals so that the principal role of planned commodities in stabilizing the market and prices can be secured. When state monopolized marketing is abolished, we should, at the same time, institute a contract system and perfect it, and strictly abide by the contract.

Reduce the Links in Commodity Circulation

A commodity has to go through a circulatory process of continuous exchange from production to final consumption. In this process, the number of links in the commodity circulation and whether or not they are economical, can directly affect production and consumption. In the past, when supply was insufficient, the setting up of wholesale shops was carried out according to administrative divisions. As a result, the links increased, more capital was held up, trade barriers were set up with each locality hiding itself as in a fortress, and the flow of commodities was not smooth. Thus, the naturally formed economic relationships were destroyed.

The key to invigorating the circulation of commodities lies in upholding the principle of organizing circulation of commodities according to economic divisions, making adjustments in wholesale shops, reducing the links, clearing up the circulatory channels, and restoring the economic relationships between various districts and between various enterprises. At present, the following reforms have to be carried out first: 1) The present number of 11,849 county and municipal wholesale shops cannot meet the demands of the changes in commercial structure and the circulation of commodities. Wholesale shops engaging in both wholesale and retail businesses should be increased in order to meet new conditions. Both wholesale and retail shops should be allowed to make purchases from other places, establish direct link with factories and make purchases of industrial self-marketed products or make purchases of planned products through the fixing of production quotas by the wholesale shops themselves. By so doing, trade barriers in various districts can be broken down, the circulatory links reduced, operation expenses cut down, and economic effects increased, to name but a few advantages. 2) The present number of provincial purchasing and supply agencies is 1,063. After planned products have been greatly cut down and the restrictions on wholesale and retail shops making purchases from other places lifted, some of those agencies, which were not set up in accordance with the principle of circulating commodities according to economic divisions, will be gradually shut down while others will be amalgamated. We will carry out "amalgamation between purchasing agencies and wholesale shops, specialization of a higher degree, profit calculation in percentages, and guarantee of allocation and transfer of goods." 3) Various forms of conducting business will be developed. In both large and medium-size cities, we will set up small wholesale commodity markets or small commodity exchanges, hold trade fairs and exhibitions, set up business trust companies and perfect them, and widely develop such businesses as purchasing through agents, selling on a commission basis, mail-order, storage service, shipping service and distribution. In order to develop the role of an economic center, "trade centers" for facilitating the flow of commodities and promoting free purchasing of goods should gradually be built in such cities as Shanghai, Tianjin, Shanyang, Chongqing, Wuhan, Guangzhou and Si'an. Another consideration is that when approved, a retail shop selling durable consumer goods should be given some flexibility in the way it receives payments and delivers goods. Some should be allowed to deliver goods in advance and receive payments later by installment, while others receive payments in advance and deliver goods later at a fixed date. Areas related to the above-mentioned reforms include setting up a national business information system, making better market forecasts, increasing business information exchange, and developing the regulatory role of the market.

Expanding the Rights of Enterprise Self-Management

Enterprises are the base of our economic structure. They should be managed using economic methods. In the past, they were managed through high-level orders and by the party secretary. No attention was paid to economic accounting and economic effects and working incentives, initiative and creativity had not been fully developed. Moreover, business was not conducted in accordance with objective economic laws. All of this must be changed, and enterprises must be given certain rights of self-management.

In expanding the rights of enterprise self-management, we believe that the main areas should be: financial rights, planning rights, pricing rights and personnel management rights. In expanding financial rights, we should, on the basis of retaining profits, continue the practice of paying tax on profits instead of turning them over to the state, and increase enterprises' production development funds and workers' welfare funds. Therefore, enterprises will be in a position to make face-lifting changes on the strength of their own accumulation. In expanding planning rights, we should enable enterprises to make independent decisions about development and business plans in the light of their own existing conditions and business scope. Moreover, the practice of high-level authorities giving work, which has no bearing on the practical situation, is to be done away with. In expanding pricing rights with the implementation of state pricing policy as a prerequisite, conditions must be set before enterprises are gradually given certain rights to set and adjust prices, thus enabling them to use properly the law of value. Moreover, the regulatory role of the market will be developed and businesses enlivened. Expanding personnel management rights enables enterprises, based on state-approved quotas for workers, to select or to discharge workers when necessary, thus reversing the situation of rigid assignment of work. In short, enterprises should be made relatively independent economic units and business conducted in accordance with objective economic laws. Furthermore, concepts relating to business operations, the market, service and competition should be strengthened, enterprises and workers' initiative enhanced, and standards of enterprise management constantly raised.

As for enterprise management, a complete set of rules and regulations should be set up. Based on investigation and research, the Ministry of Commerce has drafted "Rules on State Commercial Retail Enterprise Management--daily necessities and manufactured goods" and "Rules on State Commercial Wholesale Enterprise Management at the third level," in which we find rules governing the expansion of rights of enterprise self-management and the institution of a democratic management system. Therefore, the experiment of expanding rights of self-management and the experiment of implementing the rules governing management should be jointly carried out.

At the third meeting of the Fifth National People's Congress, Comrade Hua Guofeng, when speaking of carrying on the reform of the economic management system, pointed out: "The general orientation of the reform of our economic management system is to reverse the overly centralized (at both the central and the local levels) management system, expand the rights of enterprise self-management and those of workers' participation in management, replace regulation by planning with both regulation by planning and regulation by the market, and replace administrative organs managing the economy with administrative methods by economic organizations managing the economy with economic methods and business laws. The circulation system reform must adhere to this general orientation and be resolutely carried out. We should be bold enough to make innovations while acting with caution. On the basis of the initial reform, we should have a comprehensive plan and carry out further reforms. Furthermore, we should set up a commodity circulation system which includes such features as multisector economy, various forms of conducting business, various forms of associations, increased number of circulation channels but fewer links. We are sure that by following the economic system which includes further reform of the circulation system, both industrial and agricultural production will develop rapidly, the living standard will be further raised and the market will become more prosperous.

'GONGREN RIBAO' COMMENTATOR REPORTS ON TAX EVASION

HK221259 Beijing GONGREN RIBAO in Chinese 2 Dec 80 p 1

[Commentator's article: "Strengthen the Concept of Taking the Whole Situation Into Account and Safeguard Financial and Economic Discipline"]

[Text] Some leaders of the Sichuan No 1 Cotton Textile Dyeing Plant transferred to their plant the taxes that should have been submitted to the state by overstating the plant's production costs and by reducing actual profit figures. This is an illegal act which transfers the property of a large collective to a small one. It impairs national interests and should be strictly prohibited, whatever the motive is.

At present, there are some enterprises in various localities selected to take part in the experiment of "practicing independent accounting, paying taxes to the state and assuming sole responsibility for their profits or losses." This is an important aspect of China's economic reform, and it constitutes a major reform in the financial management system of enterprises. The selected units now pay taxes on profits instead of handing their profits over to the state. In essence, this changes the relations between the state and the enterprises in the distribution of income. It expands more fully the financial power of enterprises, further demonstrates the principle of material incentives, takes into account the benefits of the state, enterprises and individuals and implements the principle of distribution according to work. In this way, it mobilizes the initiative of workers and enterprises and creates a favorable condition for enlivening the economy and promoting the development of productivity. For instance, in the five Sichuan enterprises which are trying out this new method, the total output value in the first 7 months of this year registered an increase of 48.8 percent over the corresponding period last year; profits went up by 82.7 percent; the revenues they turned over to the higher authorities increased by 48.3 percent; the profit retained by the enterprises was more than doubled. Facts have adequately proven the advantages of this reform.

However, everything tends to divide into two. As their financial power is expanded, the enterprises selected to carry out this reform must guard against the influence of bourgeois management ideology so that they will be able to handle properly the relationship among the state, enterprises and workers, instead of practicing fraud, transferring the property of the large collective to a small one and impairing national interests. For example, some people hold the view that: "Although they breached the financial and economic discipline, they did not put the money into their own pockets." This is an excuse for breach of financial and economic discipline. Others hold that: "The state is so big and rich. What are such small amounts of taxes to it?" They always place national interests in the secondary position and try all possible means to keep more for themselves. Do they not know that "tiny streams can converge into large rivers?" If everyone "puts his personal interests above everything else," delays tax payments or evades taxes, where can the state obtain its funds for construction? Will the four modernizations, which the people have been longing for, not end in failure? Leaders of enterprises must take into account to a greater extent the interests of the state and the people, particularly when the state is still in temporary financial difficulty. Acts that embezzle public revenue will adversely affect socialist economic construction and should be firmly opposed. We must understand that the state has given due consideration to the interests of the enterprises which are selected to try out the economic reform. To earn more profits, the enterprises should try to improve their management, reduce their production costs, tap their own potential, increase production and practice economy rather than attempt to encroach on the interests of the state and the people.

The state's tax policy was formulated in accordance with the party's economic policy. It is one of the important levers to develop the socialist economy and is an important part of the socialist legal system. Like other decrees and stipulations, our tax policy has clearcut legal effects. All localities and units should implement this policy strictly and should not follow their own ways. They should not allow a statement made by a particular person to arbitrarily change the state regulations nor should they "take whatever they need" and "do whatever is profitable" to them. They must realize that paying taxes according to law is a serious and obligatory duty of the enterprises. Tax departments at various levels and the broad masses of workers should strengthen their supervision of the finances of the enterprises and safeguard the law and discipline on taxation. Our workers are the masters of the enterprises and the state. They must strengthen the concept of taking the whole situation into account and properly handle the relationship among the state, enterprises and individuals. They must voluntarily take accumulating funds for the state as their glorious task. Moreover, they should supervise leaders of enterprises to correctly implement the tax policy of the state and to punctually pay the taxes in full so as to insure the supply of funds for the four modernizations. They must keep the public interest in mind, boldly reveal and struggle against the illegal acts of the small numbers of leaders who disregard state interests and deliberately evade or refuse to pay taxes, and enthusiastically safeguard national interests.

PROS, CONS OF LOTTERY SAVINGS SYSTEM DISCUSSED

Cons Outnumber Pros

Beijing ZHONGGUO JINRONG [CHINA'S FINANCE] in Chinese No 8, Aug 80 p 38

[Forum article by Mo Wenqi [8010 2429 0796]: "Lottery Savings System Has More Cons Than Pros"]

[Text] Recently, people and bank workers in some areas have discussed the question of introducing the lottery saving system. I would like to offer my views.

Lottery savings means the payment of interests by the bank on savings deposits in the form of prizes to the winners only but not to all depositors. In the 1950's, Beijing Municipality on different occasions used this system in six different forms, including "fixed lottery savings with guaranteed capital and value for one-time deposit and one-time withdrawal"; "fixed lottery savings with one-time deposit and one-time withdrawal"; "fixed lottery savings"; "lottery savings with current deposits and one-time withdrawal"; and "current lottery savings." I am a veteran on the savings front and still have vivid memories of these experiences. At that time, when the drawing of prizes took place every month, we had to invite representatives of various circles and the broad masses to the great hall of a theater to supervise the drawing. There was also entertainment, such as opera, movie or other cultural performances, after the drawing. The winning numbers were promptly publicized through newspapers, radio, leaflets and other media throughout the city. This type of savings involved a lot of fanfare, but why was it discontinued? To my knowledge based on practical experiences, there are pros and cons for this type of savings, but the pros are less than the cons.

There are two pros:

First, it simplified savings procedures. No interest is calculated at the time of withdrawal and this helps raise work efficiency and save the depositor's waiting time. Second, convenience to the depositor. After making a deposit, he can withdraw it at the time of maturity at any savings department in town (except for the current lottery savings).

There are generally five cons:

First, the chance to win is very slim, and people tend to rely on luck. In this type of savings, the value of the prizes serves as an attraction for depositors.

The higher the value, the greater the attraction will be, and the less the chance of winning. For example, in the "fixed lottery savings with one-time deposit and one-time withdrawal" once used in our municipality, 100,000 accounts were organized for one drawing, offering one first prize of 500 yuan, four second prizes of 50 yuan each; 20 third prizes of 25 yuan each, 200 fourth prizes of 5 yuan and 2,000 consolation prizes of 1 yuan each. The total prize fund paid by the bank is generally the same as the total amount of accrued interest. Through this arrangement by the state banks, the accrued interests of 100,000 savings accounts were used to pay a very small number of people. Some people making their deposits said: "Let us join it and try our luck. Just imagine what will happen if I win the first prize by a one-in-10,000 chance." In fact, the chance was less than one in 10,000; it was one in 100,000. This system naturally encourages people to try their luck and cultivates egoism.

Secondly, since the participants are motivated by curiosity and the desire to win, they give little or no consideration to supporting national construction, fostering the habit of diligence and frugality, planning their livelihood and setting aside something for the future. Therefore, they will become dejected after several unsuccessful ventures. Although banks have tried the lottery savings system for more than 10 years, the ratio of deposits from this source to the total savings deposits has never been high. Let us take for example the lottery current savings of the Beijing Municipal Bank. In 1956, these deposits amounted to 12.5 percent of the total savings deposits; in 1957, 13.1 percent; in 1958, 8.7 percent; and in 1959, 12.3 percent. In the 3 years prior to the introduction of the lottery current savings system (1953-1955), the average amount of interest-bearing current savings amounted to 22.2 percent of the total savings deposits. After the introduction of the lottery current savings system, it dropped to an average of 12.5 percent. From this, we can see that the increased portion of lottery current savings is about the same as the decreased portion of interest-bearing current savings, the only difference being in the types of savings. Experience has proved that this method cannot be conducive to increased savings.

Thirdly, some people participating in the lottery fixed savings are so disappointed by their failure at the first drawing that they cannot afford to wait until the maturity date and transfer their savings to others at a discount. In this case, savings would become meaningless.

Fourthly, all types of lottery fixed savings do not take into account the depositors' identities and no measures are provided as a precaution against the loss of the savings certificates. If these certificates are lost or stolen, there is no way of tracing them, and the banks cannot protect the interests of the depositors.

Fifthly, at the time of the prize-drawing, a theater has to be rented and actors hired in addition to people being invited to act as supervisors. All this means a lot of work and expense for the bank.

Based on my experience in this type of savings over many years, I am of the opinion that the system of lottery savings should not be restored since its cons are more than its pros.

Arguments For Restoring System

Beijing ZHONGGUO JINRONG [CHINA'S FINANCE] in Chinese No 8, Aug 80 p 39

[Article by Lu Tian [7627 3944]: "Lottery Savings System Can Be Tried"]

[Text] In recent years, some people hope to see the return of the lottery savings system and some local banks are now studying this matter. There are divergent views as to the pros and cons of this system. I am in favor of it for the following reasons.

1. The lottery savings system can effectively arouse people's enthusiasm in saving and encourage the practice of economy in order to accumulate more construction funds for the "four modernizations." As we all know, savings with current deposits and one-time withdrawal has strong public support and is much welcomed by the masses. Although the present wage level in our country is low, it is still possible for workers in general to save 10 or 8 yuan every month. If a worker deposits 5 yuan every month, he will accumulate 60 yuan a year. For common workers, a monthly saving of 5 yuan does not lower his standard of living, but an annual accumulation of 60 yuan can help him a lot. This is the advantage of saving with current deposits and one-time withdrawal. The annual accumulation of 60 yuan carries with it an accrued interest of 1.44 yuan. An income of slightly over 1 yuan cannot do much to improve the worker's living conditions. Therefore, the main attraction of savings with current deposits and one-time withdrawal does not come from the interest earned, but rather from its contribution to the four modernizations. The so-called lottery savings system with current deposits and one-time withdrawal means that all or a portion of the interests, which should go to all depositors, are pooled and used as prizes to be distributed to a small number of winners. Supposing a monthly deposit of 5 yuan is made for 1 year and there are 100,000 accounts, the total accrued interests will come to 144,000 yuan. If there are 40 first prizes of 500 yuan each, 120 second prizes of 200 yuan each, and 10,000 third prizes of 10 yuan each, the winner of a first prize can buy a TV set; the winner of a second prize can buy a fairly good watch or a fairly good bicycle; and even the winner of a third prize can buy a new suit. According to the above calculation, 10.16 percent of the depositors, or one among every 10 of them, can win. Those who do not win can still accumulate their savings, but the winners, besides accumulating their savings, can still get prizes which are worth many times their interests and with which they can buy more equipment and improve their living conditions. Therefore, the lottery saving system is more attractive than an ordinary savings system. Some comrades worry that the lottery savings system can have only a temporary but not a long-term attraction. I don't think so. It is possible that some depositors failing to win at several successive drawings may discontinue his saving deposit. However, failure to win at one drawing does not mean that he can never win. Therefore, for the vast majority of people, its attraction should last a long time.

2. Instead of producing any passive effects, the lottery savings system raises people's hopes and arouses their interests. Without these effects, the system will be unnecessary. While raising hopes and arousing interests in some ways, will it produce passive effects in other ways under conditions of socialism?

Generally, the answer is no. We should have faith in the gradual rise of people's socialist consciousness. While their participation in the lottery savings system is associated with the hope to win prizes, they also have the intention of supporting the four modernizations. It would be difficult to imagine that their participation in this system will breed bourgeois ideas. Winners of first prizes can get only 500 yuan each which cannot materially alter their economic standing.

3. The lottery savings system does not by any means deviate from the principle of saving. If a portion of the interests is changed into prizes, does it violate the principle of paying interests on savings deposits? I don't think so. On the whole, the amount paid by the bank as interest is the same as the amount of prizes, although for the individual depositors, the situation is different. It is true that the winners get far more than their normal interest, while those who do not win cannot get their normal interest. But the depositors have been mentally prepared for this eventuality. Some comrades also worry that the system of lottery savings will cause "mass transfers of accounts." This worry is unnecessary. As far as the state is concerned, all savings systems are the same. If the lottery system of savings is introduced, the ordinary system should still be maintained. Probably the number of accounts under the ordinary system will be reduced after the introduction of the lottery system, but, as far as the bank is concerned, this is only a change in the forms of saving and the aggregate amount of deposits is likely to increase. This will be a greater contribution to the state's construction funds. Based on the abovementioned factors, I favor the restoration of the lottery savings system.

FINANCE AND BANKING

EXPERIMENTS ON RESTRUCTURING BANKING SYSTEM SHOW GOOD RESULTS

Beijing ZHONGGUO JINRONG [CHINA'S FINANCE] in Chinese No 8, Aug 80 pp 5-7

[Article by Sichuan Provincial Branch of People's China Bank: "Several Points Concerning the Restructuring of the Banking System"]

[Text] To meet the requirements of national economic readjustment and the four modernizations, and in accordance with the resolutions adopted by the Sichuan Provincial Party Committee, experiments of expanded decision-making power have been carried out in 10 industrial and 40 commercial enterprises since 1979. Last January, thanks to the leadership and concern of the main office of the People's Bank of China, we also carried out experiments on restructuring the banking system. The Provincial Branch has submitted to the Provincial People's Government a "Report on Views Concerning the Experiment in Restructuring the Banking System," convened a provincial conference on banking, carefully studied the steps and methods for restructuring and set up various indices and tasks to be fulfilled. From the thoroughness and promptness of the various local banks in carrying out their work, we can see that the experiments in the past 6 months have begun to show good results.

Major Aspects of Restructuring

According to the plan approved by the Provincial Party Committee, the Provincial Government and the main office of the People's Bank of China, there are 10 major aspects in the restructuring of the banking system in our province.

(1) "Unified planning, differential administration, coordinated deposits and loans and controlled balances" in credit planning and control.

(2) Medium- and short-term loans to industrial and commercial enterprises for acquiring equipment.

(3) Continued implementation of the principle of "discriminating treatment with preference to the most deserving ones" in the control of loans for circulating capital, and the use of the levers of credit and interests in encouraging the enterprises to tap potentials and in accelerating the turnover of funds.

(4) Improvement of the methods of commercial loans by selecting several units among the third-level wholesale and retail enterprises in Chengdu and Chongqing for experiments in the control of deposits and loans under separate accounts.

(5) Improvement of the method of closing accounts through the system of "collection agents in different places" throughout the province.

(6) Improvement of cash control by appropriately increasing the unit's imprest funds, and permitting cash payments for the procurement of agricultural and sideline products in country fairs by enterprises and units according to established regulations.

(7) Strengthening economic accounting in banking by setting up five economic criteria for assessments.

(8) The system of retaining a portion of profits and the system of contracted responsibility for expenditure.

(9) The system of rewards for bank workers and staff members and rewards according to work points.

(10) Restructuring the cadre control system in banks.

Among these 10 aspects, the system of planning control, the extention of medium- and short-term loans for equipment, and economic accounting in banking are the key items. Fairly good results have been obtained after half a year's experiments as shown by the increase of deposits, the quicker turnover of credit funds, reduction of errors, increase of profits, lowering of expenditure and other improved banking functions.

Several Points Noted

For more than half a year, we have noted the following points in restructuring the banking system:

1. Repeated Stress on the Aim of Restructuring and Constant Efforts to Raise Ideological Awareness

Last March, when we held a provincial conference on the work of the People's Bank of China to discuss the problems of restructuring, we only thought of the concrete plans for improving the work and failed to anticipate the ideological problems involved. Soon after the conference began, disputes arose over the problem of indices, particularly the index of profits to be retained by the bank. In view of this, we organized the participants to discuss the aim of restructuring so that they could understand that the restructuring of the banking system is only a means, while its aim is to enliven the work of banking, to attain better economic results by spending less money, and to promote the development of the national economy more effectively. After discussion, the conference set up six criteria for evaluating the result of restructuring. They were: First, whether the accumulated funds total more than before; second, whether the use of funds is more flexible; third, whether the extention of loans can produce better economic results; fourth, whether experiences of success have been gained; fifth, whether control by the bank has been improved; and sixth, whether talents have been cultivated. On the basis of raising ideological awareness, the attention of the conference was directed to the use of banking as a lever in gaining even better economic results. When the participants had a better orientation of their work, we went to inspect the lower levels. In several symposiums attended by the branch managers, we discovered that in organizing funds, they all liked to see a continual increase of deposits or even a monthly rise in the enterprises' deposit level regardless of the existing circumstances. In some cases, medium- or short-term equipment loans were completed in one payment instead of being paid by installments as required by the enterprises. These problems showed that in strengthening economic accounting and fulfilling the profit quota, whatever is gained will have a close bearing on the welfare projects of the basic level bank units and the personal benefits of the comrades whose bonus is calculated according to work points. We firmly carried out ideological work and education on the aim of restructuring so that the broad masses of workers and staff members could correctly understand the relationship between economic accounting and the implementation of policies, and properly handle the relationship between the bank and the enterprises, thus enabling the experiments to develop in the right direction.

2. Increased Authority for Bank Managers and a Greater Role for the Banks as a Whole

Under the system of overall control by the central authorities in the past, banks at different levels were controlled by direct chains of command leaving the bank managers little power or responsibility. Whenever questions of quota or rules and regulations arose, the sections or sub-sections concerned usually requested instructions from corresponding sections or sub-sections at a higher level, and it was difficult for the bank manager to handle any contradiction between different sections. The result was that only "individual spare parts" were used while the whole set of machinery was left idle, and it was very difficult to give play to the role of the bank as a whole unit. Now that restructuring is being carried out, the development of vocational work is linked with the interests of the units and the individual workers and staff members, while authority, responsibility and benefits are closely interrelated. It is therefore necessary that in external relations, problems should be considered from the standpoint of the bank as a whole, while, in internal relations, there should be closer cooperation among various sections. Thus in addition to using the "spare parts" well, the role of banks at various levels as "whole machines" should also be developed. Since the bank managers have now greater power and heavier responsibility, they are duty-bound to support the state's economic development as well as to take care of the personal interests of all workers and staff members in the bank. They said: "Although the responsibility is heavy, the work is easier. What we say now counts and we can give directions freely." From the bank managers we met, we could see they played their roles as they never did before.

3. A Better System of Reporting With a View to Enlisting Support From Party and Government Leadership as Well as Other Departments

After attending the provincial conference on banking, the banks at various levels first made detailed reports to the local party and government authorities and obtained their guidance and support for restructuring the banking system. Many prefectural and county leaders sent representatives to the bank conference, and some of these leaders attended the conference and made speeches in support of the experiments. The prefectural leaders even presided over the meetings dealing with the extention of medium- or short-term equipment loans so that they could even up the loans for tapping potentials, and the renovation and transformation of equipment. The Mayor of Chongqing even brought the bank's cadres to the enterprises to carry out in-depth investigations on the way loans were used, and discovered that a thermos jar plant failed to complete a production line. He then studied the situation with the departments concerned and set a time limit for the production line to be completed. When the Sichuan People's Government had distributed the report containing the suggestions of the provincial branch banks concerning the experiments, the banks at various levels held internal meetings to discuss and implement these suggestions. Many of them even held meetings with the leaders of enterprises and the financial personnel, particularly pointing out the need to publicize the main aim, the ideas and contents of the restructuring and the impetus it would produce on the enterprises. Their action won the support of the enterprises and units.

4. Reforms in All Types of Work to Improve the Economic Results of Restructuring

Since adopting the method of "unified planning, differentiated administration, coordinated deposits and loans and controlled balances" in the system of credit planning and control, banks at various localities have completely changed the practice of being concerned with only individual savings deposits but not the collective deposits of enterprises and units. Under the unified leadership of the bank manager, all sections and sub-sections have pooled their resources in an overall disposition of funds. The credit department is now responsible for enterprise deposits and constantly keeping tracks of any change among the big depositors. The credit personnel visit the factories for not only arranging loans but also organizing deposits. They also study the changes in various types of deposits and supply periodical statistical tables. The savings departments attend to savings deposits as well as miscellaneous social deposits in small amounts, while the accounting departments are responsible for opening accounts for deposits and watching for any sign of change in the pattern of deposits and withdrawals. Some of these departments even set up a "warning line" system for deposits, and, in case of any significant change, will issue the warning signal to all sections concerned so that the cause can be determined and appropriate measures taken. In the first half of 1980, the total balance of various deposits increased by 260 million yuan over the amount at the beginning of the year. Compared with the same period of 1979, however, it was a drop of 280 million yuan. The difference of 540 million yuan between the rise and the fall changed the pattern in our province for many years according to which the total balance of deposits should decline in the first half of the year.

In extending medium- and short-term equipment loans, the branches of the People's Bank of China throughout the province in 1980 allocated 350 million for 982 projects, of which 72 percent belonged to the light and textile industries or related to other products in short supply. These projects took up 64 percent of the loans. Completed and commissioned, they will raise the output value by more than 1 billion yuan, increase profits by more than 200,000 yuan, and increase national revenue by more than 100 million yuan. They will also increase foreign exchange earnings by several tens of millions of dollars. In order that the medium- and short-term equipment loans can produce full economic benefits, the provincial and the various local banks paid attention to the following four conditions in the extention of loans: (1) Firm adherence to the principle that these funds are mainly used for the old plants to tap their potentials and to renovate and transform their equipment instead of supplementing the funds for capital construction or extending the capital construction front; (2) Firm adherence to the principle of priority to those projects that require small outlays but yields quick and good returns, or bring large foreign exchange earnings, instead of extending loans indiscriminately; (3) The need for on-schedule redemption within 1 to 2 years, but not more than 3 years; and (4) Exercising the decision-making power of the banks in granting loans. Although other departments can request loans or suggest that loans be granted by the banks, the banks have the right to decide on granting or refusing to grant any loan, and to decide on the size and the duration of the loans. These conditions were supported by the leaders of the provincial party committee and the provincial government.

When the banks have strengthened economic accounting and internal control, it will be necessary to conduct periodical examinations of the five economic criteria, to control the disposition of funds, and to analyze the economic effects. Thus the bank managers must personally attend to their vocational jobs, and the workers and staff members must acquire higher vocational skill. At present, many bank managers are taking the lead in undergoing vocation training and no longer consider it an honor to be "laymen." Recently, we held a symposium of bank managers in nine counties and municipalities. Every one of them brought with him tables and charts and their reports on the situation were backed up by statistics. In studying problems, they now talked authoritatively. The manager of Jianyang County Branch said: "I have been a bank manager for 24 years, but I began to read reports every 10 days and every month in studying the money market and in analyzing the changes in the situation of funds only this year. I was 'forced' to do this by the restructuring." To better organize the disposition of funds, many county and municipal branches have formed special groups for this purpose and some of them even set up economic accounting groups with the bank manager in command, to be assisted by the chiefs of the planning, credit, savings and accounting sections. There are also special controllers and auditors conducting analyses and investigations every 10 days or every month, studying the sources of funds and the way they are used, paying prompt attention to current problems, and making use of funds at their discretion. They also examine the way in which the five criteria are fulfilled besides coordinating the work of various sections in carrying out their duties. All banks are now careful in calculation, strict in budgeting and meticulous in the practice of economy. Because of their attention to economic accounting and the strengthened internal control, the five economic criteria have been fairly successfully completed by the banks in various parts of the province. According to statistics by 12 banks in eight municipalities including Chongqing, Chengdu, Yibin and Leshan, the turnover rate of funds in the first half of 1980 was 2.67 times, being 0.12 times faster than that of the same period in 1979. The rate of accounting error was reduced by 40 percent; the rate of errors in payments was lowered by 51 percent; and the profits realized amounted to 103 million yuan, an increase of 17 percent as compared with the same period of 1979. The level of bank management has also been raised.

PROTECTION OF COAL RESOURCES CONSIDERED NECESSARY

OW191347 Beijing XINHUA Domestic Service in Chinese 0703 GMT 19 Dec 80

[XINHUA reporter Cao Welong's letter: "It is Imperative To Draw up a Law To Protect Coal Resources"]

[Excerpts] Taiyuan, 19 Dec--This reporter recently visited coal departments in Shanxi Province and heard many engineers and technical personnel calling on concerned departments of the state to promptly draw up a law to protect coal resources and prohibit damage to coal resources and waste in production.

Shanxi is our country's important coal energy base. It has abundant coal deposits of all kinds scattered in various localities of the province. In 1979, total output of coal in Shanxi Province exceeded 100 million dun, accounting for one-sixth of the national output. Coal production continued to rise during the period from January to November this year with total output reaching 109 million dun.

However, in order to develop industry, a number of communes and production brigades in the province blindly opened up small coal pits on a large-scale without approval by departments concerned, in disregard for state policy on the development of coal resources. According to statistics released by the provincial people's government following a recent investigation, the total number of small coal pits run by commune and production brigades in this province now totals 3,256, representing an increase of more than 1,300 as compared with the number 2 years ago. Of those coal pits, more than 830 were opened without permission.

Many small coal pits are located within the boundary of state coal mines in a cluster and some are located near big mines. They contend each other for coal deposits and they have created many contradictions.

Shi Hongcai, coal mining engineer of the Shanxi Provincial Coal Industry Administration, pointed out: At present, the people's governments at various levels in the province are making efforts to consolidate small coal pits. They have issued orders repeatedly forbidding the opening of additional coal pits. However, many communes and production brigades still disobey orders and continue to open up small coal pits in a blind way and without permission.

He said: Now many countries in the world have formulated mining laws or regulations to protect coal resources and strictly prohibit damage to coal resources and waste in production. Our country has not formulated a mining law or a law to protect coal resources since national liberation. In order to strengthen legislation in the economic field and resolutely and effectively struggle against bad people, bad things and unhealthy tendencies which constitute damage and waste to coal resources, we must immediately draw up a mining law or a law to protect coal resources.

NATION'S PETROLEUM PRODUCTION PREDICTED TO DROP

HK301458 Hong Kong HSIN WAN PAO in Chinese 30 Dec 80 p 1

[Special dispatch by HSIN WAN PAO reporter from Beijing on 30 December: "Disrupting the Balance and Undermining the National Prestige: China's Petroleum Production Will Drop Consecutively for 7 Years. Output Will Drop by 5 Million Tons in 1981 and Fall Below the Output Level of 100 Million Tons in 1982; The Long-Term Agreement To Supply Japan Will Not Be Fulfilled; Equipment Blindly Imported Will Have To Be Sealed and Stored up While the Loans and Interest Will Have To Be Paid"]

[Text] Beijing, 30 Dec--Here is a piece of information that will disappoint 1 billion people for a short period of time: China's fanciful "petroleum take-off" has plummeted to the ground. According to an authority in Beijing, China's petroleum production will drop by at least 5 million tons next year. Production will further decrease in 1982 and the total output will be below 100 million tons. In addition, in the next 5 years to follow, petroleum production will continue to waver downward. China is rich in energy resources; however, we have not done enough work in the past regarding energy building and geological prospecting. Energy supply has lagged far behind the need of the whole economy; and about 30 percent of the country's production has failed to operate. As a matter of fact, petroleum geological prospecting work has failed to catch up because of excessive extraction. Hence, the peak of petroleum output will fall very quickly. We must wait until the development of the oilfields on the continental shelf along the coast is completed before there can be any improvement in the situation.

Shortly after the smashing of the "gang of four" in October 1976, the estimation of petroleum production was too optimistic. People thought that an output of 200 million tons could be very quickly attained and, therefore, a long-term trade agreement was signed with Japan to supply 15 million tons of petroleum in 1981 and 50 million tons by 1985. The agreement is now impossible to fulfill. Moreover, because of the estimation of a tremendous flow of petroleum, large amounts of chemical industrial equipment have been imported. Now that it has been discovered that there will be inadequate supply of crude oil, this equipment will have to be sealed and stored up. Nevertheless, the loans for that together with the interest will have to be paid.

Because of the excessive optimism regarding petroleum production, the extraction of coal has been slowed down. As a result, coal production will also fall next year.

Many large construction projects which consume a lot of petroleum have also been forced to be abandoned. Apart from financial reasons for which capital construction has to be cut down, some factories will also have to be closed to adapt to the energy supply situation.

The advocation of building more than 10 daqings has impaired a balanced economic development, adversely affected the people's livelihood and undermined the nation's prestige.

BRIEFS

POWER SUPPLY TECHNOLOGY MEETING--Tianjin, 7 Dec (XINHUA)--The third national annual meeting on power supply technology, jointly sponsored by academic organizations on power supply technology in Beijing, Tianjin, Shanghai and other localities, was recently held in Tianjin Municipality. Some 260 scientific and technological personnel specializing in power supply technology from the ministries and bureaus concerned as well as from all provinces, municipalities and autonomous regions attended and 121 papers were submitted. The meeting held that a national academic organization specializing in power supply technology should be established to promote the development of the technology, strengthen activities of technological exchanges both at home and abroad, strengthen the research on the technology and work out short-term plans for developing research. BRIEFS

SHORTCHANGE PREVENTION--Beijing, 15 Dec (XINHUA)--The State Standardization and Metrology Bureau on 12 December issued a circular calling on the standardization and metrology departments at all levels in China to check the accuracy of measuring and weighing instruments in local markets to prevent traders from shortchanging customers. The circular urges the standardization and metrology departments in various localities to join local price control and commercial departments in commodity price inspections and prevent disguised price hiking in the form of short sale. It suggests that standard scales and yardsticks be made available to the public in the markets and village fairs. [Beijing XINHUA Domestic Service in Chinese 1213 GMT 15 Dec 80 OW]

AQUATIC PRODUCTS PRICES--Beijing, 15 Dec (XINHUA)--The State Bureau of Aquatic Products on 13 December issued a circular calling on the departments of aquatic products at all levels to implement the State Council circular on commodity price control and join local people's governments in inspecting the prices of aquatic products. The circular demands that aquatic products be sold at list prices set by the state and prices higher than those listed must be lowered immediately. It bans unauthorized wholesale price hiking by local aquatic products departments. According to the circular, the aquatic products which can be sold at negotiated prices must be sold at prices no higher than their market price on 7 December 1980. The departments of aquatic products are urged to seriously check the negotiated prices and reduce those which are unreasonably high. FOREIGN TRADE

BRIEFS

FOREIGN TRADE--Beijing, 4 Jan (ZHONGGUO XINWEN SHE)--Speaking recently on foreign trade work, Vice Premier Gu Mu said that during the period of readjusting the national economy, the foreign trade departments must make positive efforts to help to serve the stability and development of the economy, and strive to fulfill the 1981 import and export plan. Gu Mu said, during the period of readjusting the national economy, the country must continue to increase production, reap bumper harvests in agriculture, and promote the light and textile industries and communications and transport. Hence, foreign trade must continue to grow and develop, and contribute to readjusting the national economy. [Text] [HK050257 Hong Kong WEN WEI PO in Chinese 5 Jan 81 p 1]

IMPORT, EXPORT WORK CONFERENCE--Beijing, 3 Jan--The second national imports and exports work conference was held in Beijing from 12 to 27 December. Over 200 people attended the conference, including leaders of central, provincial, municipal and autonomous regional foreign trade departments. The conference concentrated on studying how imports and exports work can serve the readjustment of the national economy, and also adopted positive measures with regard to future foreign trade work. The conference affirmed the progress resulting from the correct principle of opening up to the outside world. In order to expand foreign trade, the conference decided to fulfill the state import and export plans and arrange general targets for foreign trade, and also decided on criteria for export standards which must be strictly observed. It is also necessary to strengthen economic accounting and make efforts to reduce losses in foreign trade work. Guangdong and Fujian provinces have instituted a special policy and flexible measures in foreign trade. Beginning this year, these two provinces will be responsible for their own foreign trade transactions and their own profit and loss. The import and export companies set up in various places must be officially approved and must also run their business according to regulations. They are not allowed to cut across demarcation lines between different trades or arbitrarily expand their foreign trade business. [Text] [HK050254 Hong Kong WEN WEI PO in Chinese 5 Jan 81 p 2]

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Indexes to this report (by keyword, author, personal names, title and series) are available from Bell & Howell, Old Mansfield Road, Wooster, Ohio 44691.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

'JINGJI YANJIU' ON PLANNED REGULATION IN CAPITALIST COUNTRIES

HK080754 Beijing JINGJI YANJIU in Chinese No 10, 20 Oct 80 pp 12-18

[Article by Luo Yuanzheng [5012 0337 6927] of the World Economic Research Unit of the China Social Sciences Institute: "On 'Regulation by Planning Mechanism' of Capitalist Countries"]

[Text] All aspects of the problem of what means may be employed by China's national economic management to implement the policy of integrating regulation by planning mechanism with regulation by market mechanism are being closely investigated. The present article is an attempt to investigate how the capitalist countries are carrying out regulation by planning mechanism on the basis of a market economy, from which we may draw lessons for our own implementation of regulation by market mechanism under the guidance of planning.

I

In a capitalist society, on the one hand the entire society's production is required to harmonize, in an organized and planned way, with the development of the social forces of production and the progressive socialization of production; on the other hand, however, the capitalist system of private ownership causes the whole society's production to fall into an unorganized, unplanned and ungoverned state. The capitalist economic system has decided that the aim of its production is to seek a profit, and national economies depend to a large extent on the spontaneous development of regulation by market mechanism; the proportions of the entire society's production are renewed of their own accord in the midst of continual fluctuations and depredations. This kind of spontaneous movement spotlights the difference between socialized production and capitalism, and gives expression to the fundamental contradiction of capitalist society. Nevertheless, this does not amount to saying that a capitalist economy is entirely incapable of regulation by planning mechanism. In fact, "Capitalism has now directly evolved to a point where it has a highly planned form." (Lenin: "(Proclamation of) the Russian Social-Democratic Labor Party's Seventh Meeting of National Representatives, (the April Representative Meeting)," "Complete Works of Lenin, vol 24, p 274.)

First, there is the organization and planning of enterprise production. The form of capitalist production, as well as the historical role of the capitalist classes, consists of their adaptation to the demands of the development of the productive forces, concentrating and expanding the means of produciton, which were scattered amongst individual producers and small enterprises, founding enterprises on a huge scale and also instituting a planned distribution of labor within enterprises. Beginning from the 15th century, after passing through the stages of simple cooperation, workshop handicrafts and large-scale industry, powerful forces of production were created. This is the reason why factories which operated in a coordinated way, through the collective utilization of the means of production by a large number of people, were able to supplant small workshops. The latter process came about because this kind of "planned organization must be more effective than the haphazard distribution of labor; goods produced in factories where socialized labor is in operation must be cheaper than those produced by scattered small producer." (Engels: "Anti-Duhring" "Selected Works of Marx and Engels," vol 3, pp 309-310) This is to say that the capitalist economy, taken overall, is basically unplanned, but that within an enterprise it is, on the contrary, planned. Moreover, the planned nature of an individual capitalist enterprise, in step with the advance of science and technology, and in keeping with the 200 or 300 years' experience accumulated by capitalist management and administration, the modernization of capitalist enterprise management and the capitalists' strenuous efforts in subordinating their economic activities to the objective demands of the law of value, has further developed the planned nature of large companies and large monopolistic organizations, and has transcended national boundaries to develop into the planned nature of international corporations. In order to facilitate the profitable organization of production operations, the scope of planning is becoming increasingly extensive, its content is becoming increasingly comprehensive, and its different varieties likewise more and more numerous; since its methods are continually being improved, the quality of planning is also continually being raised. In the United States, for example, many large corporations formulate long term and short term plans: drawing on their long experience of creating new kinds of airplanes, new styles of automobiles and new chemical products, from the forming of a concept to starting up production, the Lockheed Aircraft Corporation, General Motors, and the DuPont Chemical Corporation have all worked out 5 or 10-year long term palns. The contents of these plans include important aspects and points relating to the manufacture of new products. After the long term plans have been drawn up, in order to adapt to market changes and new developments in science and technology, appropriate additions, revisions and supplements must be made to them every year. At the same time, these corporations strongly emphasize the integration of annual, quarterly and monthly plans in the formulation of their short term plans and stress that the plans should reach the units which have to carry them out before the start of the period to which they refer.

Second, it is not only enterprises and trusts which have internal planning; in the capitalist countries, certain ministries and departments also possess specific plans. Why is it that U.S. agriculture is so advanced? Apart from the existence of exceptionally favorable natural conditions, the U.S. has enormous experience in, and a whole series of methods for, developing agricultural production and carrying out agricultural modernization, and the U.S. Government's intervention in, and planned regulation of, agriculture has played a significant role in the development and modernization of U.S. agriculture. The U.S. policy in agriculture is admittedly the implementation of free regulation by market mechanism; nevertheless, the U.S. Government put into effect, at an early date, various plans to facilitate its intervention in or adjustment of agriculture. For instance, the adjustment of agricultural production was carried out by means of the formulation of a plan for the nation's overall cultivated area. Its contents are announced before the start of each year's sowing season. The extent of the cultivated area stipulated in the plan is calculated on the basis of requirements for domestic supply, net export and reserves. If a farmer voluntarily leaves fallow land which was used for growing a crop where a serious overproduction exists, if he is a participant in this plan and acts according to the terms of the contract, he may receive from the government a subsidy for his fallow land. The Department of Agriculture implements stabilizing plans in respect of many agricultural products: for example, if, after harvesting, selling conditions for an agricultural crop are not favorable, a farmer may decide not to sell this agricultural product, and use it instead as a pledge to raise a loan; in this case, the price of the pledged goods according to the plan will be higher than the market price. If the market price rises, the farmer can then sell the goods, and repay the original loan. If the market price remains lower than the planned price, then the farmer can transfer the pledged goods to the government at the planned price, in order to make good the original loan. Apart from these measures, the U.S. Government has also drawn up plans for foreign "aid" in grain, plans to safeguard agricultural resources, and management plans to safeguard the interests of consumers of agricultural products, in order to alleviate the "overproduction" crisis. All these plans have played a certain part in promoting U.S. agricultural development.

Furthermore, certain regulation by planning mechanism of the entire society's production has been realized. Modern capitalist production is highly socialized production, and certain proportional relations must necessarily exist in the reproduction of the society as a whole. It is only that its proportionality is brought into being through the spontaneous adjustments of the law of value. The correct level for such adjustments is often only apparent after the event, and also does not remain stable; this may be true to the extent that the equilibrium must be forcibly regained after critical disruptions have occurred, with the resultant crippling costs and enormous losses.

However, even at the stage of free-competition capitalism, bourgeois countries have intervened in a positive way in certain aspects of social production, so as to promote the development of the capitalist economy. They have decided the general legal scope of economic activities, upheld the capitalist system of private ownership, developed basic installations such as roads, bridges, canals, posts and telecommunications, and so forth, adjusted economic relations with foreign countries, with the aims of reducing the indiscriminate nature of the capitalist economy and allowing it to achieve a proportional development and reduce its losses in the milieu of free competition. For example, in the 19th century, in order to promote the opening up of regional economies, the U.S. Government encouraged the construction of railroads, stipulating that for every mile of railroad built, the railroad company was to be allocated ten miles of land, along both sides of the track, as well as a subsidy of $16,00-48,000. With the government's encouragement and assistance, U.S. railroad construction underwent a rapid development, so that in the latter half of the 19th century, five railroad tracks were constructed which spanned the entire continental United States, and the construction of railroads became the crux of U.S. economic development in the 19th century. Equally, the U.S. Government adopted sweeping politices to foster capitalist development, and in the 19th century it carried out the policy of protective tariffs, with customs duty as high as 40-50 percent, which effectively protected U.S. economic interests and encouraged the formation of a broadly based and unified domestic market in the United States.

In the closing years of the 19th century, with the rise in the degree of socialization of production and labor and the establishment of the rule of monopolistic capitalism, the capitalist classes were spurred on to the further use of state machinery to intervene in economic life and the modern capitalist economy had already reached a state in which it was no longer completely government-run. In the period of the First World War, in order that all economic activities might serve the aim of continuing the war, and so as to remedy the imbalance between resources and requirements, some imperialist countries took various positive steps to adjust their control of such things as production, the distribution of raw and processed materials and commodity prices, which was the embodiment of the phenomenon of large-scale state internvention in the economy. The imperialist period was no longer simply the era of big capital monopoly; it was also the period when monopoly capitalism was transformed into state monopoly capitalism. Its special characteristics were the integration of the enormous forces of the state and of capital into a single structure, the integration of the people in their multitudes within the production relations of state monopoly capitalism, the assumption by the state of certain functions of economic organization, and the implementation of fairly good regulation by planning mechanism in the economic life of the society as a whole; it was one of the important manifestations of state monopolism.

The economic crisis which first broke out in the U.S. in 1929 engulfed the entire capitalist world. In order to deal with the serious economic crisis and the threat of imminent revolution, the newly-elected U.S. President Roosevelt launched his so-called "New Deal" as soon as he had been sworn in, in 1933. This was an attempt to rescue the U.S. from the crisis by means of state measures for the "regulation" of the economy. Its general methods thus consisted of comprehensive state intervention in economic life, the strengthening of state monopoly capitalism, and the implementation of a series of measures for regulation by planning mechanism. Significant measures were the devaluation of the U.S. dollar, the abolition of the free exchange of paper currency for gold, the control of commodity prices, the limitation of private production and investment, and the absorbtion of a great number of the unemployed into public construction projects through the allocation of funds from the Federal budget; in the agricultural sector, an "agricultural reorganization bill" was put into effect, through large-scale state purchase of agricultural products, the area of land under agricultural cultivation was reduced, and agricultural compensation paid out, and so on. The U.S. propaganda organizations called Roosevelt's "New Deal" a kind of "planning" to ensure flourishing production, and asserted that the United States, under the "New Deal" would have "planned capitalism with no crises." This was, of course, a propaganda strategem, but certain of the planned readjustment measures taken under Roosevelt's "New Deal" really did achieve results, within a specific period and in certain fields, bringing about temporary economic recovery, and strengthening the dominant position of monopolistic organizations.

In his discussion of the historical position of imperialism, Lenin made a thorough analysis of certain new conditions which appeared after the occurrence of the great rise in the level of socialization of production, during the stage of monopolistic capitalism. These conditions included the enormous increase in size of the large enterprises--according to accurate estimates based on a large mass of data, they obtained possession of two-thirds, or even three-quarters of the total raw materials essential to the masses of American citizens; the transportation of these raw materials to the most convenient production sites was carried out in a planned way, (sometimes the distance between materials and production site was several hundreds, or even several thousands of li); all the various working procedures involved in the production of a large range of goods, from the processing of raw materials right up to adding the finishing touches, were directed from a single nodal point; the distribution of these products to the consumers in their tens and hundreds of millions was effected in accordance with a plan. All these conditions reflect the objective process of the increase in planning in the wake of the development of the social forces of production during the stage of monopoly capitalism. In some Western capitalist countries, a certain level of regulation by planning mechanism of the entire society's production and distribution, carried out by the state on the basis of market effects, has now become a new characteristic of the present-day capitalist economy.

II

After the Second World War, several important capitalist countries, such as France and Japan, vigorously promoted economic planning, and widely practiced state planning and regulation on the basis of the capitalist market economy. This had a tangible effect on the recovery and development of their national economies. Between 1947 and the present, the French Government has drafted and carried out seven consecutive medium term economic plans, and is due to start the implementation of the eighth next year. In the 10 years immediately following the war, the Japanese Government successively drafted more than 10 informal plans. Starting from 1955, Japan formulated nine official medium term plans, and is now in the process of carrying out a new economic and social 7-year plan (1979-1985).

The fundamental reason why postwar France and Japan, among other important capitalist countries, have put into effect economic planning, was to attempt to find a solution to the consequences of the increasingly acute internal and international contradictions inherent in modern capitalism. This economic planning has four important aims:

First, to resolve postwar economic difficulties by relying on their national economic strengths. To take France as an example, its economy was seriously disrupted in the course of the Second World War; there were serious shortages of raw materials, fuel, foodstuffs and housing, the currency was inflated, communications were paralyzed, and production installations and methods were obsolete. Under these conditions, the only way to effect a quick economic recovery was to rely on national strengths. Thus there was an urgent need for the government to formulate national plans, so as to quickly revive the economy. France's first economic plan (also called the Monnet Plan), was a plan covering the years 1947-1953 for the rebuilding of France and its economic recovery. By 1953, the French economy had not only completely recovered, but certain aspects had improved considerably compared to the prewar period. Between 1946 and 1955, Japan also drew up a total of more than 10 informal plans including the "Plan for Economic Revival" and the "3-Year Plan for Economic Self-Sufficiency." The Japanese Government took as the objective of its central plan the implementation of a "biased production pattern," emphasizing support for the development of basic industries such as coal, electric power and artificial fertilizers, as well as various other kinds of powerful policies and measures, promoting the rapid recovery of the economy. By the beginning of the 1950's, the Japanese economy had already regained its prewar level.

Second, to quickly develop the economy, promote modernization, and consolidate the rule of monopoly capital, by means of economic planning. Even during the Second World War, the French Resistance movement advocated postwar reform of the social economy, state organization of the economy, and the formulation and implementation of national economic plans, in order to remold France's economy and to raise the nation's political and economic position. Just as France's former Prime Minister M. Chalan-Delmas said, the goal of France's plans is "France's independence"; "France must make use not only of military methods for self-defense, but must also defend itself particularly by means of economic expansion." This requires that the state should carry out even more economic functions and that the state's role in economic regulation and intervention should be increased in order to direct the development of the economy towar predetermined planned goals. Between 1956 and 1973, Japan effected a swift expansion and modernization of its economy. During this stage of development, Japan formulated a total of six medium and long term plans, including the famous "Plan for the Doubling of National Income" (1961-1970). The aim of this plan was to transform the state of affairs in which Japan lagged behind other leading capitalist countries in science and technology, industrial structure, production levels, economic results, solving the severe and protracted postwar unemployment problem, achieving full employment and also bringing about a rapid rise in national living standards. On the basis of having solved these two big problems, the Japanese Government gradually altered the direction of development of its medium and long term plans, making a clear change away from its former simple "economic development plans," to "economic and social development plans." It increased plans for "social" development, exploiting talent, transforming the state of affairs in which public facilities lagged behind the development of production and the improvement of life, emphasizing cultural facilities, conservation of the environment and social welfare.

Third, to try to redress the undiscriminating nature of markets, to prevent the harmful effects of the market on the social economy, and to reduce the drawbacks of spontaneous market regulation by mark mechanism. The late President de Gaulle of France indicated that the aims of French economic planning were "to mold the scattered and multifarious types of production into an integral whole," "to make good the defects of freedom, while ensuring that its good points are not lost." Plans "must not suppress the pioneering spirit, must not inhibit competition nor damage equitable profits," and they should act as a kind of "lever" to promote "the realization of a high production rate" in the business world, "causing all enterprises to join together, and setting them an example for competing in overseas markets." Some French economists look on planning as a "tool for regulation by market mechanism." In general terms, France's planning is not the state domination of the economy, but is rather an attempt to use and control markets by economic means, according to a plan, and on the basis of the market economy. The functions of planning lie in the analysis and prediction of economic trends, the expression of the state's socio-economic policies and the direction of development it proposes to take, and the use of economic measures to influence the economic activities of state-run industries, private enterprise and individuals.

Japan's regulation by planning mechanism also has its foundations in the market economy; by means of comprehensive forecasting, its medium and long term plans provide a clear impression of the direction and overall appearance of economic and social development, and its government similarly uses economic measures to guide the progress of private enterprise in the direction indicated by the plans, so as to reduce the indiscriminate nature of economic development. This is an important reason for the emphasis which is at present being put on market surveys, market analysis and market forecasting in the West. It also accounts in some degree for the rise of "economic prediction," and "futurology."

Fourth, to serve as a measure for combating economic crises, and insuring stable economic progress. For example, in the 30 years following the war, the Japanese Government's investment in public industries in years of economic crisis far exceeded that in years when there was no crisis; in other words, the growth rate of government investment at all times formed a counter-trend to changes of the economic cycle. In years of crisis, when there was a fall in production in the mining industry, the scope of government investment always increased. According to Japanese statistical data, in crisis years, the amount of government investment shows an increase of about 20-30 percent over that of the previous year, while in crisis-free years, the increase over the preceding year is only around 10-20 percent, and for certain years the increase is even smaller.

Important ways in which regulation by planning mechanism has been realized in capitalist countries are as follows:

First, state budgets and government investment are the direct methods of carrying out regulation by planning mechanism. In France, the state budget and the social welfare funds allocated by the government at present account for approximately half of the national income, and the direct expenditure on investment allowed for in the national budget constitutes about one quarter of the total national investment; if loans extended from state funds and all forms of subsidies are added to this figure, it then constitutes roughly 50 percent of the total national investment. As a further example, government allocations annually accounted for 20-25 percent of the national income during 1946-1977. The funds needed for the expansion of the heavy chemical engineering industry in postwar Japan were raised mainly through government investment and loans. According to statistics, postwar public investment by the Japanese Government increased at a much faster rate than did private investment. In the years 1960-1976, private investment increased 7.5 times, while government public investment increased 11 times. The government investment was used mainly for machinery, construction of factories, for harbors, railroads and waterways of various sizes, and for similar production facilities. These investments, funded by the state budget, necessarily affected and regulated the market activities of Japan's means of production, increasing the demand for steel, cement, timber, machinery and other means of production, and thereby guiding the economic activities of private enterprise onto the course prescribed by economic planning.

Second, economic policy is a significant means of guiding the economy, regulating markets and putting plans into effect. In practice, it is clear that capitalist countries can, to a certain extent, regulate the building up of construction and the fluctuations between supply and demand in markets by means of economic policies covering tax revenue, subsidies, awards, credit, foreign exchange, currency, prices and so on; through policies on energy resources and technology, they are able to guide the exploitation of resources, make use of new technology, and improve production conditions; by means of policies covering workers' wages, social welfare, savings and so forth, they can regulate employment revenue and consumption levels. The various policies directly and indirectly regulate and influence the economic activities of businesses and individuals, and, to a certain extent, suit them to the requirements of planning. For example, in France, if an enterprise undertakes a project planned by the state, the state will supply funds under the terms of a "planned contract," and will also give preferential treatment to the enterprise, in the form of loans, subsidies, tax reductions or remittances, and so on. Since the 1950's, a special credit system has been in operation in Japan, whereby the government, acting through the Bank of Japan, stipulates the number of loans which may be issued by individual commercial banks, and decides their management orientation, so as to control the economic activities of enterprises, and to insure that enterprises' policy decisions are in keeping with the requirements of economic planning.

Third, the far-reaching recruitment of representatives from all walks of life to participate in the forecasting of market trends and the formulation of economic plans. For instance, in the drawing up of its plans, France places much emphasis on recruiting representatives from the world of business, the trades unions, farmers' organizations and the consumers to take part in planning work, and formulates its plans on the basis of forecasts and consultations, thereby causing planning to be better suited to the markets, and making the two complement each other better. Thus the French Government's emphasis on consultation has always been fundamental to France's planning. Japan's economic planning takes the form of the prime minister seeking advice; the prime minister's requests for advice are answered by the Economic Advisory Commission, (the center for drawing up plans, a subsidiary body of the economic planning board). When the Ikeda cabinet was drawing up the "Plan for the Doubling of National Income," the Economic Advisory Commission formed four subcommittees and eventually set up a further 16 special committees to deal with the allocation of investment capital, the communications system, land and water conservancy, energy policy, wages and employment, living standards, and so on. Prime Minister Ikeda appointed 239 committee members, among whom were entrepreneurs, economists, newsmen and trades unionists. Experts on Japan believe that using the method of advice and consultation has three main functions: 1) it makes possible the pooling of wisdom, as well as the full use of the learning, experience and powers of judgment of the committee members; 2) it allows speedy attention to be given to all manner of suggestions, and the consultation of the interests of all the various members of the committees, and 3) it allows the members to gain an understanding of, and to support, the objectives and policies of the plans, through formulation and consultation.

Fourth, the establishment and consolidation of all kinds of organizations, funding organizations and functional companies for the implementation of plans. For example, apart from carrying out planned adjustment through the various government departments, the planning commission, and state financial bodies, France has also set up all kinds of funding organizations and functional companies to form an implementation structure for regulation by planning mechanism. There are organizations for the funding of economic and social development, territorial reclamation and improvement works, and the preservation of nature and the environment, and so on. As for the functional companies, there are national equipment companies (companies for promoting regional construction), a central real estate company (to assist regional basic construction), land reclamation and rural construction companies (which are responsible for the purchasing of waste land, the concentration of landholdings, and the improvement of the farming structure), and so forth.

Fifth, the drafting of economic laws and the stipulation of criteria for economic activities, insuring the implementation of plans. Economic legislation is the concrete manifestation of economic policy and only when a strong and complete legislation exists for intervention in and supervision of economic activities can the effective enforcement of economic plans be guaranteed. In Japan, when a solution to important problems arising in the formulation of economic plans has been reached through investigation and research, appropriate economic regulations are drafted, or existing ones revised, for the allocation of funds. Thus, in the formulation of the "Plan for the Doubling of National Income," almost 90 proposed laws were drawn up or amended to facilitate the coordinated execution of the plan. France has formulated laws covering almost the whole spectrum of economic activities in order to promote the execution of its plans; for instance, there are trade laws, factory laws, labor laws, laws on agricultural policy and for environmental protection, social laws and others.

Economic planning has played a positive part in the postwar economic recovery, adjustment and reforms of Japan and France. Because the plans are in general of a directive, predictive and consultative nature, and also because they stress amendment and adjustment during the process of implementation, they are able to harmonize the interests of the state and of private enterprise at different levels and promote economic development. With a combination of guidance through economic planning and favorable conditions at home and abroad, Japan's gross national product achieved an average annual growth rate of 9.8 percent between 1955 and 1973, and of 19.8 percent during 1960-1970, higher than any other capitalist country in the same period. Japan's national income in 1958 represented only 7 percent of that of the United States, 51 percent of Britain's, 60 percent of West Germany's, and 70 percent of France's; by 1967, Japan had already overtaken France, West Germany and Britain, and had transformed itself, in a single leap, into an economic power second only to the United States in the capitalist world. From the point of view of the results of carrying out the plans, thanks to the use of scientific methods in drafting them, of Japan's eight medium- and long-term plans since 1955, six have been completed ahead of schedule or have overfulfilled their targets; only the "New economic and social development plan," and the "basic plan for the economy and society," are excluded, since they have not yet been completed. For the "5-Year Plan for Economic Self-sufficiency" of 1956-1960, the "New Long Term Economic Plan" of 1958-1962, the "Medium Term Economic Plan" of 1964-1968, and the "Economic and Social Development Plan" of 1967-1971, the average annual proportional economic grwoth rate was planned to be, 5, 6.5, 8.1 and 8.2 respectively, and in fact the effective results were 9.1, 10.1, 10.8 and 12.3 percent (1967-1970). Between 1952 and 1974, France's GNP increased twofold, with an average annual increase of 5.2 percent, while its average annual increase from 1960-1972 was 5.8 percent, surpassing that of West Germany, Italy, Britain and the United States and second only to Japan's. The results achieved by France's plans were very similar to those of Japan. From the above information, it is clear that there is a very close connection between the postwar recovery and rapid development of the French and Japanese economies and the guidance and regulation provded by state planning. We may say that the above results would have been very hard to attain without powerful state intervention and without the unremitting promotion of economic planning over a long period.

It must be emphatically pointed out that there are differences in principle between the regulation by planning mechanism of capitalist countries and that of socialist countries. First of all, the economic plans of capitalist countries are formulated by the bourgeois government and the monopoly capitalist class; their aim is to serve the interests of the monopoly capitalist class, and profit is the motive for its decisions. Wheneven sharp conflicts arise between regulation by planning mechanism and profits, state planning gradually loses its guiding role in private economic affairs, it cannot obtain the support and cooperation of the monopoly capitalist class, it becomes increasingly difficult for the state to use economic measures for the planned regulation of economic activities and suggestions for full recovery and for reliance on regulation by market mechanism are completely ignored. On the other hand, the regulation by planning mechanism of socialist countries serves the basic interests of the working people. Second, despite the fact that capitalist state planning is capable of different degrees of intervention at certain periods and in certain areas of the process of social reproduction, and even of using plans as a kind of measure to combat crises and temporarily relieve contradictions, nevertheless it cannot eliminate the basic contradictions of capitalism; neither can it eliminate chronically-recurring economic crises. The frequent outbreak of economic crises in the postwar capitalist world is proof of this. Especially since the 1970's, there have been great upheavals in international financial markets, competition for markets has been severe, the measures at the disposal of state planning have been heavily limited and, under the onslaught of the world economic crisis, even Japan and France have not been able to carry out their medium and long term plans on schedule. On the other hand, under the socialist system, given a correct line, a correct general policy, and scientific methods of application, all the various kinds of economic contradictions can be resolved, and national economies can be developed, in a planned way, at a proportionally higher rate. Further, however large its scope of application, capitalism's regulation by planning mechanism cannot achieve an overall balance throughout the whole of society. This is because, however wide the scope of capitalist enterprises and trusts, and however high their level of socialization, in the final analysis they remain private owners with radically opposed interests. No laws or policies are capable of fundamentally reconciling their conflict of interests, nor of fundamentally uniting them, coordinating the entire society's production and bringing about an overall balance. In the pursuit of profits, capitalists are prepared to ignore any sort of social needs, coordination of production and legal norms. They will of necessity destroy all these things in the pursuit of their own objectives. Moreover, as a result of the broadening of international economic relations, the increasing intensity of competition in international and domestic markets, the implementation of regulation by planning mechanism within the confines of a single country is becoming more and more difficult.

III

Even though differences of principle exist between the regulation by planning mechanism of capitalist countries and that of socialist countries, the socialist economy nevertheless has similarities with the capitalist economy in the two fields of socialized production and commodity production. In the course of several hundred years, the capitalist classes have accumulated rich experience in these two fields. We can and should learn from the experience of the capitalist classes in operating commodity production with a fairly high degree of socialization. As Lenin has said, only those who understand that it is impossible to create or implement socialism without learning from the organizers of trusts are worthy of being called communists. We should learn from the experience of capitalist countries, accumulated in the course of 200 or 300 years, in the field of microeconomic management, and we should also learn from the experience they have accumulated in relation to market adjustment and a certain degree of regulation by planning mechanism in the field of macroeconomics.

I believe that it is worth our while to study, and draw lessons from, the experience of capitalist countries in carrying out certain levels of regulation by planning mechanism on the basis of regulation by market mechanism, especially in the following three areas:

First, the regulation by planning mechanism of the capitalist countries attempts to avoid negative market effects. Their medium and long term plans embody certain macroscopic goals, and are plans of a strategic and guiding nature. Their macroscopic plans, from one point of view, supply guidelines for the market, and strive to correct the indiscriminate nature of the market and to prevent the disruptive effects of the market on society; from another point of view, they concentrate on not restricting the positive role of the market. Some French economists who have held important offices in certain government economic and planning departments believe that the planned guidance of markets and the market's insuring of the balance between supply and demand are not mutually exclusive functions. The favorable effect of safeguarding the free play of market mechanisms in no way hinders the large-scale effect of bringing state planning into play. The initiative of enterprises will only be restricted if the intervention of the government or planning in the economy is too great, or if their control of the economy is too strict, or when serious bureaucratism occurs in government departments, when there is an excessive number of rules and regulations, or when taxes are too heavy. In the same way, only when state plans fail to provide proper guidance in a particular field, or if they have not stipulated objectives and measures which must be fully carried out, will spontaneous market effects spread unchecked. If would appear that the object of economic intervention through macroscopic planning by capitalist countries is to allow capitalist economic laws, including the law of value, to be brought fully into play, and not to build up dominance over the economy or work it to death. We should examine and learn from the experience of capitalist countries in this field, strengthen planned guiance, give full rein to positive market effects and bring about a better integration of regulation by planning mechanism and regulation by market mechanism; we should also insure that our plans accurately reflect the demands of the law of value.

Second, in the execution of their plans, the capitalist countries rely primarily on economic measures, economic policies, and economic legislation, and not on administrative measures. Their plans in general have the nature of guidelines, and not of orders. Thus they exercise a certain restraint on state-run enterprises and on relevant government departments. We should study and absorb their experience of using economic measures, economic policies and economic legislation, and we should pay even more attention to studying their financial and monetary policies, and certain of their policies in the fields of technology and economics, such as energy resources policies and environmental policies, as well as those policies which, like the anti-trust legislation, oppose monopolies, safeguard competition, and make use of regulation by market mechanism, and we should do this in order to smash all kinds of economic blockades, and to strengthen and develop China's unified domestic markets.

Third, even though the capitalist countries, in drawing up their plans, cannot bring about the same overall balance which is achieved by socialist countries, nevertheless, in the areas of improving planning methods and strengthening economic intervention and the economic balance, they possess much experience from which lessons may be learned. Thus, in formulating the "Plan for the Doubling of National Income," Japan worked out a balance between reserves and investment, a balance between income and expenditure in finance, a balance between income and expenditure in foreign trade, a balance betwen individual income and expenditure, as well as the all-important balance between toods and materials. In the formulation of the "Medium Term Economic Plan" in 1965, a macroeconomic model was used which consisted of 300 equations and took into account 100 external variables. France also makes use of various kinds of models for economic calculations in drawing up its plans, such as material-finance models and models of the performance of many departments. Since the 1970's, the United States and other important capitalist countries, in order to coordinate certain international economic activities, have begun to construct international macroeconomic models, and are even integrating the economic models of various countries, to form a "global model." We should also study, and make selective use of, some specific methods adopted by the capitalist countries for the formulation of plans, such as, for example, their methods of starting up production, their various kinds of economic calculation methods, laws of comparative economics, optimization methods, and so on, with the aim of raising the standard of our planning work; at the level of individual economic units, economic accounting may be strengthened, and economic results improved.

NATIONAL POLICY AND ISSUES

BEIJING ECONOMIC JOURNAL ON EMPLOYMENT PROBLEMS

HK031112 Beijing JINGJI YANJIU in Chinese No 10, 20 Oct 80 pp 31-37

[Article by Feng Lanrui [7458 5695 3843] of the Marxism-Leninism-Mao Zedong Thought Research Center, China Institute of Social Sciences, entitled: "Six Aspects of the Problem of Employment"]

[Text] The employment problem is a social problem of great significance facing China at present, and it is also an important theoretical problem. By means of a multiplicty of plans, and by opening up all available channels, the party Central Committee and the departments concerned have, since last year, found employment for a large number of people. In oder to better resolve this problem in the future, we must make further investigations on the basis of theory, general principles and policies, integrated with practice. This problem involves a wide range of aspects, and is relatively complicated. In this article, I shall only offer some rather superficial opinions of my own relating to the following six problems.

1. Is It Possible To Eliminate Unemployment in a Socialist Society

Neither Marx, Engels nor Lenin provide a direct answer to this question. Nevertheless, from their various discussions, it becomes clear to us that, in the first stage of communism as envisaged by them, that is, the socialist society, the phenomenon of unemployment does not exist. Socialism came into being as the antithesis of capitalism, on the basis of the productive forces having reached a high level of advancement. In the socialist society, the means of production are owned in common by the whole society, all the members of society are the owners of the means of production, everyone has the obligation to work and the right to work and the phenomena of exploitation class, crises and unemployment do not exist. In dealing with the elimination of exploitation, Marx emphatically discussed the obligation to work; at several points in his writings he said that "every man must work." ("Complete Works of Marx and Engels," "Introduction to 'Wage Labor and Capital,'" vol 22, p 243) Marx also said: "The conditions of oppression existing at present should be eliminated by means of transferring all the instruments of labor to the producers, thus suiting every physical force to the working people, in order that they may work to insure their own existence." ("Complete Works of Marx and Engels," "In Commemoration of the Seventh Anniversary of the Formation of Communist International," vol 17, p 468) It is evident that (to a group of people such as oppressors and idlers) labor can even be an obligation which contains an element of compulsion.

In his writings, Lenin also discussed the obligation to work and the right to work. He summed up the socialist principle proposed by Marx in the phrase: "He who does not labor, does not eat." ("Complete Works of Lenin," "On Famine," vol 27, pp 365-366) In his essay "A Marxist Discussion of the State," after the sentence, "the distribution of consumer goods 'has a proportional relationship with' the amount of labor supplied to the society by each person--in the lower-class stage ('first phase')," Lenin used triple brackets to draw particular attention to the following: "This is also a form of compulsion: 'Anyone who does not work, does not have food to eat.'" (Lenin: "A Marxist Discussion of the State," People's Publishing House 1964 edition, p 33) What is stressed by these words is opposition to exploitation, and emphasis that labor is an obligation which must be fulfilled by everyone. Lenin also discussed the right to work. He said, "All citizens have the equal right to use the public means of production, publicly owned land and factories, and so on, in order to carry out labor." ("Complete Works of Lenin," "A Liberal Professor on Equality," vol 20, p 130) From this we can see that the socialist society envisaged by Lenin is similar to that envisaged by Marx and Engels, where the phenomenon of unemployment does not exist. Not long after the October Revolution, Lenin wrote an essay which dealt directly with unemployment. In it Lenin indicated that unemployment was caused by imperialist wars, and was not inherent in socialism.

Stalin bluntly stated that there was no unemployment in a socialist society, and moreover he held that the stage had been reached in which there was no unemployment. At the 16th Congress of the Communist Party of the Soviet Union in 1930, during the Soviet Union's transition from capitalism to socialism, Stalin said, "There are approximately 1 million unemployed in the Soviet Union," but that, under the Soviet system, the number of unemployed was being steadily reduced. He also said, "Up to the 30th April of this year, the number of unemployed had already been reduced by more than 40 percent." ("Completed Works of Stalin," "Political Announcement of the Central Committee of the CPSU to the 16th CONGRESS," vol 12, p 257)

By 1934, Stalin could announce, at the 17th Congress of the CPSU, that unemployment had already disappeared. "We no longer have any working people who are unable to find work, or who are unable to earn a wage." ("Complete Works of Stalin," "Summary of the Work of the Central Committee of the CPSU, Given at the 17th Party Congress," vol 13, p 297). In a 1936 report the draft constitution of the Soviet Union, Stalin said: "We now have a new socialist economy in which the occurrence of crises or unemployment, poverty or bankruptcy is not possible." ("Selections from Stalin," "On the Draft Constitution of the Soviet Union," p 85) In this same report, Stalin announced that the Soviet Union had already basically realized the first stage of communism as envisaged by Marx.

To summarize what has been said above, the views of the classic Marxist writers are basically in complete accord. In the first stage of the communist society, (that is, the socialist society), because the private ownership of the means of production has been abolished, and the public ownership system established, every worker has the right to use the publicly-owned means of production in order to carry out work, and, at the same time, has the obligation to work for society, and thus the phenomenon of unemployment can be eliminated.

In the initial period of China's liberation, there were 3 to 4 million people out of work, a legacy bequeathed to us by the old society. China's Government adopted the methods of "providing for and helping ourselves through production," and "providing work as a form of relief," and had basically solved the unemployment problem within 3 or 4 years. During the period of construction covered by the first 5-year plan, all the previously neglected tasks were being undertaken, and large-scale basic reconstruction was in progress, so that there was no problem of people waiting to be assigned work. At the time of the "Great Leap Forward" in 1958, the strange phenomenon arose of there not being enough available labor. In the 1950's, China regarded herself as a state where there was no unemployment. By the 1960's, the problem was gradually becoming apparent, and we began to feel the pressure imposed by this employment question. After 1967, great numbers of educated youths, responding to the party's call, went out to mountainous and rural areas, with the result that the problem of those waiting to be assigned work was covered up under various policies and measures. In the last few years, because the capacity of the rural people's communes for absorbing labor has reached the saturation point, because a large proportion of the young people who went out to mountainous and rural areas have returned to the cities, and because industrial and mining enterprises in towns and cities are at present already overstaffed, as well as for other reasons, finding employment for laborers has become a social problem of the utmost importance. Last year, employment was found for 9 million people, through the positive efforts of the party and the government. Within a certain number of years, 6 or 7 million young people and students are expected to enter the ranks of those waiting to be assigned work every year. It would seem that another period of bitter struggle will be required to resolve the employment problem.

The reason for the existence of unemployment in China's society are complex. Below are some important aspects:

First, since the 1950's, China's population increase has been out of control, and has far outstripped the requirements of economic development for laborers. Over the past 30 years, our natural population increase has reached an average of as much as 20 per 1,000 while the world average proportional increase is 17 per 1,000 and that of the world's advanced countries is only 7 per 1,000; our figure is far higher by comparison. Moreover, the base figure for our population is very large, even though our proportional rate of increase is similar, the actual increase is higher than that of other countries. China's population has increased from 540 million people in 1949 to 970 million in 1979. During this period, having suffered from the disruption of the "left" deviationist line and from 10 years of great chaos, China's economic development had been brought to the verge of bankruptcy by the time of the fall from power of the gang of four. This is the fundamental reason for the existence at present in China's society of such a large number of people who are waiting to be assigned work.

Second, the implementation over the past 30 years of a highly concentrated overall management system, has not been advantageous for solving this unemployment problem. If we take the most direct system of labor management, then, under a highly concentrated system which is all-embracing, those waiting to be assigned work can only "wait" for assignment, they are not permitted to look for jobs. Unless one is able to "get in by the back door," he will have to wait for assignment; there is absolutely no other alternative. One cannot move to another area, due to the restrictions imposed by the relation between the number of households, the total population and the food supply. It is even less likely that one can go to look for work in another place. No industrial or mining enterprise or institution is able to recruit personnel according to the requirements of its work tasks since norms are transmitted to lower levels by the labor departments, and personnel are assigned to work by the regional labor department in the place where they live, so clearly, enterprises are not permitted to recruit and employ qualified personnel wherever they can find them. The multitude of stipulations and restrictions give rise to the contradictory state of affairs where, on the one hand, many people do not have a profession and, on the other hand, many jobs remain unfilled. The widespread and serious nature of this situation where people have to wait to be assigned work, caused by the unsuitablity of the system, is of no less significance than the problems described in the preceding paragraph.

Third, there is the situation in which people have to wait to be assigned work, this time caused by the too rapid transformation of the production relations. For many years, we have cut ourselves off subjectively from the real conditions of the productive forces, and have continually altered the production relations, striving to make everything "large" and "public," and have emphasized the transition of small collectives into big collectives; thus we have restricted and cut out the individual economy, to such an extent that some workers have drifted out of production to become an idle labor force in society. Moreover, this has cut off one newly perfected means of finding employment.

Fourth, there is the situation in which people waiting for work are in the process of selecting their occupations. Under the policy where the state ownership system is "an iron ricebowl," [meaning job security] people waiting for employment have necessarily choosen state run enterprises and over those of the collectives. Even if the salary is a littler lower, they still prefer to go to a unit under the state ownership system, rather than to one under collective ownership; still less do they wish to engage in individual labor. Some people also want to make a choice between all the different businesses and industries, and to choose between areas, which makes the period they spend waiting for assignment even longer.

Does the actual situation of the existence of a large number of people in China who are waiting to be assigned work contradict the Marxist theory relating to the elimination of unemployment in socialist societies? The answer to this question is negative.

After surviving rigorous trials and tribulations, China's socialist system has established its dominance. In the economic field, "the poverty and blankness" in resources, bequeathed to us by old China, has been radically altered, and independent, relatively complete systems of industry and national economy have been set up. However, because the resources bequeathed to us by the old China were, in the last analysis, too "poor" and too "blank," because we suffered, for a comparatively long time, the disturbances caused by the "left" deviationist line, and did not come firmly to grips with the central task of economic construction, and, particularly, as a result of the 10 years of great calamity caused by Lin Biao and the gang of four, for all these reasons, our present socialist system is separated by quite a considerable distance from the first stage of the communist society envisaged by Marx and Lenin, or from the "complete" and "advanced" socialism discussed by Lenin.

Under these circumstances, it is impossible both to guarantee full employment and to eliminate the phenomenon of people having to wait to be assigned work. On one hand, we must strive to solve the employment problem, and on the other hand we must realize that, in the present historical stage, the requirement of eliminating the wait for work assignment is excessive. We cannot make demands on the present which are based on the standards of the complete and advanced socialism of the future, and this applies to the employment problem as much as to any other. Naturally, this does not mean that the phenomenon of unemployment must necessarily exist in all countries in a stage of socialism which is still not complete or advanced. In fact, in some countries which are in a stage of socialism that is not yet complete or advanced, there is no unemployment at all, but rather a labor shortage. This is a point which is determined by each country's specific conditions, and on which generalizations cannot be made.

3. The Confusion of the Concept of Employment, Its Causes and Its Results

Although we admit that the phenomenon of having to wait for work assignment is unavoidable in China's present stage, this does not mean that we adopt a negative attitude to solving this problem. On the contrary, we are squarely facing up to this problem, so as to be able to conduct thorough research into its solution.

Last year, we found jobs for 9 million people throughout the country, which was a great achievement. However, it also brought to light several problems, and first among these was the confusion of the concept of employment.

What is employment? Many people would answer simply that employment is the provision of jobs within the system of ownership by the whole people and within large collectives, (such as big stores and big factories), which approximate the system of ownership by the whole people. However, many people would not wish to admit that finding jobs for people in small neighborhood collectives, or in cooperative groups, is also employment; even less would they be prepared to admit that employment can mean individuals finding a means of livelihood for themselves, practicing handicrafts or offering servies in a small way, or starting up small capital business ventures, even though the people who do find work in these ways all have work to do, earn a regular income, and support themselves and their families. For instance, last year a large number of small economies sprang up in Wuhu Municipality, and among thesewas a company which sold only stewed duck, but which all the same had several hundred stalls, and involved more than 1,000 people. Some were partnerships composed of a few young people, while some were run by one person employing his entire family; the earnings of one person from this kind of business is enough to support 2 or 3 people. Last year, Wuhu had several thousand of these kinds of small cooperative groups, individual small retailers, and individual handicraft industries, all of them individually responsible for their own profits and losses. Between them, all the various businesses have all the goods one could hope to find. They sell a remarkable variety of goods, and offer a complete range of services. They are convenient for the masses, and represent a thriving market. The products of many individual manufacturers is also high; in Wenzhou, for example, some shops selling leather shoes have merged, but there are still 40 of them, concentrated along one street, whose products are in great demand in Shanghai. The production price of each pair of shoes is roughly 10 yuan, while the selling price is between 12-17 yuan.

These cooperative enterprises and individual economies have absorbed a very large number of people who were waiting to be assigned work, including a proportion of young people awaiting assignment, which has solved their own and their families' living problems. Nevertheless, from the social point of view, it is still not admitted that these people have found employment, and even they themselves do not admit that they have found jobs; rather, they are "waiting for jobs to be found for them." This situation is to be found in all areas, under different names; it is sometimes called "temporary assignment." There is another aspect to the prbolem, in that because some enterprises do not have specified production duties, "they are not producing enough goods to pay wages." As long as this fact is recognized by the government, it can still be considered to be employment. The situation of several so-called "neighborhood factories" in Wenzhou is of this nature.

Why was it possible for the concept of employment to become so muddled? First, this happened as a result of our employment system. For a long time, the labor force has been treated as a whole, and allocated in a unified manner to state-owned industrial and enterprise units or to state institutions, and so, in the course of time, the notion has developed that one only has proper work when one has been sent to a state-owned industrial or enterprise unit, and can thus hold out one's "iron ricebowl." Small collectives have no "iron ricebowl," nor any economic guarantee, and thus cannot be considered as supplying proper employment. As for individual labor, sometimes called "going it alone," it is always the object of reform and suppression, and of course cannot be considered proper work. Second, it was a result of the labor policies and methods of doing things which are in force at present. During the process of assigning jobs last year, some regions, in respect of the assignment of young people to employment in small collectives, made the stipulation that these young people should "not be prevented from entering a school of a higher level, not be prevented from enlisting in the army, and not be prevented from working in factories owned by the whole people," which was called by some the "preservation of the three rights of recruitment," (the rights enjoyed being, namely, to be recruited as a worker, to enlist as a soldier, and to enroll as a student); this was another cause for the confusion over the concept of employment. If, after they have been found employment, young people wish to enroll as students or enlist as soldiers, in accordance with the conditions, then naturally they may do so. After they have been found jobs in small collectives, or started themselves up in individual labor, it is no longer necessary for them to wait to be recruited for work in a unit owned by the whole people or in a large collective, or for them to be reassigned to other employment. In fact, "the three things which must not be prevented," and "the preservation of the three rights of recruitment," do not admit that starting work in small collectives is employment. Third, the position in society of the small collective economy and the individual economy is low, and has no economic guarantee. The state has not given a systematic guarantee to the organizing, by people waiting to be assigned work, of various kinds of cooperative groups, cooperatives, and the supply of goods and materials under the individual economy, which will lead to it becoming impossible to keep up production, to sluggish business, to wages and material benefits becoming difficult to guarantee, to the people involved in this kind of business not being able to work without worries, and considering looking for employment in state-run units, and finally to the collapse of this kind of business. The case of the Bianmin restaurant, in the Chongwen quarter of Beijing, which has gained quite a reputation, is representative of this. This small restaurant opened in April 1979, run by 7 young people; from the first, high levels attached much importance to it, it was supported by the leadership, and was supplied with wholesale goods and materials; its daily level of business reached 180 yuan, and many Chinese and foreign journalists covered it in their reports. Later, when the high point had passed, and the leadership no longer attached importance to it, the supply of goods and materials were no longer guaranteed, trade became slack, with daily sales of only 7 yuan. The business could no longer be continued, and the partnership had to be broken up. The people involved said, "a small collective is like a ricebowl made of paper--you can't rely on it." Before National Day 1979, 18,000 young people in this area had found jobs in various small collectives, but by January 1980, more than 4,000 of these had returned home for all kinds of reasons, and were once again "waiting to be assigned work."

The confusion over the concept of employment, as well as some shortcomings and problems in our systems and in our work, has brought us to the point where redoubled efforts in the provision of employment are yielding only very poor results, where small collectives cannot be consolidated, and where work assignment often has to be repeated, and it has also added to the difficulties of solving the unemployment problem. If we are to find an effective solution to the unemployment problem, the confusion over the concept of employment must be cleared up. It must be made clear that employment means not only going to work in a state-run enterprise or a large collective enterprise, but that it can also mean working in a small collective, or individual labor; the position of the small collective economy and of the individual economy in politics, economics, and in the public opinion must also be raised, for only then will the full potential of these economies be brought to bear in the work of providing employment for labor.

4. The Policy of Employing Labor Through Overall Mass Allocation Must Be Changed

This policy has been in force for more than 20 years, and it is now time to weigh up its advantages and disadvantages.

In the past, we have said that, according to the socialist principle of the elimination of unemployment, China is a socialist country, and should not have unemployment. This was a misconception. It is true that we have established the dictatorship of the proletariat, and that China is now a socialist country, but our socialism is still at a not very advanced stage, and to demand the elimination of unemployment at this time is excessively leftist. Nevertheless, this is exactly what we did, under the previous leadership of the "left" deviationist ideology. We first of all gradually found employment for the unemployed bequeathed to us by the old society, and the absorbed the university graduates and technical secondary school graduates. By the time of the "Great Cultural Revolution," we were lumping together all senior- and junior-middle school graduates for unified assignment of jobs. We previously thought that it was in the superior nature of socialism that capitalist societies should have unemployment while we were free from it. At the time, this attitude had real attractions, but in the end the splendid illusion crumbled in the face of harsh reality. We should come to the sober realization that, because the level of the forces of production in our society is still very low, the policy of overall mass allocation of employment can only force us into a state of passivity, where we wish to do everything in a comprehensive way but are simply unable to do so.

As well as rendering the state passive, the policy of overall mass allocation of employment also has other disadvantages. First of all, it forces a great number of people waiting to be assigned employment to rely on the state for the allocation of jobs, making it impossible to bring into play their own initiative, enthusiasm or creativity. The solution of the unemployment problem is the responsibility of the state and of society, but it is also the responsibility of each individual awaiting job allocation. A young person is raised to adulthood with the support of the state and of his family, and so, when he has completed his education and enters society, he ought to learn a skill and set himself up in a profession for the benefit of society, and use his own intelligence and talents to the fullest extent, in order to find a livelihood for himself. Notwithstanding this, our state continues to take care of young people just as a nurse looks after a child, and will even look after them until they die, not allowing them to find professions for themselves, but only to accept the job assigned to them. This has cultivated a sort of dependency mentality among young people, so that they believe it to be the state's obligation to provide employment for them, and not only that, but that the state should assign them to the ideal job, and that they may refuse to take a job which is less than the ideal. Thus, the state's burden of responsibility has been made heavier, and the aspirations of youth are eroded. Under the system of unified state allocation, several million people have to be dealt with every year, which makes for a heavy workload, and makes it difficult to insure the appropriate allocation of jobs. Basically, it is not feasible for the abilities and interests of every individual to be considered, and so some areas have adopted the methods known as "wholesale allocation," [padui 2091 1018] or "dividing up the work and assigning part of it to each individual. As a result, the abilities of young people are not put to full use.

Second, the implementation of overall mass allocation of employment results in a lowering of quality among the rank and file of staff and workers. Each year in China the people who must be found work number in the millions; how can the state accommodate this huge army of people waiting to be assigned to jobs? On the one hand, the number of new positions which can be provided by the state is limited; on the other hand, the total amount of funds available to the state for raising of wages is also limited. Under these restrictive conditions, the greater part of the labor force has joined already existing state-run enterprises and large collective enterprises. These units were in fact already overstaffed, with 5 men doing the work of 3 and now, with the further addition of a large number of staff, 7 men are doing the work of 3, with the inevitable result that such bad habits as laziness, a lackadaiscal attitude, an unwillingness to shoulder responsibility, and drifting aimlessly along from day to day have been engendered among workers and cadres, thus lowering the quality of the rank and file of workers.

Third, productivity has been sacrificed while implementing the policy of overall mass work assignment. Attempting to further increase manning levels in cases where 5 or even 7 men are already doing the work of 3 leads to serious overstaffing, inability to realize labor quotas, and a drastic reduction in labor productivity. This is a matter which merits serious attention. We should not forget Lenin's famous statement, that, in the final analysis, labor productivity is the most important guarantee of the victory of the new social system over the old. In order to make full use of China's great advantage in having a large population, we should of course develop labor-intensive enterprises, but the aim of these labor-intensive enterprise is not simply to avoid a drop in productivity, but positively increase it. China's present productivity is low even among the undeveloped countries, and, if we do not now give our total attention to this situation and display great resolution in altering it, then we will not be capable of realizing the four modernizations and building socialism.

To summarize what has been said above, the policy of overall mass assignment of employment, as well as the corresponding highly concentrated overall management system, is clearly no longer capable of adapting to the circumstances of China's productive forces; it is slowly but surely strangling employment channels, and must be reformed and replaced by a policy in which the provision of employment through the labor departments, employment in voluntary organizations and finding a job for oneself are all integrated under the overall planning and guidance of the state.

5. The Further Implementation of the "Two Choices"

Under the guidance of the new and relatively flexible employment policy described above, we envisage that it will be possible to implement even further the method of the "two choices," in recruitment procedures of state institutions and of urban enterprises and undertakings.

What are these "two choices"? To put it simply, they are the choice of the right man for the job by the unit requiring personnel, and the worker's choice of the right employment.

Since 1979, under the experimental rules and regulations for expanding enterprises decisionmaking power, enterprises may select the best man for the job when recruiting staff and workers, but under the policy and system of organization of overall mass allocation of employment, this type of selection in fact was not, and could not be, put into practice. There is a strong concensus of opinion among units at the grassroots level that, if the overall mass allocation policy is not altered, the selection of the best man for the job by enterprises will just be so many empty words. There are many advantages to changing the policy of unified allocation of work, and allowing units with personnel requirements to select the best workers and staff for the jobs to be done. These are primarily to be found in the best utilization of human talents and abilities, the improvement of economic results, and the raising of productivity. If units requiring personnel give public notice of selection of applicants, and publish in advance the special features of the posts for which recruits are being sought and the conditions of employment then suitable candidates can apply for interviews. Prospective employers and candidates will then both have ample leeway in their choices. Both parties are benefited, since workers are allowed to make full use of their special skills, while the units obtain the workers they require.

In connection with the selection of the best man for the job by units requiring personnel, all units should be permitted to dismiss unsuitable workers and staff, and to reduce overstaffing. No social discrimination should be attached to workers and staff who have been dismissed or made redundant; they should rather be treated with the utmost solicitude by society. Society should arrange for them to receive professional training, and help them to find new employment; their living expenses may be paid by their original units for a certain period, and those who still have no new job after that period has expired may receive social security benefits.

If we are to put into practice the method of units with personnel requirements choosing the best person for the job, then we should strictly abolish the system whereby sons and daughters take over their parents' jobs when they retire. At present, this system is still in force, and it has many disadvantages. The practice among some workers, including technicians and skilled workers, of retiring early so that their children can take over their jobs has led to a widespread reduction of technical and professional levels among rank and file of workers. These workers always seem to allow the least highly skilled of their sons and daughters to take over from them, with the result that the replacement system has turned into a matter of "choosing the worst man for the job." There are also some people who take advantage of this kind of replacement to break the law and make a mockery of discipline. To summarize, if we want to put an end to all these corrupt practices, the replacement system must be abolished. In future, whenever a child of any worker starts work, he or she must undergo rigorous examinations to insure that his or her performance will be up to standard.

The choice of employment by workers means permitting workers, in whatever industry or enterprise, to select a post which allows him to make the best use of his own special skills and talents; it represents the point of departure for the alteration by the socialist countries of the old distribution of labor where workers are set in a certain job for their entire working lives, and it is also an extremely efficacious means of bringing into play workers' special skills, of fully arousing the enthusiasm of the workers, and of promoting the realization of the four modernizations. As stated above, the system of unified allocation of work, which we have been using for all this time, is incapable of encouraging the speical talents and interests of individual workers and, when one has been assigned to a particular job, the system provides very few opportunities for change. Some comrades compare this kind of labor organization to "Magistrate Qiae's arbitrary pairing-off of people to get married," and say that it is grossly inappropriate for bringing into play workers' talents.

The vast majority of the people in China who need to be found employment are young persons around 20-years-old who have graduated from all kinds of schools and colleges. They are right in the middle of growing up; their interests change easily, the talents which they possess are not readily apparent, and some people are not always completely aware of where their own talents lie. Since this is the case, it is often not possible for these young people to make such a permanent decision on the choice of a career; they need to make several choices before they find a position which will really allow them to use their own talents and abilities to the fullest. If they are allowed to choose a career, then if the work is really not suitable they can give up that profession and find other employment. If things are done in this way, some people will find a job which will suit them for the rest of their lives, while others will need to "pick and choose" a few times before finding a suitable post, but, as soon as they are employed in a suitable position, their intelligence and skill will be able to reach their full effect in the service of the construction of the socialist motherland.

If the "two choices" policy is put into effect, the phenomenon of the mobility of labor will necessarily make its appearance. There is nothing to be feared in this. In other socialist countries, such as Romania and Yugoslavia, the labor forces all have mobility. The mobility of labor constitutes a regular pattern which is unavoidable under the circumstances of the rapid development of modern science and technology. The advance of science and technology has increased the rate at which knowledge rapidly becomes obsolete, and things with which we are already familiar lose their usefulness, so that we must study anew; the development of science and technology mean an increase in the rate at which equipment is replaced and, if there are structural increases, then a section of the labor force will necessarily drift away. Under these two conditions, workers must receive new vocational training, and be employed in other industries, and this has only advantages, and no disadvantages, for the development of the national economy. So as to control the large-scale influx of labor from rural to urban areas, the flow can be limited to within and between towns and cities; that is to say, restricted mobility may be put into effect. If things are done in this way, there may be a little confusion at the outset, and many people may want to change their jobs, but basically, when the exchanges have taken place, things will become more stable again, and afterwards, when newly employed persons are allowed to choose their professions, there will no longer be any chaos. In order to reduce the amount of disruption, we can adopt certain measures, so workers' adjustments of their places of work can be carried out in a step-by-step way, and gradually bring the "two choices" to realization.

Some comrades are worried that permitting the mobility of labor may lead to instability of labor forces within enterprises, and that it may effect the raising of workers' proficiency levels and technological levels. I believe that this problem can be resolved through the method of introducing subsidies for long service in factories. This means using economic methods to insure that workers remain in the same job over a long period, instead of using the kind of administrative orders in effect at present. The popularization of the system of work contracts is a measure which must be adopted in order to put into effect the "two choices." On a voluntary basis, workers and units requiring personnel draw up work contacts, which may be renewed at the appropriate time or, if either party does not wish to renew the contract, both sides are free to make a new choice.

By putting into practice the "two choices," workers will subsequently and vigorously come to grips with cultural, scientific and technical knowledge, to gain professional proficiency, to enhance their practical skills, and to consolidate what they are already skilled in; the enthusiasm of the workers can be fully aroused, and the ideology of serving the people and of making contributions with one's talents and abilities to socialism can be cultivated. To sum up, the implementation of this method is sure to be highly beneficial for the rapid advancement of the task of socialist construction.

6. The Reform of the Economic Structure and System Should Be of Benefit to the Employment of Labor

The unemployment problem is an important link in the total social economic system, and is not an isolated problem concerning only individuals. The solution of this problem, apart from directly requiring a correct employment policy and a complete system of powerful measures, also demands the coordinated reform of the economic structure and the system of economic organization.

For a fairly long time to come, with the aim of solving the unemployment problem, aside from the ability of the state-run industries and enterprises to absorb the amount of labor they require, it will be very important to write articles on the economy of cooperatives which take responsibility for their own profit and loss, and on the individual economy, and also on our policies to encourage the voluntary organizing of employment by the masses and individuals finding their own jobs, as well as supporting the development of the small collective economy and giving appropriate encouragement to the development of individual economy. That is to say that nonsocialist economies will be permitted to exist, under circumstances where the socialist economy holds a position of absolute dominance, to act as a helping hand and as a supplement to the socialist economy. This kind of social economic structure will be determined by the conditions of development of the productive forces in China's present stage. The many different levels of development of the productive forces will require the adaptation of many kinds of production relations. The socialist state-run economy will be adapted to large-scale production with relatively advanced technology and a fairly high degree of socialization; the collectively owned economy will be the one which is adapted to forces of production with a relatively low technological level, while small collectives and individual undertakings will be adapted to departments and businesses where the tools of production are backward, and which carry out mainly manual operations. Small collective cooperatives, small cooperative groups, and the individual economy possess widely ranging networks, and have the special feature of carrying out their operations in a vigorous way; thus their growth is advantageous for the increasing of production and for facilitating the lives of the people, and they are also of great value in that they absorb large amounts of labor, solving the problem of employment.

How the economic system currently in force can be reformed so as to make it beneficial for the employment of labor, is another big problem which needs to be resolved. In the development of the economy of cooperatives which are responsible for their own profits and losses, and of the individual economy, the first obstacle encountered is the lack of funds. A proportion of the funds required by the small economies can be raised by the organizations themselves, but whether the remainder can be secured through the support of the national banks in the form of credits, or whether state-run enterprises can be mobilized to invest their own funds or to conduct joint undertakings, these are questions which involve the state financial system and the professional scope of the banks, which need to be examined and tested. The second problem encountered is that of goods and materials. Once the small economies have begun to develop in a big way, simply to rely on the leftover and surplus materials of state-run enterprises will never solve the problem of the means of production. The question of whether or not to start up a market in the means of production involves the reform of the system of organization of management of goods and materials. In the third place, as far as marketing and prices are concerned, it is uncertain whether it will be possible to adopt vigorous policies, whether it will be possible for the small economies to do their own marketing, or entrust it to state-run stores; nor is it clear whether prices will be allowed to float somewhat, according to market conditions. Fourth, in respect of taxation, there should be a change in the method of applying to collectives and to the individual economy the high rates of taxation used in the case of joint state- and privately-owned enterprises; in cases of newly formed collectives and individual economies, taxes may be reduced or waived altogether, according to stipulations, but only where they are essential to the people's livelihood. After the implementation of the above measures, the state will be able to regulate the growth of these economies by means of such economic mechanisms as credit, interest, prices and tax rates, to eliminate or reduce their indiscriminate nature. To this end, the state can consider guiding the economic activities of small collectives and the individual economy through specialized economic structures, by means of regular investigations of social production and of living requirements, and checking and analyzing market conditions, as well as through the constant scientific forecasting of the trends of economic development.

The unemployment problem involves all sorts and conditions of men, and the attention of the whole country is focused upon it. For a number of years to some, the solution of the unemployment problem will be a highly significant and arduous duty, but as long as we emancipate our thinking, liberalize our policies, and allow the initiative and creativity of the masses to play their full part, the gateway to employment will be opened wider and wider.

NATIONAL POLICY AND ISSUES

'JINGJI YANJIU' DISCUSSES SOCIALIST COMMODITY PRODUCTION

HK060716 Beijing JINGJI YANJIU in Chinese No 10, 20 Oct 80 pp 43-47

[Article by He Wei [0149 0251], department of economics, China People's University: "A Tentative Discussion of the Stages of Commodity Development in a Socialist Society"]

[Text] To find out what stage China's socialism has reached is of great significance for accelerating the four modernizations. During the democratic revolution, our people paid an extremely high price to find out what stage the revolution was at that time in order to set a correct general line for the party and direct the revolution to victory. After 1958, not having a clear idea about what stage our socialism has reached, we blindly wanted to "make the transition to communism." In so doing, we wrecked the social productive forces and the socialist system, and the tremendous consequences are known far and wide. To avoid committing the same errors again, we must earnestly learn how to correctly differentiate the stages in the entire development of socialism.

In recent years there have been many articles discussing what stage our society has reached. Some of them maintain that at present our nation is still at the transitional period from capitalism to socialism; some say that it is the stage of underdeveloped socialism, which will proceed to developed socialism; while others combine the stage of underdeveloped socialism with the transitional period and say that it is a stage within the latter; and so on and so forth. In my opinion, these remarks are neither clear-cut nor concrete in differentiating the various stages. To say that we are in a transitional period is misleading, for there is already an earlier transitional period from private to public ownership. Moreover, the transition from socialism to communism, and the whole socialist epoch, can also be called a "transitional period." So-called "underdeveloped socialism" and "developed socialism" describe more vividly our present situation of socialism, yet both terms, lacking a clear indication and stipulated quality, only raise an antithesis. Therefore some people claim that so-called "developed socialism" is actually socialism as envisaged by Marx and Engels. This shows that the term "developed socialism" needs elaboration.

Free competition and monopoly indicate the different stages in the development of capitalism; whereas the replacement of private by public ownership indicates the transitional period from capitalism to socialism. These indications have two points in common: 1) they fall into economic categories that are specific and allow no other explanations; 2) they embody the characteristics of production relations of the stage in question, showing different stages in simultaneous social development. Bearing these principles in mind, I think that after socialist production relations have been established and before advanced-stage communism emerges, the entire period of socialism can be divided into two major stages: commodity socialism and product socialism. Commodity socialism means elementary socialism, an inevitable stage in socialist construction in economically backward countries. Product socialism means advanced socialism, that is, the socialism envisaged by Marx in the "Critique of the Gotha Programme" and by Lenin in this "Nation and Revolution" Since the appearance of Stalin's "Economic Problems of Socialism in the USSR," the advanced socialism envisaged by Marx and Lenin has been missed out in all political economics (the part concerning socialism). It has been maintained that commodity socialism can proceed directly to advanced communism. It seems that advanced socialism does not exist. In my opinion, this stage should be restored to coincide with the scientific assumption of Marx and Lenin.

That socialism has to go through a stage of commodity production development was not predicted by Marx and Engels. This is connected to what they said then, that "the communist revolution will therefore be no merely national one; it will be a revolution taking place simultaneously in all civilised countries, that is, at least in England, America, France and Germany." (Engels: "Selected Works of Marx and Engels," "Principles of Communism," vol 1, p 221) To them, the development of large-scale industries and formation of world market link the "civilised countries" close together, so that affairs in one country will have effects on those in another. When the proletariat revolt in one country, their counterparts in other countries will follow suit. Meanwhile, the capitalist class in these countries will jointly suppress the revolts. Therefore, socialist revoltuion must simultaneously take place in at least several "civilised countries' in order that the proletariat win. When the proletariat of these countries have seized power, "once society owns the means of production, commodity production will be eliminated and the rule of products over producer will also vanish. Anarchistic conditions within social production will be replaced by planned and conscious organising." (Engels: "Selected Works of Marx and Engles," "Anti-Duhring," vol 3, p 323) When different forms of ownership and commodity production cease to exist, and when planned direct product production and distribution is practised, individual labor will turn directly into social labor without any form of value. Marx clearly pointed our that "in a collective society where common ownership of the means of production is the foundation, producers do not exchange their own products. Here, the labor consumed in product production is not expressed in the form of the value of the products, nor the kind of material they are, for now, contrary to capitalist society, individual labor no longer passes along winding paths, but exists directly as constituents of overall labor." (Marx: "Selected Works of Marx and Engels," "Critique of the Gotha Programme," vol 3, p 10) According to Marx's statements, the basic economic features of his socialism are: 1) society owns all means of production; 2) products replace commodities; 3) planned production for the whole society replaces the anarchistic situation; 4) individual labor directly becomes social labor. Meanwhile, apart from implementing "distribution according to work" with labor certificates, Lenin also thinks that although class does not exist at this stage, the nation's role to protect "the rights of the capitalist class" should continue. These features are not related in any way to commodity, some are even contrary to it. This stage of non-commodity socialism has not arrived yet.

Towards the end of the 19th century, capitalism entered the stage of imperialism. Under new historical conditions, Lenin arrived at the conclusion that socialism would first be victorious in one country. Under the guidance of this theory, Russia first won victory in the October Revolution, with the proletariat seizing power. While the means of production became state-owned, Lenin intended to implement the socialist principles expounded by Marx and Engels, but it was a mistake to do so. Lenin says that "we expected--or perhaps it would be truer to say that we presumed without having given it adequate consideration--to be able to organize the state production and the state distribution of products on communist lines in a small peasant country directly as ordered by the proletarian state. Experience has proved that we were wrong." (Lenin: "Selected Works," "Fourth Anniversary of the October Revolution," vol 4, p 571) The error lies in confusing the different stages of socialism and trying to replace commodity production and exchange with direct product production and distribution. Consequently, the Soviet system faced a crisis and the worker-peasant alliance the danger of a breakup; a new economic policy had to be practised in which trade was allowed and became a central link in entire work. As Lenin said, "At the present time, in the sphere of activity with which we are dealing, this link is the revival of home trade under proper state regulation (direction). Trade is the 'link' in the historical chain of events, in the transitional forms of our socialist construction in 1921-22, which we, the proletarian government, we the ruling communist party, 'must grasp with all our might.' If we 'grasp' this link firmly enough now we shall certainly control the whole chain in the very near future. If we do not, we shall not control the whole chain, we shall not create the foundation for socialist social and economic relations." (Lenin: "Selected Works," "The Importance of Gold Now and After the Complete Victory of Socialism," vol 4, p 578) To Lenin, commodity alone is the "only possible economic link between the scores of millions of small farmers and large-scale industry." (Ibid., p 579) This shows that Lenin did not stick to Marxism as a rigid, written theory; he applied and developed it according to the actual situation. As he said, "Communism and trade?! It sounds strange. The two seem to be unconnected, incongruous, poles apart. But if we study it from the point of view of economics, we shall find that the one is no more remote from the other than communism is from small-peasant, patriarchal farming." (Ibid., p 578) Practise proves that Lenin was correct. Vigorous trade enabled the economy to recover and develop and the worker-peasant alliance to consolidate its foundation, so that the first socialist country survived her difficulties.

Russia's experience during her transitional period revealed the necessity of commodity production at that time. It was richer and more concrete than the transitional period discussed by Marx and Engels. However, what has not been thoroughly resolved either in theory or in practise is whether commodity production still exists when the transitional period has ended and socialist production relations have been established.

In his "Economic Problems of Socialism in the USSR," Stalin affirmed the necessity of commodity production in a socialist society and the still important effects of the law of value. Thus Stalin further developed Marxist-Leninist political economy. However, Stalin's discussion was not thorough and at time self-contradictory due to mixing up commodity socialism with product socialism and guiding and administering commodity socialist economy with theories of product socialism. As a result, the national economy developed slowly along a long and winding path and the superiority of the socialist system was not brought into full play.

In fact, as Lenin further developed Marxist scientific socialism, political economy should have developed at a similar pace, so that the two could have been in accord. Lenin's theory of socialist victory in one country often materializes in economically backward countries. One of the basic reasons for the backward economy of these countries lies in their undeveloped commodity production. When the proletariat have won the revolution, their first task is to develop the productive forces. It has been proved by practice in socialist construction that this can be done only by keeping commodity production and exchange. The development of commodity production marks the development of social prodcutive forces. Meanwhile, the development of commodity production promotes division of labor in society, which in turn strengthens cooperation, fosters the socialization of production, sets a material foundation for the socialist system and enables public ownership to develop in large-scale production. Hence only through the stage of commodity socialism can these countries reach the stage of product socialism envisaged by Marx and Engels. To distinguish these stages in theory is a task in political economy. Only this distinction and correspond in theory with Marx's scientific prediction and in practice with Lenin's theory of socialist victory in one country, so that theory is united with practise.

Actual conditions reveal the main features of commodity socialism as thus: first, each enterprise is a relatively independent commodity producer, which has autonomous economic management within the scope of the nation's plan, guidance and policy; second, each enterprise produces commodities which the nation cannot allot, and the law of value has a regulatory function in the fields of production and circulation; third, allowing prices to float freely within a certain scope (according to Samuelson, a well-known American economists, "there has never been a pure, 100 percent self-regulatory enterprise system, although Britain in the Victorian era came close to it. In the present system, the government plays an important role in the application of the price regulation system." (From "Economics" vol 1, Commerical Press 1979 Edition, p 27) Socialist countries certainly interfere much more in pricing than capitalist countries do, and so a pricing system and policy is formed.) And protecting justified competition so as to encourage progress and eliminate backward enterprises step by step; four, each enterprise is an independent accounting unit that assumes sole responsibility for its profits and losses, it covers its expenses with its own incomes, pays taxes and differential income to the state, pays wages to its staff according to its income and staff labor, and allows a certain degree of floating while guaranteeing basic incomes. Apart from the above expenses, the enterprise must have surplus for reproduction and staff welfare. Only in this way can the enterprise become a relatively independent commodity producer and its incentive and initiative be brought into play.

However, in our socialist economic management in the past, the two stages were confused. Commodity socialist economy was administered with the principles of product socialism. Conflict appeared both in theory and in practice. The separation of theory from practise was chiefly reflected in the blind pursuit for an ownership that was the bigger and the more public the better, and in another blind pursuit for a highly centralized instructive plan to include supply, production, marketing, manpower and capital in the national plan, so that an enterprise could not act on its own and was completely fettered. All this was contradictory to the demands of commodity production. In theory ownership by the whole people and highly centralized plans mark the superiority of the socialist system. We said ownership by the whole people was the economic basis for planning and management, but we totally ignored the restriction of socialization of production on planning. Whenever we had to "strengthen the plan," the central authorities would immediately have the say over the administration of an enterprise. To promote collective ownership economy, we carried out programs like "transition in a state of poverty" in villages and "upgrading" and "merger of factories" in the cities. We discouraged household sideline production and private plots in much the same way as we cut "the capitalist tail." Ignoring the degree of socialization of productive forces, insisting on adopting the above measures, including all production and circulation in a unified national plan, and administering the economy with the principles of direct product production and distribution--these measures violated objective economic laws and encountered all kinds of insurmountable obstructions in reality. Since we neither understood nor recognized economic laws, we could only rely on administrative means to mix nonsocialization with different forms of ownership together by force, and carry out unified plans to replace commodity production and circulation. This was indeed feudal separatist rule in the absence of feudalism and guild administration in the absence of a guild system, both of which retarded the development of commodity economy. It was so-called "rules and regulations" in management. Under these conditions, such phenomena as bureaucracy, subjectivism, wrong orders, low efficiency, poor economic results and appalling waste were bound to occur. All this was due to the confusion of the two stages: commodity socialism and product socialism. From now on we should confirm that the present stage is one of commodity socialism. In making long-term plans, we should take developing commodity production as the central task. What does not meet the demands of the development of commodity production should be regulated and reformed.

There is a clear distinction between commodity socialism and capitalism. Here we practise public ownership of the means of production and distribution according to work: the scope of commodity is narrowed down, the means of production cannot be sold to the individual, the capitalist is absent from commodity exchange, and the aim of production is to satisfy people's material and cultural needs. As the overall economic development is in tune with the plans and policy formed by the state according to economic laws, it can avoid chaos and economic crisis. The above account explains the intrinsic economic differences between commodity socialism and capitalism. The two must not be confused.

Commodity socialism and product socialism have many points in common: in both of them the means of production is publicly owned and distribution according to work is practised. All economic laws of socialism are effective in both stages. Due to some differences in economic conditions and the level of productive forces, the economic laws have different effects in various fields. Take public ownership as an example, in product socialism it is all-society public ownership, whereas in commodity socialism it is otherwise. In both stages, distribution according to work refers to the distribution of individual consumer goods, but in commodity production this is done through commodities and currency, whereas in product socialism it is done through labor certificates. The basic economic laws are effective in both stages, but in product socialism, society's aim of production is realized directly through the use value of products, whereas in commodity socialism it is through "commodity as equivalent to use value" and "uniform value." If either one of the two commodity factors is not realized, the whole commodity exchange cannot take place either, and eventually the socialist aim of production cannot materialize.

so the two are united. The old theory that the aim of socialist production is equivalent to use value and that only the aim of capitalist production is value is now not totally correct. It is right to say that the aim of socialist production is not for surplus value. Yet in the situation where commodity production exists, it is not theoretically justified to say that use value alone is the aim of social production. Commodity itself is value and use value combined. Measures like one-sided pursuit of quantity of products and not budgeting for production costs and economic effects are unrealistic. In agriculture, our attempt to "get tons of output from fields" only resulted in poverty-stricken production teams with high production; in industry "tonnage-ism" caused enormous accumulation and waste. Both were disastrous effects resulting from negligence of value and the concept that the aim of socialist production is use value alone. This is an inevitable outcome when the two stages of socialism are mixed. In this way, the method to implement the aim of product socialism was wrongly applied to commodity socialism, and so what was done was not in tune with actual economic conditions.

In commodity socialism, the entire national economy is planned, but this plan cannot work without value law, and it is not carried out directly as in product socialism. Direct planning in product socialism is antithetical to value law, and planning in commodity socialism is done through conscious application of the value law. Some people regard planning and value law as antithetical. This is because the negate the difference in carrying out plans in commodity socialism and product socialism. They also negate value law and planning in commodity socialism with planning in product socialism. One feature of economic planning in commodity socialism is utilizing value law in a planned way. Under capitalist private ownership, value law has two effects: on one hand it spontaneously regulates the balance of social production, and on the other it causes competition and anarchistic production. In the past discussions on the effects of value law under socialist conditions, the regulatory function was totally refuted. Now we should give full play to value in this aspect, and overcome the resulting imbalance. Why can't we apply value law in the same way as we do water and electricty, adopting its merits and avoiding its harms? Under socialist conditions, we can certainly make conscious use of value law and leap from the realm of necessity to that of freedom. For this we should do well at least in the following three tasks: first, the state should make long-term plans, forecast economic development, publicize control figures and provide economic information in order to guide and influence enterprise production; second, through concrete measures, the state should regulate social production and circulation with such economic levers as pricing, taxation, bank loans, interests and wages, so that enterprises, in considering their immediate economic benefits, will obey the demands of state plans; third, through economic legislation, we should use compulsory means to force enterprises to follow state plans. In this way, we can basically overcome anarchism in social production and develop national economy in a planned way. One feature of economic planning in commodity socialism is conscious application of value law; that of product socialism is direct planning. At present some capitalist countries are making plans to interfere with their economy by means of pricing, interest, taxation and wages. Is this similar to our planning for commodity socialism? The answer is no, for in capitalism there exist various financial groups which control the making and implementation of economic policies. As a result, the capitalist case is limited in scope and planned development for the whole social production is impossible.

In socialist construction in economically backward countries, only through commodity socialism can we reach product socialism, and only then will commodities vanish. The conditions for socialist product production are different from those for public ownership and division of labor in society. The development of product production will lead division of labor in society to specialization. Specialization will provide conditions for automation in production. The latter demands a higher level in science and culture from the operator. With the old society's gaps in labor division drastically narrowed down and labor time shortened, conditions for overall development for mankind will be created. The development of division of labor in society will bring the departments and enterprises to closer interdependence and inter-restriction. Especially with automation, different forms of public ownership will make the transition to ownership by society, and the development of production relations will adjust to the socialization of production procedures. With the development of production relations, some commodities will gradually withdraw from the stage of history and will even be replaced by products. This will be the coming of the socialism envisaged by Marx and Engels, that is product socialism.

'JINGJI YANJIU': ISSUES OF PUBLIC OWNERSHIP UNDER SOCIALISM

HK070734 Beijing JINGJI YANJIU in Chinese No 10, 20 Oct 80 pp 48-52

[Article by Mei Xingbao [2734 5281 0202], student of agricultural economy, 1978 the Chinese People's College: "Discussion of Marx's and Engel's Conception of Public Ownership Under Socialism"]

[Text] In this era, public ownership under socialism is not only a matter of basic theory but also an important practice in China. The work being undertaken in our country to restructure the ownership system is in fact a demand made by the productive forces of the present stage on the relations of production. But some people held that the restructuring work is against Marxist theory about socialist public ownership and they even regard it as "a big step backward." Consequently, some regions and units are not clear as how to carry out readjustment work and they are at a loss how to do it. Now the question is: is the public ownership we have formed in line with the socialist public ownership that was assumed by Marx and Engels? And what is the difference between our soicalist public ownership and the one they imagined? What is the structure of the ownership that we should have today? It is very important to make these questions clear to guide our practice of the economic restructuring and in developing our national economy as a whole.

I

The socialist public ownership assumed by Marx and Engels was based on the supposition that socialist revolution must simultaneously succeed in several or all advanced capitalist countries. And with capitalist industrialization, the social productive force of these countries will develop to a higher level. In addition, the socialist public ownership imagined by Marx and Engles is public ownership under communism. Marx explicitly pointed out: "Scientific socialism will only apply when it is contradictory to utopian socialism." (Marx: "Selected Works of Marx and Engles, "Abstract of 'The State and Anarchy' by Bakunin" vol 2, p 638) In fact they regarded socialism as synonymous with communism, so as to differentiate and compare scientific socialism with utopian socialism. They used different names under different situations just in order to conform to the habit at that time. Therefore, the contents and forms of socialist public ownership or communist public ownership have in general the following features:

First, this public ownership is unitary ownership by the whole society with unitary structure. According to Marx's and Engels' imagination, public ownership in both the lower and higher stages of communism means that the means of production belong to all members of society. Engels said: "There are only two forms of possession of the means of production...either individual possession...or public possession." "Socialist interest does not defend individual possession but will abolish it because public possession is impossible in places where individual possession still exists;" therefore, "it is better to say that the task of socialism is to hand the means of production over to the producers as their public possession." (Engels: "Selected Works of Marx and Engels," "The Problems of Deutsch Farmers" vol 4, pp 302-303) By "public possession" Engels meant possession within the sphere of society. That is to say, all members of the society are the owners of all means of production. Direct combination of laborers and the means of production becomes the basis for the form of social production. This form will also become the social production form in the lower stage of communism.

When the proletariat had just seized political power, Marx and Engels held that the relations of ownership of the means of production would take the form of ownership by the state. They said: "By using their own political power, the proletariat step by step seize all the capital of the bourgeoisie, and concentrate all production tools into the hand of the state that is composed of the ruling class to increase as soon as possible the total capacity of the productive force." (Marx and Engels: "Selected Works of Marx and Engels," "Manifesto of the Communist Party," vol 1, p 272) Experience has proven that following the seizure of power by the proletariat, it is imperative to use the form of ownership by the state, but this form alone is not enough.

In his late years, Marx imagined that in the countries with peasants as the majority or in places where, unlike Britain, the peasants are not replaced by farm laborers, "the proletariat will, on behalf of the government, take measures to directly improve the conditions of the farmers so as to draw them over to the side of the revolution. From the beginning, these measures must promote the transition of private land ownership to collective land ownership so as to enable the peasants to realize this transition through economic way. But measures that would offend them must not be taken. Such measures include abolishing the right of inheritance or ownership by the peasants." (Marx: "Selected Works of Marx and Engels," "Abstract of 'The State and Anarchy' by Bakunin" vol 2, p 635) Engels also pointed out explicitly that "during the whole transitional period to communism, we must undertake large-scale cooperative production as an intermediate link. Marx and I have never been sceptical about it." (Engels" "A Letter to August Bebel, 20-23 January 1886" and "Letters on 'Capital' by Marx and Engels" p 470) In declaring their imagination both Marx and Engels had already expounded the theory about the transitional period. Therefore it can be seen that their imaginative collective ownership only referred to a form of the ownership of the means of production during the transitional period from capitalism to communism in countries with small-scale farming by individual households as the main business. They did not regard this ownership as public ownership under socialism at the end of the transitional period. On the contrary, they held that this ownership would be replaced by state ownership at the end of the transitional period. Therefore, according to their imagination, there is only one form of possession during the first stage of communism, and this form is socialist public ownership. They also regarded the more by the state to possess the means of production as the first but final independent measures. Thus consequantly, following the elimination of the state, ownership by the state will be replaced by ownership by the whole people in the period of higher stage of communism. Thus such a unitary structure of ownership does not totally accord with the reality in our country.

Second, the socialist public ownership assumed by Marx and Engels is regarded as opposite to the capitalist private ownership that emerged as a result of highly developed productivity. Such ownership highly accords with socialized mass production. After the formation of the imaginative socialist public ownership, anarchic social production will be replaced by social and systematic readjustment of production according to the need of society and all its members. Thus, "after that, they will consciously create their own history; after that, the role of social causes motivated by the people will achieve ever-increasing expected results in the main aspects. This situation means that the realm of necessity of mankind leaps into the realm of freedom" (Engels: "Anti-Duhring," People's Publishing House, 1970, p 280) Consequently, the establishment of this type of public ownership will constantly promote the material and technical base of communism, greatly raise people's cultural standard, help form a unified and systematic national economic system and gradually realize modernized production that is carried out in a planned way and that belongs to the whole of society, including urban and rural areas. Members of society in general take part in management, all the laborers are equal in the relations of production and they are all owners of the means of production in the whole of society. Therefore it is necessary and possible under the basis of such productive forces to arrange the means of production in a unified way within the sphere of society. The form of exchange of commodities is no longer necessary. But with one level of productive forces, such situation cannot be realized in our country at the present stage.

Third, the socialist public ownership imagined by Marx and Engels stressed that laborers must directly combine themselves with the means of production. In addition, laborers cannot in other forms (such as representing a private owner of the means of production) take part in social production except through his own labor. This situation constitutes an indispensable part of the entity of the ownership. Engels said that all the means of production of a society "can be possessed and made possible only when the material conditions for such possession is ready," and when production develops into this stage, "the possession of the means of production by a certain particular social class and the political control, educational monopoly and spiritual leadership by this class is not only unnecessary but will become an obstacle to economic, political and spiritual development." (Engels: "Anti-Duhring," the People's Publishing House, 1970, pp 278-279) In short, it is only the labor of the people and nothing else that can supply them. In addition, with the exception of personal means of consumption, there is no personal property. Thus small commodity producers, individuals, laborers and the laborers of the units with collective economy who take part in social production as laborers and at the same time are also the owners of the means of production will not exist under the socialist public ownership imagined by Marx and Engels.

II

It is clear that the public ownership imagined by Marx and Engels differs very much from the public ownership that we have formed both in content and form. In particular, their imaginative public ownership is contradictory in some aspects to the structures of our present public ownership. If we treat the conclusion made by Marx and Engels at that time as dogmatic and use it to measure the ever-developing social phenomena of today, then the contradiction between the theory and practise will never be resolved.

Marx and Engels lived in the era when capitalism was on the upsurge. At that time, free competition had not completely developed into monopoly and various contradictions of capitalist countries had not developed so sharply, while productivity and the relations of production were still developing. Therefore, the conditions for socialist revolution were not mature in the middle and late 19th century. Marx's and Engels' greatest contribution was that they expounded the law of the emergence, development and extermination of capitalism and predicted the historical trend in which capitalism will eventually be replaced by socialism. We can in no way regard every sentence and every imagination of Marx and Engels as a panacea for solving actual problems. With the development of capitalism, many new situations that were beyond the imagination of Marx and Engels have appeared today. These situations, which require new theories to sum up and explain, are even contradictory to their imagination. In particular, out of their imagination, these situations have appeared in socialist society in Eastern countries decades after they passed away.

Therefore it is quite understandable that when Marx and Engels viewed their imagination of socialism, the concept of scientific socialism was only shared by a few workers and intellectuals with consciousness and it was yet to be realized. It was only in the late 19th century and early 20th century that capitalism developed from free competition into monopoly to become imperialism. Under the role of the law of unbalanced development of imperialist politics and economics, the proletariat broke through the weakest point of the front of imperialism and first won socialist revolution in backward countries in Europe and Asia instead of in advanced capitalist industrialized countries in Western Europe and North America. Thus such conditions have determined that the features of socialist public ownership in the present stage in our country differ in content and form from that imagined by Marx and Engels. The standard of our public ownership cannot be as high as imagined by them and it cannot take a single form. Therefore, we must bear in mind that our economy largely consists of small peasant economy with weak foundation. Consequently, the form of our ownership must accord with the situations of our country.

III

Concretely speaking, although Marx's and Engels' imaginative socialist public ownership differs in many aspects from reality in our country, their stand, viewpoints and methods in studying the relations of socialist public ownership still remain a guide for us in studying our public ownership in the present stage.

Marx and Engels persisted in the doctrine that everything has two aspects in investigating the contents and forms of ownership from the angle of law and economy.

They defined from the angle of law that the forms of ownership belong to the relations of will. What is more important, they defined the forms of ownership from the angle of the relations of economy. They pointed out: "In private law, the existing ownership is the result of general will." (Marx and Engels: "Selected Works of Marx and Engels," "Ludwig Andrias Feuerbach," vol 1 pp70-71, 74-75) But "to investigate things merely from the angle of relations of will, they are not things. When these things are independent of the right (a relation which is termed as concept by philosophers) during exchanges, they then become things. That is to say, they are real property. Be defining the right as legal imagination, then when the relations of ownership further develop, it will result in such situations in which some people will enjoy legally the right of possessing some things but in fact they do not possess them. For example, because of competition, some pieces of land are no longer available for leasing. But legally, the owner of these lands still has the right to possess, use and even indiscriminately use these lands. Such right is in fact useless to him. As the owner of the lands, he has nothing provded that he has enough capital to operate the lands." (Marx and Engels: "Selected Works of Marx and Engels, "Ludwig Andreas Feuerbach" vol 1, pp 70-71, 74-75) Such an explicit explanation shows that the forms of economic relations are in fact the nature of ownership. To possess is not for the sake of possession itself but for realizing certain economic interests.

Marx and Engels also persisted in investigating the relations of ownership from the angle of its development. They held that the possession of the means of production by members of society was caused by different levels of the development of productive forces in different periods. "Such possession is first restricted by the things that are to be possessed. It is also restricted by the total development of the things themselves and by the productive forces that exist only within the sphere of exchanges in general," and at the same time, "such possession is also restriced by the individuals who possess" and "restricted by the forms that are taken for possessing." (Marx and Engels: "Selected Works of Marx and Engels," "Ludwig Andrias Feuerbach" vol 1 pp 70-71, 74-75) That is to say, the relations of public ownership imagined by Marx and Engels eventually show stages of development from immaturity to maturity.

According to the above mentioned viewpoints of dialectic and development and the principle often expounded by Marx and Engels that the relations of production that must accord with productive force, we can decide which relations of ownership are advanced and which are backward. Accordingly, we can also properly sum up the rational structures of our present ownership and the basic features of our public ownership.

Our public ownership has been formed on the basis of a backward, semi-feudal and semi-colonial economy. Under this ownership system, each laborer is an owner of the means of production. But compared with advanced countries, the means of production such as machinery and production tools that are possessed by each laborers are of poor quality, small quantity and low efficiency. Furthermore, these means of production are possessed by various nationalities, regions, departments or by various enterprises of a department and they differ very much from each other. They range from advanced and automatically-controlled equipment of the 1970's to ploughs of the Middle Ages.

The owners themselves have low cultural and technical levels. They cannot choose their job by totally depending on their talent and knowledge, and there exists a big gap between manual laborers and mental laborers. The form of the combination between laborers and the means of production is still characterised by the old social division of labor that generally exists. They can only engage in one professional job for the rest of their life. Material production conditions have become an obstacle for them to display their talent, that eventually cannot fully develop. Labor has become an individual method of livelihood. Thus material incentive is necessary to make use of the talent of laborers. All these are decided by the level of the present productive force which is characterized by low level and many duplications. Hence it is imperative to have ownership with different strcutres. That is to say, our ownership is composed of the economy of public ownership as the main thing and individual economy as a supplement. The economy of public ownership includes various forms of business and various structures of ownership. Thus in order to develop production, different laborers of different economic units possess different means of production and attain different economic results. But in the past, we had only two forms of ownership--ownership by the state and the collective ownership. In such a situation, the possession of the means of production met many restrictions objectively and subjectively. As a result, the possessors could not gain proper economic interest and they were not interested in production. Thus this kind ofstructure of ownership seriously hampered the development of productive force and it must be restructured at once. This includes restructuring and reorganizing the subordinate relations of enterprises. For example, the enterprises that do not have enough materials, that have lost money in successive years and have long been uncompetitive must be resolutely closed down, have their production suspended, be merged or turned to other production. On the other hand, some state enterprises may be turned into collective enterprises with sole responsibility for their own losses or profits. Practice has proven that small state enterprises in many places have made multiple profits after they were turned into collective enterprises. Similar measures must be taken in agriculture according to specific conditions, and relevant policies must be relaxed so that rural economy can further develop. The method of fixing farm output quotas for each household has been introduced in many remote and mountainous regions that have consequently become prosperous. In short, ownership must have different forms of structure and various enterprises must be allowed to develop through competition.

Our economy is mainly composed of the economy of ownership by the state. The enterprises under this ownership must carry out the principle of material interest, pursue economic results and carry out economic accounting. The collective economy remains an important part of the public economy and in general the economic organizations of this economy are small in the size of their business but have enormous labor force. In addition, the laborers of these enterprises are directly combined with the means of production in a smaller field. Therefore such enterprises can more easily attain visible material interest and are most suitable for carrying out manual labor as their main task. Such enterprises must get support from the state so that they will develop more rapidly.

As mentioned above, it is not enough for public ownership at the present stage just to have two forms of structure. In the work of restructuring our economy over the past 1 to 2 years, there has appeared a new form of the collective economy--ownership by joint ventures. This economic ownership differs from the features of both ownership by the state and collective ownership. Such joint ventures are composed of many enterprises with different (they may also be of the same) ownership. Such organizations are set up under the principle of voluntariness and mutual interest to mee the need of objective economic law so as to accord with the need of socialized and specialized production. Joint ventures will help various regions, departments and enterprises display their economic and technical advantages and enable the enterprises to display their advantages, overcome disadvantages and complement each other. Thus on the basis of the existing labor force and materials, these enterprises change the forms of their business and reorganize labor force to attain higher profits than from individual operation, and enable the laborers to achieve more economic interest under the same amount of the means of production. Concretely speaking, ownership by joint ventures is divided into the economy of the enterprises with public ownership, and joint economy of China and foreign countries. The former is composed of the enterprises that broke through the limit of regions, trades and ownership, while the latter is the economy composed of our and that of other countries. As joint ventures are at present mainly undertaken between our country and capitlaists of advanced capitalist countires and regions, therefore this economy can be called state capitalist economy.

In addition to the forms of public ownership mentioned above, there also exists individual economy, which is helpful in enlivening the markets, and complements the economy of public ownership; it will continue to exist for a long time to come. After socialized and specialized production has developed, this individual economy will automatically combine itself with the economy of public ownership. Therefore it is not necessary for the state to take forcible action against such economy.

Practice in economic construction over the past 1 to 2 years has proven that the existence of various forms of the structure of ownership is in line with the level of our productive force. Such relations of ownership have greatly developed productive force and enabled many trades and enterprises to develop very rapidly. So the criterion for judging whether the present structure of the ownership is rational and whether the nature of the public ownership by enterprises is backward is not the subordinate relations, neither is it the degree of public ownership. The only criterion is to see whether the present structure of ownership accords with and promotes the development of productive force and brings more and more material interest to the possessors of the means of production. The work to make the structure of the present ownership flexible and the work of the readjustment of the subordinate relations of the means of production is a move of advance, not retreat. On the contrary, if we disregard both the level of productve force and the economic interest ofthe possessors of the means of production and carry out the so-called revolution in the relations of ownership, such a "revolution" is a step backward historically even if it helps to increase the degree of public ownership and brings about a unitary structure of ownership. Under the slogan of seeking things "large in size and collective in nature," the relations of ownership constantly "made the transition under poor economic conditions" after 1958. Measures were also taken to upgrade ownership, but such measures in fact ran counter to the Marxist principle that the relations of production must be in line with the nature and level of productve force.

The various forms of the present relations of ownership will still be readjusted in future so as to enable them to accord with the development of production. But this readjustment will not follow the past experience of making the transition from small collective to big collective and from collective ownership to ownership by the whole people. At present, it is unsuitable for us to set up many big enterprises with state investment. On the contrary, we must go all out to develop the economy of joint ventures. This economy will eventually unite into many trusts in competition; and these trusts will further promote the union that will gradually develop into a unified economic organization of the whole country and the whole people. Thus a communist society will emerge on the basis of a highly developed social productive force.

ECONOMIC JOURNAL ON STUDYING QUANTITATIVE ECONOMICS

HK180000 Beijing JINGJI YANJIU in Chinese No 10, 20 Oct 80 pp 60-66

[Article by Wu Jiapei [3527 1367 1014] of the Economic Research Institute of the Chinese Academy of Social Sciences: "Questions Concerning the Study of Quantitative Economics"]

[Text] What we call the study of quantitative economics refers to the study of the quantitative expression, relations and changes of the economy, the study of the relevant laws, as well as the study of the requisite tools for analyzing economic quantitites (mainly methods of economic mathematics). Marxist economics always pays great attention to the quantitative study of the economy. In the current construction of socialist modernization, to pose the study of quantitative economics as a problem is of great significance to the development of economic science and to raising the standard of our economic work.

I

The following phenomenon in real life evokes deep thought: on one hand, in economic work people often pursue quantity at the expense of quality, but on the other hand, in economic research people often do qualitative analysis alone without paying attention to quantitative analysis. These two facts appear to be contradictory trends, but actually they are inherently consistent. Quality and quantity constitue a dialectical unity, but at different times or places or under different conditions, the means and effects of a transition from quantitative change to qualitative change or from qualitative change to quantitative change do not remain absolutely unchanged. In actual economic work, when we fulfill a certain quantity, we also need to develop science and technology, raise the standard of management and so on in order to further improve the quality. In theoretical economic research, to conduct quantitative analysis in addition to basic qualitative analysis, we need to acquire adequate information, improve our analytical tools, employ mathematical methods and computation techniques, and so on. When economic development is still at the stage of being principally extensive in nature, people often pay attention to quantity alone because economic development mainly relies on the quantitative expansion of various factors of production. However, when economic development becomes principally intensive, people will focus their main attention on research into quality, because economic development will then rely mainly on raising the quality and utilization ratio of various factors of production. Corresponding to the particular stage of economic development, when studying the process of principally extensive economic development, generally we can master the qualitative characteristics without any particularly complicated quantitative analysis, because it is rather simple to analyze the factors. However, when studying the process of principally intensive economic development, it is very difficult to accomplish the task of ascertaining the quality by relying solely on experience and intuition without conducting in-depth quantitative analysis, because various factors and their interrelationships become increasingly complicated. Therefore, the transition of economic analysis from qualitative analysis to quantitative analysis signifies the deepening of cognition--a leap from a lower stage to a higher stage. (To express the quality of an objective thing as a quantity is an important method and indication of man's deepening of his cognition of objective things. It indicates that scientific knowledge changes from incomplete to complete and from inaccurate to accurate. However, such development of cognition is based not on the divorcement of quality from quantity but on the unity of quality and quantity. Qualitative study cannot be conducted without a definite amount of quantitative observation and analysis, and quantitative analysis must be based on qualitative analysis and it must promote qualitative analysis.) Whether this leap can be accomplished depends on the objective progress of economic development and is also constrained by many other factors.

Over the past 30 years or more, our country has achieved great success in its economic research work. However, judging from the actual research results, applied economics developed less satisfactorily than theoretical economics, quantitative analysis developed less fully than qualitative analysis, and the discussion of methods and methodology was less active than the discussion of general abstract theory. For a long time, we did not pay great attention to the science of economic management, the analysis and study of economic statistical data and the application of mathematical methods in our economy. Published articles very seldom carried figures and formulas. The theoretical conclusions of economic research lacked numerical proof and were therefore not concrete enough to be applicable to actual economic work. Some works contained quantitative analysis and applications of mathematical methods in addition to basic qualitative analysis, but they were often ignored because people thought these articles could not be understood. The causes of these phenomena are manifold. First, Lin Biao and the gang of four treated the quantitative study of economics and application of mathematical methods to economics as heresy, willfully denouncing such study and application as revisionist and bourgeois stuff. Consequently, our country's research in this respect, which had just begun toward the end of the 1950's and the beginning of the 1960's, was ruined. Second, for a long time the problem of integrating theory with practice had not been very satisfactorily solved. Researchers could not obtain the economic data (in particular statistical data) necessary for quantitative analysis. In particular, there was insufficient data for comprehensive analysis. Third, our country's economic research personnel generally had a low standard in mathematics. Many comrades were not accustomed to or were not interested in reading mathematical calculations and deductions. In the teaching of economics, mathematical training was not awarded great attention, and mathematics had not attained its rightful position even in the teaching of statistics. Lastly, in the final analysis, these phenomena are related to such objective realities as the underdevelopment of our country's productive forces, the backwardness of our science and technology and the fact that our national economic development is at the stage of being principally extensive.

Correspondingly, the development of our country's economic science has not attained the level at which mathematical methods and computers are widely used.

After the focal point of the party's work has shifted, in the process of implementing the principle of "readjustment, restructuring, rectification, improvement," and on the road of the new long march toward achieving the four modernizations, it has become increasingly important to alter the backward situation of our economic science and to strengthen the study of problems of national economic development concerning quantitites and methods. The importance is explained below.

First, economic science should serve the four modernizations better. When developing such branches of theoretical economics as political economics and the economics of productive forces, we must also vigorously develop such branches of applied economics as the science of economic management, technological economics, quantitative economics and so on. Then, the theory of economic science will not merely serve as an ideology to arm economic workers, enabling them to work better according to objective economic laws. In addition, by making economic theory more concrete and accurate, and by means of such intermediate links as formulating and testing specific plans and measures as well as providing various methods and technical means, we can directly link economic theory to economic practice, so that economic theory can serve economic practice on a wide scale. When dealing with many major economic problems such as economic systems, economic structures and importing foreign technology, we should carry out detailed quantitative analysis to obtain more accurate quantitative solutions. Such demands on our efforts will become increasingly pressing as the construction of our socialist modernization progresses, and the use of mathematical methods and computers will make it possible to fulfill these demands. Likewise, the study of objective economic laws should not remain at the stage of correct exposition alone. It should further reveal the conditions and mechanisms under which economic laws perform their functions as well as meausre and determine the quantitative limits and the characteristics of such functions, so that people can really use economic laws in organizing and managing social production to improve economic effectiveness.

Second, to improve economic management, most importantly planned management, we must more intensively study problems concerning quantities and methods. In economic management, policymaking and forecasting are indispensable. Correct policymaking cannot involve qualitative analysis alone without quantitative analysis. Policymakers may have been able to rely on their experience to make judgments about past problems or simpler problems and arrive at correct decisions. However, faced with some increasingly complicated, new and major problems in economic development, policymakers often have no practical experience and cannot tackle them indiscreetly for fear of incurring huge losses. Then, they must rely on science and quantitative methods to conduct analyses and comparisons and arrive at better choices and decisions. The gradual transference of a large amount of policymaking power to lower levels and the coordination of many policies also necessitate quantitative testing as well as formulating appropriate methods. Economic forecasting linked to economic policymaking and long term planning, is aimed at discovering the trend of economic development as well as the direction and degree of development of the national economy and its various elements. Therefore, we must pay attention to forecasts that specify quantity and time and to the study of various corresponding methods. Moreover, the strengthening of equilibrium calculations in planned management (in particular the study and analysis of comprehensive equilibrium) and the choice of plans (in particular the formulation and derivation of optimal plans) will also inevitably call for a wide use of mathematical methods. Currently, in addition to the improvement of planning methods, statistical, accounting and business accounting methods must also be promptly improved and perfected.

Third, to modernize economic management, and in particular to efficiently use computers, the means of modern management, we must also correspondingly strengthen the study of quantitative problems and mathematical methods. Of course, modernizing economic management cannot be equated to using computers. However, the appearance and application of computers are an important indicator of the modernization of the means of economic management. The computer promotes the modernization of the economic management system and methods. Computers are indispensable to the modernization of economic management. The information revolution, represented by the computer, enables machines to replace part of man's mental labor and can be said to be another great industrial revolution. The appearance of the computer cannot be described simply as an innovation of computing tools. Deepening quantitative economic analysis as well as studying and formulating methods and models of economic mathematics are the prerequisite for a wider application of computers in economic management. Such a wider application also calls for insuring an adequate and reliable supply of economic information (data and other materials). It is very difficult to organize and manage modern large scale production without scientific economic information, just as without advanced computation techniques. To opportunely obtain accurate and comprehensive economic information, and to transmit, decode, summarize, process, perform calculations on and analyze such information, it is necessary to make extensive use of statistical and mathematical methods in conjunction with a computer network so as to establish a powerful and rational economic information system.

II

The socialist economy is a unity of the productive forces and production relations. Both productive forces and production relations undergo quantitative and qualitative changes. However, quantitative changes predominate prior to any radical qualitative change. Quantitative changes cannot be ignored. The socialist economy is a planned economy based on the public ownership of the means of production. The aim and interests of each enterprise are basically consistent with those of the entire society. This results in more favorable social conditions for quantitative study and the application of mathematical methods compared with capitalism. To develop the study of quantitative economics quickly, we should create conditions in the ways described below.

First, in economic theoretical work, the study of quantity must be integrated with the study of quality.

The objective basis for developing the study of quantitative economics is that any economic phenomenon or process is a unity of its qualitative and quantitative characteristics. Such unity is found not only in economic concepts and categories, but also in economic laws. The conversion of old quality into new quality is accomplished on the basis of quantitative change. The unity of the qualitative and quantitative characteristics of an economic object calls for the synthesis of the two basic methods, qualitative analysis and quantitative analysis, in economic research. Without such synthesis, cognition will be biased and incorrect. In any science, we must take qualitative analysis as the prerequisite and admit its prime significance over quantitative analysis, because without the basis of prior and in-depth qualitative analysis, quantitative changes and the laws concerning them cannot be understood. In economic science, because of the social and historical properties of its objects of study and the greater complexity of their interrelationships compared with objects of nature, qualitative analysis is particularly important. However, it is quite incorrect to underestimate the importance of quantitative analysis, ignore its role in deepening our cognition of quality and deny its great importance to the complete cognition of things. In studying the socialist economy, we tend not to put quantitative analysis in its proper and important place. The organization, management and planning of our socialist economy calls for greater attention to quantitative analysis. Without the corresponding quantitative analysis, qualitative analysis will become empty talk which cannot really solve practical economic problems.

To develop quantitative analysis in socialist economic science, we must formulate and use economic mathematical models. (Such models are formulas or systems of formulas which represent quantitative relations in economics. For example, the following system of equations in the form of a matrix represents the quantitative relationship between the gross social products and the final products: the inverse of (I minus A). Y equals X. This is the economic mathematical model of joint intersectoral equilibrium. In the equation, X is the gross social products vector, whose elements are the output quantitites of the products of various sectors. Y is the final products vector, whose elements are the total national income values of various sectors. A is the direct consumption coefficient matrix, whose elements are the quantities of the direct consumption of one sector's products by another sector. I is the unit matrix, whose elements are 1 on the diagonal and 0 in the other positions. In matrix calculations, the role of the unit matrix is equivalent to the role of 1 in the four fundamental operations or arithmetic.) Economic mathematical models are an important form of scientific abstraction and high-powered synthesis. They are the intermediate links between economic theory and economic reality. They simplify economic reality under the guidance of economic theory, but mainly speaking they are essentially similar or identical to economic reality. Thus, we can use such "simplication" to "master many different things, which can be recognized by the senses, according to their common properties." (Engels" Dialectics of Nature," "Collected Works of Marx and Engels," vol 20, p 579) Such simplication also helps us to obtain relevant materials from the economic reality which can then be studied in depth. Therefore, economic mathematical models represent certain economic contents and also possess definite mathematical forms. That is, they represent economic processes and economic links in mathematical form. They can be used as tools for theoretical study as well as means of solving specific economic problems.

As in other kinds of quantitative analysis, the prerequisite for formulating and employing economic mathematical models is to conduct in-depth qualitative analysis and detailed revelations of concepts, categories, laws and the nature of economic relations and of relations of interdependence. For example, when we study the socialist economic structure, to formulate and use the economic mathematical model of balanced links between one sector and another, we must clearly understand theoretical concepts such as "sector," "consumption," and "commandeering," categories such as "end product," "semifinished product," "production-related technology" and "socioeconomic relations," as well as the essential relationship between development of production and satisfaction of needs in the basic economic law of socialism, in particular the actual social needs, the quantity and composition of the residents' consumption needs, the differences and relations between the demand that can be planned and is backed by purchasing power and the market demand that is affected by price changes and supply and demand relations, and so on. If these things are not clearly understood, practical results will be difficult to achieve. Therefore, we must pay attention to and develop the quantitative study and analysis of the socialist economy and at the same time strengthen the qualitative study and analysis of economic theory. Only thus can be better integrate these two aspects. Problems of the socialist economy have not been subjected to due quantitative study, and this is not unrelated to the fact that our study of their qualitative characteristics has been far from specific and what we have revealed has been very inadequate.

Second, we should perfect and develop the basic work concerning economic information and data.

It is inconceivable to develop quantitative economic studies without a great deal of reliable economic information and data, just as it is to carry out material production without raw materials. Over the past 30 years or more, various departments, regions of our country as well as such comprehensive agencies as planning commissions and statistical bureaus, have accumulated a substantial wealth of valuable historical materials concerning economic development. In particular, because under our country's socialist system the enterprises do not have "commercial secrets," we have been able to obtain comprehensive national information through the unified system of submitting report forms. However, we should note that our country's basic work concerning economic information and data is still relatively incomplete and has been particularly badly disrupted over the past 10 years or more. Data are confused, information is incomplete, figures unreliable, indicators are not uniform, and accounting, business accounting and statistical accounting are inconsistent with planning materials--these chaotic conditions have yet to be conscientiously rectified and completely overcome.

According to the needs of quantitative study, methods of improving the work concerning economic information and data include the following. 1) We can sort out the available historical information and data and improve their utilization ratio. Under the precondition of following the necessary security systems specified by the state, we can lift the restriction on as much economic information and data as possible and let them play a role in theoretical research work to serve the four modernizations. 2) We can improve accounting and statistical accounting as well as fully bringing into play accounting information, particularly statistical information. We need to improve and strengthen the keeping of original records and the calculation of production costs and expenses. Statistical work must not only serve planning work, but also serve economic management and research. It should cease to be an appendage of planning work and should become independent. There must be legislation on statistical work. Only thus can statistical work more satisfactorily play its supervisory role. 3) We can popularize sample surveys and regular general surveys, which are effective means of obtaining important information. For a long time in the past sample surveys were negated and general surveys were seldom organized. This situation should not be allowed to continue. 4) We can strengthen the unifying of economic calculations. Apart from satisfying the special requirements of various kinds of calculations, we can unify as far as possible the approaches of business calculation, accounting, statistical and planning calculation as well as technical economic calculation. Then, economic information can be more scientifically organized and a unifed, modern economic information system can be gradually established.

Third, we should formulate and popularize methods of economic mathematics.

Methods are the means of knowing and changing reality. Correct methods play an extremely important role in scientific research. Mathematical methods are an important means of cognition. Engels called it a "supplementary tool and mode of expression of dialectics." (Engels: "Collected Works of Marx and Engels," "Dialectics of Nature," vol 20, p 357) It is a particular method of cognition in relation to materialist dialectics, which is a general method of cognition. However, it is a general method in relation to various sciences which study the forms of movement of material. The objects of study of the economic science belong to certain identical categories and are comparable. This is the necessary condition for applying measurement, calculations and mathematical methods to them.

The mathematical methods employed in economic theoretical research and practical work include the vector matrix method for calculating complete consumption, the mathematical programming method for selecting the optimum plans, various statistical and mathematical methods for predicting the trend of economic development, the plan evaluation method adopted in economic management, the regressive analysis method for analyzing correlations among various economic factors and so on. Although many of these methods are ready-made and effective, when they are popularized, new problems will appear which call for a mathematical solution. For example, after linear programming had been applied to economics, the new problem of goal programming was raised. (Goal programming is a variant of linear programming. Linear programming generally merely solves the problem of optimizing the evaluaiton of a single goal, but goal programming enables many goals to get as near to the appraised goal value as possible under constraints.) Therefore, developing the quantitative study of economics must not only be guided by correct economic theory and made possible by adequate economic information, but also needs the tools of practical economic mathematical methods which can be easily popularized.

I think the organizational requirements of developing quantitative economic studies include the following. First, we must alter the traditional method of research in the style of the handicraft industry. The highest economic leading body or a certain responsible department of the state should organize the efforts of the relevant research units, institutes of higher learning, economic agencies and so on, as well as recruit experts and scholars in various fields, so that they can cooperate and conduct comprehensive studies involving multiple disciplines. If a few research workers work individually within their specialized fields, then certain problem will remain unsolvable in particular the problems for economic mathematical study concerning the entire national economy, such as making optimum plans for and managing the national economy, making long term forecasts for national economic development plans and so on. Some major research items and tasks involving hundreds of units and thousands of personnel of various kinds should also be organized according to the principles and methods of systems engineering. Second, aside from relying on the combined efforts of those within economic circles, we must also rely on the efforts and cooperation of economists, mathematicians, statisticians, planning experts and specialists in computation techniques. Quantitative economic studies are characterized by possessing many facets and being related to diverse fields. Almost every branch of economic science encounters the problem of quantitative study and that of applying mathematical methods. Even such subjects as economic history and the history of economic thought also involve the question of integration or coordination with quantitative economic studies. When all branches of economic science, each in its own area of study, have actively developed the study of quantitative economic problems, it will not be difficult to sum up the general theoretical and methodological problems in quantitative economic studies and to improve our understanding of such problems. Moreover, large-scale quantitative economic research surpasses the scope of economic science because it involves mathematics and computation techniques. Such a task will be difficult to accomplish without the participation and cooperation of mathematical workers, computation technique personnel and systems analysis personnel. Third, we must establish a new special field of study dealing with quantitative economics and training up a new generation of economists conversant with both economics and mathematics. The students of various economic departments of the institutes of higher learning must study mathematics. Those specializing in certain fields such as quantitative economics must also take more advanced mathematics and computer courses. Economists should master and use mathematics. This is the demand of the times.

III

After launching quantitative economic studies on an overall scale, will a new branch of learning, quantitative economics, be formed? Our answer is affirmative. Of course, limited by the present state of quantitative economic studies, for the time being we still cannot perceive completely and clearly the object of study of quantitative economics, its main contents and its relationship with other branches of economics. Nevertheless, based on our current studies, we already have some conceptual knowledge about its nature.

Quantitative economics is a branch of socialist economic science. Guided by Marxist economic theory and based on qualitative analysis, it employs mathematical methods and computation techniques to study the quantities in and the quantitative relations and changes of the socialist economy as well as the relevant laws. Its object of study is the quantitative aspect of all socialist economic problems. The term economic quantity has wide implications. We cannot merely interpret it as some particular economic quantity which is limited to a numerical economic value. According to Marxist interpretation, the concept of quantity not only refers to the rate, degree, scale and form of existence and development of a thing, but also embodies the relations (Engels said in "Collected Works of Marx and Engels," vol 36, p 202 that "the term rapports relations...refers to the quantitative aspect.") between one thing and another, a thing's structure formed by the arrangement and composition of its component parts as well as the model that reflects the quantitative relations in the thing.

The general content of quantitative economics includes both theoretical quantitative analysis and empirical numerical calculus, both microeconomic and macroeconomic mathematical studies, as well as the application in the socialist economy of mathematical methods, computers and certain related new sciences such as operational research, cybernetics, systems engineering and so on. Establishing and developing quantitative economics is mainly aimed at employing mathematical studies of economics to know and master the laws of socialist economic development more concretely and comprehensively and thus to improve the planning and management of the socialist economy. Therefore, quantitative economics directly serves planning work and economic management. The main contents of quantitative economics are: studying theories and methodologies concerning economic quantities (in particular establishing and using theories and methodologies of various economic mathematical models), the economic mathematical analysis of socialist expanded reproduction, studying joint equilibrium among sectors, optimum planning and management of the national economy, studying economic forecasts and forecasting methods, studying economic cybernetics, the economic calculation of price formation, appraisal of investment effectiveness and testing of investment plans, the optimum use of resources, as well as the economic mathematical study of various problems such as the location of production, transport and communications, national reserves, population and labor, circulation of commodities, the people's consumption and so on. These contents show that quantitative economics is a comprehensive frontier discipline involving many other disciplines. It integrates political economics, the science of planning, statistics, mathematics and the science of computation. Part of its contents overlap with the quantitative study of other branches of economic science. Therefore, quantitative economics needs to use its own theories and methods to help promote the quantitative study of other branches of economic science according to the practical needs of socialist economic construction. At the same time, quantitative economics should establish common ground with the different economic mathermatical studies of other subjects in order to enrich the general theories and methodologies of socialist economic mathematical studies, promote its own development and provide more guidance for the economic mathematical study of other subjects.

Quantitative economics is a practical methodological science. Its theoretical basis is political economies and the economies of productive forces. It is closely related to the economics of sectors and the economics of special fields of study. It is particularly closely related to technical economics, because these subjects overlap to a considerable extent. For example, there are topics common to both such as the microeconomic topics of the rational assignment of tasks according to the loads specified for various lathes, determining optimum product batch sizes in production, formulating optimum transport plans and so on, as well as the macroeconomic topics of the optimum use of resources and the evaluation and testing of the effectiveness of national economic investment. However, quantitative economics differs from technical economics in that not only does it study quantitative problems involving the productive forces, but it also studies those to do with production relations. In the quantitative study of the productive forces, technical economics emphasizes studying microeconomic problems (those concerning enterprises, sectors and individual factors of production) as well as appraising, testing and predicting the economic effectiveness of technological policies, plans and measures. However, quantitative economics emphasizes studying macroeconomic problems (overall problems concerning the national economy) as well as formulating, analyzing and applying economic mathematical models.

Since the early 1960's, we have used the term "economic mathematical methods" for the application of mathematical methods in economic research and planning work. This term is appropriate for a field of study but not for a branch of learning, because although each discipline has its own methods, it is not equivalent to its methods. Comrade Mao Zedong said: "The sciences are differentiated precisely on the basis of the particular contradiction inherent in their respective objects of study. Thus the contradiction peculiar to a certain field of phenomena constitutes the object of study for a specific branch of science." (Mao Zedong: "Selected Works, " "On Contradiction," the People's Press, 1966 Horizontal Typeset Edition, vol 1, p 284) Judging from this requirement, "quantitative economics" reflects its object of study more clearly than "economic mathematical methods." Nevertheless, it is necessary to preserve the term economic mathematical methods in quantitative economics. It can be used as the generic term for various mathematical methods employed in theoretical studies of economics and in practical economic work. If we replace economic mathematical methods with quantitative economics as the name of the new subject, so that it becomes another independent subject, then does this mean that the quantitative analysis of the socialist economy is isolated from various branches of economics, which consequently change over to purely qualitative studies? Such a worry is unnecessary. When we study the quality of the object of study of any science, we must also study its quantitative aspect, which constitutes an inseparable part of its contents. However, this fact does not affect the existence of mathematics as an independent science specializing in quantitative studies. Is the same reasoning not applicable to the relationship between quantitative economics and other branches of economics? The role and position of quantitative economics in economics is equivalent to the role and position of mathematics in science. Quantitative economics has this unique object of study and content: the application of the theories and methodologies of mathematical methods and computation techniques in theoretical studies of economics and practical economic work. Quantitative economics will not take on or replace the varied quantitative analyses in other subjects. On the contrary, it will conversely promote the development of such quantitative analyses.

Quantitative economics differs from economic mathematics. The latter refers to mathematics that is applied in economics. It is a branch of applied mathematics, not of economics. Quantitative economics is also different from mathematical economics, which is bourgeois economic theory expressed in mathematical form. Since mathematical economics began to develop during the earlier half of the 19th century, its famous leading exponents, such as Cournot, Jevone, Walras, Pareto, Allen and so on had replaced qualitative studies with quantitative studies, using mathematics as the most important tool for studying economics.

Quantitative economics also differs from econometrics in principle. Econometrics is a branch of Western economics with a history of over four decades, characterized by the integration of economic theory, statistics and mathematics. (The Norwegian economist Frisch, founder of econometrics, said in 1933 in the editorial of the first issue of the Journal ECONOMETRICS: "Experience demonstrates that each of the three viewpoints of statistics, economic theory and mathematics is a necessary but insufficient condition for a genuine understanding of the quantitative relations in modern economic life. A combination of the three will be powerful. Such a combination constitutes econometrics.") Tinbergen, a leading exponent of econometrics, said: "Econometrics may be defined as the statistical observation of theoretical concepts or as a kind of mathematical economics which measures statistical information." (Tinbergen: "Econometrics," edited and printed by the Economic Research Office of the Bank of Taiwan, p 8) Econometrics differs from mathematical economics in that: 1) econometrics conducts an empirical appraisal of economic relations and uses statistical information to estimate the numerical values of economic parameters, and 2) it considers economic relations as imprecise ones and takes into account random factors in economic calculations. We should adopt the attitude of one dividing into two toward econometrics. We should be good at assimilating its achievements and should also eliminate its errors. It is wrong to completely negate econometrics, in particular its practical parts and some of its methods and techniques. It is equally wrong to copy everything from econometrics and give it a new label. Proceeding from our country's practice in socialist economic construction and guided by Marxist economic theory, we should take the role of Western econometrics in capitalist economic development as a reference. We should exploit the achievements of modern natural science to establish and develop our quantitative economics which has characteristics of its own.

According to their own needs, the Western bourgeoisie employed mathematical methods for quantitative studies and established their mathematical economics, econometrics and so on. Why can our country's proletariat not use mathematical methods and computation techniques, launch quantitative economic studies as well as establish and develop Marxist quantitative economics according to the needs of achieving the four modernizations, building socialism and building communism? We can definitely achieve this. Moreover, we can rectify the quantitative analysis and study which has been distorted by bourgeois economics over the past century or so, so that they can healthily develop and advance along the road of materialism and dialectics. It can be predicted that the rapid development of quantitative economics will definitely add luster to Marxist economic science and help to strengthen socialist construction!

'JINGJI YANJIU': INVESTIGATIONS IN FARM PRODUCTS PRICING

HK270740 Beijing JINGJI YANJIU in Chinese No 11, 20 Nov 80 pp 38-43

[Article by Li Yingzhong [2621 2091 0022] and Li Yuzhu [2621 3768 3796], Agricultural Economic Research Institute of the Chinese Academy of Agricultural Sciences: "Why Peasants Are Not Enjoying in Full the Advantages From the Raising of Prices for Agricultural and Subsidiary Products"]

[Text] The purchasing prices of major agricultural products such as grain, cotton, edible oils and pigs have been increased considerably since 1979. Practice over the past year and more has proved that this important measure has played a major role in promoting agriculture production, increasing peasants' income and developing purchases and supplies of agricultural products. But following increases in the prices of major agricultural products, there occurred some problems in the purchase of agricultural and subsidiary products. One of the problems with widespread signifiance is that the peasants are not enjoying the full advantages from these price raises. This article is intended to probe into the appearances and reasons of this problem and to study the problems of the present purchasing system for agricultural and subsidiary products.

I

The reasons that have prevented peasants from enjoying the full advantages from the price raises of major agricultural products are that there exist some factors to offset part of the income due to them. Practice over the past year and more showed that these factors vary in form; these factors can be put into two categories: one factor directly influences the monetary income of the peasants and this factor is related with the purchases of agricultural and subsidiary products; another factor indirectly influences the actual income of the peasants and it is related to the people's communes, production teams and peasants when they are buying commodities. In this respect, we carried out investigations in Jingmen and Xishu prefectures of Hubei Province and in Wendeng Prefecture of Shandong Province. The following is an explanation arrived at after investigations into the situations.

The factors that directly influence the monetary income of the peasants can be divided into the following main points.

First, some of the standards for grading the quality of agricultural and subsidiary products are too high. Grading standards for purchasing agricultural and subsidiary products are too high. Grading standards for purchasing agricultural and subsidary products are the regulations which determine the quality of agricultural products, therefore changes in these standards influence the price levels of the products and directly influence the income of the peasants. It is true that the purchasing prices of agricultural and subsidiary products have been raised, but at the same time the grading standards for purchasing such products have also been raised, consequently, peasants cannot enjoy in full the advantages from the raising the prices of their products. For example, the Yandeng People's Commune of Jeingmen Prefecture in Hubei Province sold their grain according to the new standards which demanded high quality in unpolished grain and cereals and less water content and impurities than the standards previously used in locality. In 1979, the commune sold 18.407 million jin of grain, of which were 15.9389 million jin of semilate rice, 2.335 million jin of early rice and 133,100 jin of late rice. According to the previous standards, sale prices were for semilate rice, 12.08 yuan per 100 jin, for early rice, 11.73 yuan and for late rice, 12.775 yuan. But according to the new standards, their prices were respectively 11.9 yuan, 11.55 yuan and 12.25 yuan. That is to say, because of the raising in purchasing standards, peasants got 0.18 yuan less from the sale of each 100 jin of semilate and early rice and 0.525 yuan less from late rice. Consequently, the whole commune got 33,600 yuan less. Here is another example, the standards of diameter for large apples in Yantai region of Shandong Province were raised from 55 millimeters to 60 millimeters and for small ones from 50 millimeters to 60 millimeters. The number of the bruises were previously not limited for these two categories of apples, but now it has been limited to three. As a result, part of the fruit harvest was downgraded. Statistics of the departments concerned of Wending Prefecture showed that owing to these 2 standards that have been raised, the income of the peasants throughout the prefecture decreased by about 300,000 yuan. The original standards were later restored, but the decreases in the income of the people's commune and production teams caused by changes in the standards were yet to be made up. The samples for the purchase of tea in Xishui Prefecture of Hubei Province were in the past respectively taken from the spring, summer and autumn tea harvests. But last year the samples were only taken from the spring tea. It means that purchases for the tea produced in the three seasons were based on the samples taken from one season only. As the tea grows well in spring, therefore to take the sample from spring tea as the criterion means that the grades of the standards for purchasing summer and autumn tea were raised. In respect of medical herbs, it was previously defined that the number of first quality dried rhizome of rehmannia must not exceed 4 in a jin. But last year it was changed that the weight of each medical herb must be above 2.5 liang. Similar changes were also made for second grade and fourth grade herbs.

Second, purchasing prices of some agricultural and subsidiary products have been lowered. In the past, there was a regional disparity in the purchasing prices of the apples produced in Yantai region and those produced in other regions of Shandong Province. That is, the purchasing prices in other regions were 0.01 yuan higher per jin than Yantai region. But at last the disparty was abolished. That is to say, the purchasing prices for other regions in the province were scaled down to the level of Yantai region. The province produces about 1,000 million jin of apples per year, excluding Yantai region, therefore with the disparity abolished, the peasants' income consequently decrease by about 540,000 yuan. The purchasing prices for dried rhizome of rehmannia in Xishui Prefecture have also been lowered by an even greater margin.

Third, suspending and limiting the purchase of agricultural and subsidiary products. In 1979, the purchases of more than 103 varieties of agricultural and subsidiary products in Jingmen Prefecture were suspended and limited; these varieties made up one-fourth of the varieties of the products purchased from the prefecture every year. As a result, the peasants received 540,000 yuan less in income or on the average 0.51 yuan less income per capita. Similar situations happened in Xishui and Wendeng prefectures. These problems are more prominent in the purchase of agricultural and subsidiary products.

Fourth, forcing grades and prices down which is disadvantageous to the peasants' interest. This situation often happens during the purchase of agricultural and subsidiary products. For example, in purchasing live pigs it is very often that the weight of a pig is deducted by as much as 20 jin for fodder. In addition, in purchasing pigs, poultryand eggs, a half jin or liang is not calculated. In purchasing cotton, the deduction for the weight of bags has been increased, while in purchasing peanuts the prices are based on the pride of peanut oil. A production team of a people's commune of Xishui Prefecture last year wanted to sell 15,275 jin of cotton to a cotton purchasing station but it refused to sell after it was informed by the station that it judged the cotton to be neither grade 1 or grade 2. The production team then presented the station with 100 jin of peanuts and its cotton was consequently purchased by the station. The cotton was grade as having 7,831.5 jin of grade 1 cotton, 51.3 percent of the total. The rest was judged to be grades 3, 5 and 7. It is also very common that in purchasing agricultural and subsidiary products, different purchasing stations give different grades for the same products.

Fifth, changes in checking and purchasing system and unjust service charge. For example, the fruits of major producing areas in Shandong Province were previously checked and purchased by supply and marketing department on the spot. But this method has been changed since last year. All the fruits that are for sale must be gathered at an appointed place or sold at an appointed marketing point where they are checked and purchased jointly by the purchasing departments of the region, prefecture and locality. It means that purchasing responsibility is taken by three levels, but the fact is none of them is responsible. Any damage to the fruits occurring in transporting them must be borne by the producing units while the purchasing units are only responsible for damage resulting from natural phenomena. Some production units have managed to sell their fruits directly to other purchasing departments yet these departments still have to charge these units just for issuing receipts.

The factors that indirectly influence the actual income of the peasants include raises in the prices of byproducts of grain and edible oil such as chaff cakes, wheat bran and rapeseed cakes that are purchased by peasants after they have sold their products. In addition, the growth in the prices of these byproducts is higher than that in the prices of grain and rapeseed. Peasants also are suffering losses in many other aspects such as increases in the prices of farm machinery products, shortages in weight of chemical fertilizer and pesticides and ineffectiveness of pesticides.

The abovementioned problems not only affect the income of peasants and their initiative but also enhance the contradictions between agriculture and commerce to create tense relations. These problems are not in the interest of business management of purchasing departments. Such problems merit our attention.

II

The abovementioned factors that have directly affected the income of the peasants have widespread significance. But what are the reasons for all these problems? Our investigations showed that there are many reasons, but major reasons must be singled out from the present system of purchasing agricultural and subsidiary products.

The investigations showed that purchases of our agricultural and subsidiary products are mainly carried out in three forms: state monopoly, purchases by purchasing departments through arrangement and purchases through consultations. The first two are the main forms because about 80 percent of the agricultural and subsidiary products are purchased through these forms. Under the present management system, purchases of agricultural and subsidiary products through state monopoly and purchases through arrangement have stressed the importance of autonomy being centralized by the state with regard to the relations between the state and the units of the collective economy. That is to say, purchase planning, prices and standards of purchasing and quantity are all determined by the state. In addition, purchases of agricultural and subsidiary products are undertaken only by the departments concerned. This management system has a basic defect of violating the demand of the law of value. Under this management system, the units of the collective economy are not considered as producers and sellers of commodities, therefore they have been deprived of some basic rights that producers and sellers of commodities should have. This situation is not in the interest of implementing the principle of exchanges of equal value and has a very strong compulsory nature.

First, the system of purchasing agricultural and subsidiary products through state monopoly and through arrangement has deprived the units of the collective economy of most of their autonomy in production and in selling their own products. Both varieties and quantity of the agricultural and subsidiary products that are purchased through state monopoly and through arrangement began to be implemented in the early and middle 1950's. No doubt it must be affirmed that practice over the past two decades and more has proved that for a country with such a backward agriculture as ours, such a measures has played its positive role in insuring the basic needs of the state construction and the livelihood of the people. But it has also exposed its defects. A major defect is that units of the collective economy, whether they intended or not and irrespective of volume of economic interest, must fulfill production and sales quotas assigned by the state. Consequently, these units have been deprived of most of their autonomy in production and the autonomy of selling their own products. Thus under this system, it is impossible for the people's communes and production teams to base themselves on the need of the law of value and determine the kind of crops they should grow and the acreage of the crops according to the volume of economic interest. As a result, it is more often that the tasks assigned them by the state are contradictory to their own economic interest. This contradiction becomes even more apparent under the situation in which price parities among agricultural and subsidiary products are not rational.

Quite a number of people's communes and production teams have to produce and sell agricultural and subsidiary products just to fulfill state quotas even if they know that by doing so they would have little income or even lose money. This system can also easily result in purchasing "overlimit grain" to the detriment of the need of the people's communes, production teams and commune members themselves. Peasants in some places who failed to produce an adequate quantity of certain farm products have to purchase them from free markets at higher prices and then sell them to the state so as to fulfill their sales quotas to the state. This system thus runs counter to the voluntary principle in treating peasants and dampens their initiative. With implementation of the party's economic policies in rural areas over the past few years, the cases of purchasing "overlimit grain" and of peasants purchasing certain farm products from free markets and then selling these products to the state have become rare. But forcible monopoly purchasing by the state and arranged purchases without giving consideration to the interest of the people's communes, production teams and peasants are still common.

Second, with their agricultural and subsidiary products solely purchased by a single department, the units of the collective economy have been deprived of the right of selecting the targets for their sales. Our agricultural and subsidiary products are purchased by the departments belonged to a single system from the party Central Committee down to locality. In addition, purchasing departments at various regions can only purchase agricultural and subsidiary products of their own regions and not from other regions. Hence departmental and regional monopoly of purchases are formed. As purchases of agricultural and subsidiary products are monopolized, there is no competition among the purchasing departments. Even if these departments purchase agricultural and subsidiary products at prices that harm the economic interest of the people's communes, production teams and peasants, the departments do not have to worry that they cannot purchase the products. But the people's communes, production teams and peasants have no other choice in selling their products, they can only sell them to a certain department, a company or even a unit; otherwise they cannot sell them. Under such conditions, the people's communes, production teams and peasants cannot but send their products to purchasing departments for sales. Consequently, it often happens that these departments force prices and grades down to the detriment of the peasants' interest. Some people's communes and production teams have to plead with purchasing departments to purchase their products while others even give dinners and send gifts just to have their products priced and graded rationally. It is also often that the people's communes and production teams find that the prices and grades of their products have been intentionally forced down, but they do not dare to report this to higher authorities. When purchasing departments suspended and limited purchases of agricultural and subsidiary products, the people's communes, production teams and peasants are compelled to find other ways. Some of the products rot, are discarded or burned, all of which affect the income of the peasants and waste social property.

Third, the standards of grading and pricing agricultural and subsidiary products are all formulated by state commercial departments while grading and pricing are determined solely by the purchasing units. As a result, units of the collective economy have been totally deprived of their right to take part in formulating prices and in grading and pricing their own products. The standards of grading agricultural and subsidiary products that are purchased by the state monopoly and through arrangement are formulated by the state. But concretely speaking, these standards are formulated by the departments concerned on behalf of the state in two different ways. The standards for major agricultural and subsidiary products that are related to the national economy and the people's livelihood are jointly managed and formulated by purchasing departments, comprehensive standardization departments and the State Planning Commission. The standards for other agricultural and subsidiary products are formulated by the purchasing departments. In the former case, purchasing departments have the right to participate in formulating the standards (not the sole right of formulating the standards); but in the latter case, they have the sole right to do so. In the activities of purchasing agricultural and subsidiary products, purchasing departments have the right to check and grade as well as determine the prices of the products. But on the contrary, the units of the collective economy, that is the owners of commodities and sellers of agricultural and subsidiary products have been deprived of any right. They can only sell the products according to the standards formulated by the state and the prices determied by purchasing units. Thus imbalance in the right between the two sides during exchanges of commodities has become a major factor leading to unequal value in the purchase of agricultural and subsidiary products. Because under this system, if purchasing departments and units do not follow party policies and do not proceed from the point of developing agricultural production but just consider their own interest, they will resort to their power and use, an unfair method which in effect amounts to embezzlement of the results of the work done by the units of the collective economy and the peasants.

It must be pointed out that the purchases of our agricultural and subsidiary products are mainly managed by purchasing departments, that is the so-called total centralization of power in the hand of the "state." But the fact is that a considerable part of the power is centralized in the hand of purchasing departments. There has long been a traditional view in our country that commercial purchasing departments and enterprises are state commercial undertakings with the ownership by the whole people and their relations with the units of the collective economy are the relation between the state and the collective and that the interest of commerce is the interest of the state. As a result, commercial purchasing departments are equated with the state. Such view is not complete. In fact, the present state commercial undertakings of the ownership by the whole people are not completely of the "whole people." It is correct that purchasing departments for agricultural and subsidiary products are state commercial undertakings and their means of production belong to the whole people. It is also correct that most of the profits of enterprises are handed over to state financial departments and belong to the whole people, that the basic income of the staff of these enterprises basically comes from the state consumer funds and that the interest of commercial purchasing departments and other enterprises is identical with the interest of the whole people. But we must understand that at the present stage the state commerce with the ownership by the whole people does not completely belong to the whole people and its income is not completely owned by the whole people. There still exists partial ownership by departments and enterprises. Staff and workers still get additional income from the enterprise funds of their own units. Therefore, the interest of commercial purchasing departments and enterprises is not necessarily and totally the interest of the state; such interest includes the interest of the departments concerned and other enterprises. Such partial interest can fully display the motivation of economic interest and encourage purchasing departments and enterprises to do a good job in purchasing agricultural and subsidiary products and improve their management.

But it will also stimulate these departments and enterprises to resort to unfair methods and carry out exchanges of unequal values which amounts to embezzlement of the results of the work of the people's communes, production teams and peasants.

Following the Third Plenary Session of the party Central Committee, the system of the commercial purchasing departments have been under restructuring by way of expanding the decisionmaking power of enterprises that is centered upon profits retention. Thus with their economic interest and power expanded, purchasing departments and enterprises are now willing to display their initiative in improving their business management. But in some places, this measure has brought about or aggravated contention between the interests of the purchasing departments and enterprises on the one hand and those of the people's communes and production teams on the other hand. There also happened that the interests of the people's communes, production teams and peasants were violated. This is one of the important reasons that why peasants do not enjoy in full the advantages from the price raises for major agricultural products. Now the question is how to consolidate and display the initiative of the restructuring and avoid and restrict its negative role while we persist in expanding the decisionmaking power of the commercial departments and enterprises so that enterprises will be able to combine their business achievements with their economic interest. However, our present management system over agricultural and subsidiary products is not in a position to restrict this negative aspect. There is no outside pressure against this system and, on the contrary, it helps promote this negative role to a certain extent. In order to implement the principle of exchanges of equal value in the process of purchasing agricultural and subsidiary products and guarantee the economic interest of the people's communes, production teams and peasants, it is imperative to restructure the present system of purchasing agricultural and subsidiary products.

III

Stalin said that the only form of economic contact between industry and agriculture and between urban and rural areas that is acceptable to peasants is exchanges of commodities through selling and buying. Exchanges of commodities demands that the two sides exchange their products on the basis of equal value; neither side is allowed to expropriate the labor achievements of the other side. It is our party's consistent policy to persist in exchanges of equal value in purchasing argicultural and subsidiary products. The "Resolution on Some Questions of Enhancing the Development of Agriculture by the Central Committee of the Chinese Communist Party" points out: "Commercial work must conscientiously follow the principle of exchanges of equal value so as to promote the interflow of commodities between urban and rural areas. Agricultural and subsidiary products in rural areas must be purchased according to their qualities. Forcing prices and grades down is strictly prohibited." Exchanges of equal value reflect the essence of the relations of exchanges of commodities when agricultural and subsidiary products are being purchased. They not only accord with the demand of the law of value but also constitute a principle that must be followed in activities of purchasing agricultural and subsidiary products. They also constitute an important foundation for restructuring commercial system in rural areas.

How can the principle of exchanges of equal value be reflected in the purchasing system of agricultural and subsidiary products? We hold that under the premises of state guarantee and identical economic interest between purchasing departments and peasants, purchasing departments and producer units must have relative power. Basic conditions for exchanges of equal value must be created so as to guarantee normal economic interest of both sides and restrict their irrational economic interests.

First, the question of respecting the autonomy of the people's communes and production teams. In order to follow the principle of exchanges of equal value in purchasing agricultural and subsidiary products, it must be acknowledged that the people's communes and production teams are units of the collective economy with independent management. The people's communes and production teams must have autonomy in production and must have the power to make decisions on selling their products voluntarily. But to do this it is imperative for the state to use the economic method and means of economy instead of the administrative method in the purchase of agricultural and subsidiary products. The much too stringent state control over people's communes and production teams must be eased. From a long-term point of view, we must create conditions which will change the system of state monopoly for purchasinging and purchasing through arrangement. However, the conditions are yet to be created which will allow the abolition of this purchasing system. It can only be solved gradually and it needs a developmental process. For example, grain, cotton and edible oils that are purchased through state monopoly are basic means of subsistence needed by the people. At present, the quantity of such products throughout the country is not enough to meet the demand by the state and the people and we still have to import a certain quantity every year. The price parities within agricultural and subsidiary products are not rational and there is unlikely to be a drastic readjustment in a short period. Therefore, to enable the state to control the means of subsistence and insure its own need and the need of the people, it is necessary for a certain period to come to persist in the system of purchasing through state monopoly; otherwise a dangerous situation will be created. In order to respect the autonomy of the people's communes and production teams during the activities related to the purchasing of agricultural and subsidiary products and overcome the too stringent control by the state over the people's communes and production teams, it is feasible to start restructuring the purchasing method through arrangement. That is to say, the range of this purchasing method can be narrowed and the varieties of the products sold can be cut down so as to gradually create conditions for abolishing it. Implementing this is completely possible. Following the development of agriculture over the past few years, the purchases of agricultural and subsidiary products through this method have changed quite a lot. The products sold through this method were first in short supply and not able to meet the need of the people. Now they are not only able to meet the need but are even overstocked, thus creating basic conditions for abolishing this purchasing method. Other products that are also sold through this purchasing method but do not influence the national economy and people's livelihood can be sold through other forms even if they are in short supply. In this respect, the demand and supply of such goods can be regulated by the pricing mechanism; that is to say, it can be solved through raising the purchasing and selling prices.

Second, the question of breaking away with the monopoly in purchasing agricultural and subsidiary products. In any exchange of commodities, including purchases of agricultural and subsidiary products by the state, no monopoly is allowed by either side; it is an important condition for exchanges of equal value. Marx pointed out: "The only conditions for exchanges of commodities whose prices nearly equal their value are...this means that in selling and buying, it must be agreed that neither side will embezzle, by artificial means, or intentionally, and thus sell and buy above value or force a commodity to be sold under value." (Marx: "Das Kapital," People's Publishing House, 1956, vol 3, pp 202-203) In order to create conditions for the abolition on monopoly by purchasing departments in purchasing agricultural and subsidiary products, we suggest taking the following three steps. The first step, the people's communes and production teams must have to a certain extent the right to choose the buyers of their products. The people's communes and production teams are allowed to choose buyers of the first and the second categories of agricultural and subsidiary products that must be purchased through the state monopoly and arrangement in a certain sphere (for example to choose their buyers within a prefecture). When the people's communes and production teams have met their quotas by selling their first, second and third categories of agricultural and subsidiary products through state monopoly and arranged purchases, they must be allowed to sell the rest of their products anywhere and this includes cities. Second step, break away from the area limitation and allow purchasing departments of one region to purchase agricultural and subsidiary products in other regions. Third step, with state purchasing departments as the main, supplimentary organizations to these departments must be formed and more channels must be allowed to exist. For example, a locality must be permitted to set up purchasing companies while the people's communes may set them up by themselves or jointly with commercial organizations. Thus competition is in the interest of implementing the principle of exchanges of equal value. It will also help commercial purchasing departments display their initiative and improve their management.

Third, the question on equal rights for purchasing departments and their enterprises and the units of the collective economy. Such equal economic relations must be guaranteed by equal power in the systems of both sides so that they will be consolidated and developed in exchange activities. The management power of the present purchasing system for agricultural and subsidiary products is centralized in the hand of the state and part of the power is centralized in the hand of various purchasing departments. The people's communes and production teams have no power in this respect. This situation is not in the interest of exchanges of equal value. On the contrary, it encourages various purchasing departments to undermine the interests of the people's communes and production teams. Therefore, the present management system must be restructured.

The people's communes, production teams and peasants must be allowed to send their representatives to take part in formulating the standards of grades and prices for the purchase of agricultural and subsidiary products so that they will be able to fully reflect the situations and demands of producers and sellers and solicit opinions in order to represent their economic interests. The people's communes in rural areas are presently using the system of integration of government administration with commune management, the organizations of people's communes and above are under the direct leadership of the people's governments at various levels. No economic or other organizations are directly leading the people's communes and it is difficult for them to send their representatives. Therefore as a transitional measure, it is advisable that agricultural production departments at various levels take part in formulating standards. Further readjustment can be made later when the work of restructuring the agricultural management system begins.

In activities of purchasing agricultural and subsidiary products, the people's communes and production teams must also have the right that is enjoyed by purchasing units with regard to checking, grading and pricing. It is very important to insure that various grading standards for the purchase of agricultural and subsidiary products are implemented, that the products are purchased according to their value and that the forcing down of grades and prices is prevented. In some places, grain departments are using the method of "assessing by production teams and checking by stations." That is, grain purchasing policy, pricing policy, the standard of grading and technology of checking the quality of the grain are all undertaken by production teams and commune members. Assessing teams composed of cadres of production teams, commune members and staff of granaries are formed to assess and inspect the conditions of the grain and sign relevant documents attenting that they have done so. The grain is then sent to state granaries where it is checked by the quality checking staff before it is accepted. With this method, the people's communes and production teams have to a certain extent the power for checking and grading, therefore it is in the interest of exchanges of equal value and in the interest of promoting the relations between commerce and agriculture. When the quality of the grain is lower than actual grade, usually it is caused by the following two factors. One is caused by errors because the standard is far from accurate and is therefore hard to comply, because weighing instruments are not accurate and because of a backward method of checking. Another reason is intentionally forcing down grades and prices. With regard to the former situation, purchasing departments in some places with prefectures as accounting units are using the system of refunding excessive grain. When prefectual companies of agricultural and subsidiary products are settling their accounts or making yearend settlement of accounts and they find that the grading is higher than purchased grading, they will refund the excess funds to the related people's communes and production teams. This method has been welcomed by the people's communes and production teams. With regard to the later situation of forcing down grades and prices, it is necessary to give the people's communes and production teams a specified right for checking and grading and to form a strict supervisory system. Supervision is not only the work of the higher leading bodies of purchasing units and the State Planning Commission, it is also the work of the broad masses of peasants. It is also necessary to carry out spotchecks as well as regular inspections. With regard to the activities that violate the pricing policy and that which are aimed at forcing down grades and prices to undermine the interests of peasants, the people concerned or departments must be criticized and educated; where the situation is serious, the income that is achieved through illegal methods must be refunded or confiscated. In addition, it is necessary to take legal actions and meet out economic punishment so as to prevent such activities.

PRC JOURNAL ON RATIO BETWEEN ACCUMULATION, CONSUMPTION

HK250152 Beijing JINGJI YANJIU in Chinese No 11, 20 Nov 80 pp 49-53

[Article by He Zhenyi [0149 2182 0001] and Chen Lingshu [7115 0109 3219] of the Finance, Trade and Material Resources Research Bureau of the Chinese Academy of Social Sciences: "An Initial Study of the Role of Finance in Correctly Handling the Proportional Relations Between Accumulation and Consumption"]

[Text] Our country's 30 years of experiences in construction are ample testimony that on each and every occasion when there was an imbalance in the proportionate relationship between accumulation and consumption in the national economy, it was directly related to the disregard of the role of finance and the law of finanical distribution and to the poor performance in handling financial receipts and disbursements. Hence, making a serious summation of 30 years of experiences in financial work, upgrading the role of socialist finance in regulating the proportionate relationship between accumulation and consumption and having a clear understanding of the law of financial distribution all have an important and practical significance in insuring the regulated development of the national economy and accomplishing the four modernizations. This article is intended to present our superficial views on problems in this connections.

Role of Finance in Formation of Proportionate Relationship Between Accumulation and Consumption

The ratio between accumulation and consumption is the most basic ratio in the realm of socialist distribution. It centrally reflects the relations of the long-term interests and current interests of the people. It also reflects the interests of the state, of the collective and of the individual. Correctly handling the proportionate relationshp between accumulation and consumption in the process of the distribution and redistribution of the national income provides a pbasic guarantee for the improvement of the people's standard of living, for the rapid development of socialist production and for the smooth accomplishing of the four modernizations.

The ratio between accumulation and consumption is ultimately formed through the process of distribution and redistribution of the national income. Under the system of public ownership of the means of production, finance is the basic means by which socialist states effect distribution and redistribution of the national income in a planned manner and using a form of value (currency) as a medium. Representing the demand of social groups and representing the common interests of the whole body of workers, finance takes part in the primary distribution and redistribution of the national income and is the organizer of the collection and distribution of funds for the satisfaction of the common needs of the entire social structure. It is capable of regulating the direction of use of the national income and plays the decisive role of regulating whether the ultimate form of the proportion between accumulation and consumption is rational or not. It is true that the proportion of value between accumulation and consumption is governed by the concrete material structure of the national income available for accumulation and consumption. If the condition of the concrete material structure of the national income is neglected in the distribution of the form of value of the national income, confusion may be caused in commodity circulation which will complicate the normal realization of accumulation and consumption. However, the structure of material resources of the national income has a certain degree of elasticity. Some of the products may be used as means of production and also as consumption goods; some may be used in production and also in capital construction. This determines that while the material structure of the national income is fixed within a definite period, the proportion of material resources used in accumulation and consumption can also change within certain limits. Therefore, the proportion fixed in financial distribution can directly bring about a reciprocal transfer of material resources between accumulation and consumption. In this way, finance plays a decisive and regulatory role in the ultimate formation of the proportionate relationship between accumulation and consumption in national income. This role is concretely illustrated in the following:

Whether the consumption level of the individual producer is high or low is determined by the size of the portion which finance musters in the initial distribution of the national income. The initial distribution splits the national income into two portions. One portion may be termed portion "v" which is for the workers' individual consumption. The other portion may be termed portion "m" which is for meeting the common needs of society. Portion "m" consists mainly of financial receipts which the state has mustered (the portion retained by the enterprises for production purposes will not be discussed here). Portion "v" does not come under the financial distribution of the state, but what proportion it occupies in the national income and whether or not it can be increased in the event of production development is directly regulated by the arrangements for the financial receipts. Within a specified period, the national income is a fixed figure. If the portions mustered by finance in the initial financial distribution are large, then what remains for satisfying the individual needs of the workers will be small. Hence, whether the arrangements for the financial receipts are adequate or not plays a decisive role in regulating the level of livelihood of the individual worker.

Next, the condition of the use and distribution of financial funds regulates the condition of the ultimate proportionate relationship between accumulation and consumption. After the initial distribution of the national income, redistribution must follow before the ultimate proportion between accumulation and consumption can be formed. The proportion between financial disbursements of an accumulation nature and those of a consumption nature determines whether the ultimate proportion between the use of the national income of the current year on accumulation and that on consumption is rational or not. Through the initial distribution, the national income is divided into the "v" and "m" portions. The size of Portion "v" determines the level of consumption for each individual production workers while the size of portion "m" determines the level of accumulation to a certain degree. In this context, it may be said that a general idea is formed for the proportion between accumulation and consumption, but portion "m" cannot be devoted entirely to accumulation, since a portion has to be spent on the individual consumption needs of the workers in the administrative departments and in the enterprises and also on the collective consumption needs of the workers. Hence, the ultimate formation of the proportion between accumulation and consumption will have to be determined by the manner in which portion "m" has been utilized. As for how "m" is expended, a great proportion is determined by the planning for the financial disbursements. If in planning the financial disbursements, those of an accumulation nature predominate, then in the proportionate relationship between accumulation and consumption, the weight for consumption will be reduced. Contrarily, the proportion for consumption will be increased. For this reason, it may be said that financial disbursements exercise a direct regulatory role on the ultimate formation of the proportion between accumulation and consumption in the national income.

Objective Quantity Limits Which Financial Receipts and Disbursement Must Observe

How much income can be derived for finance each year, what order of priority governs the various financial disbursements and how much money can be allocated to each financial disbursement cannot be decided by man's subjective wishes. They all have to follow certain regulations and have their own objective quantity limits. In addition, an order of priority must be followed. These quantity limits and order of priority are determined by a definite level of productive force and by socialist production objectives. The starting point for financial distribution should be fulfillment of the material and cultural needs of the people's livelihood and in planning for the financial disbursements the order of those of a maintenance nature first and those of a development nature second must be followed. In this way, financial receipts and disbursements are subjected to a list of objective quantity limits the principal ones of which are as follows:

1. Quantity limits of financial income

The first is the maximum limit on increases in financial income. This limit is subject to the following factors: 1) Regulation by the condition of increase in the national income for the current year. An increase in income must be preceded by an increase in the national income of the current year. If there is no increase in the national income and the financial income mobilized is larger than that of the preceding year, then the surplus portion will lack the backing of material resources and a portion of the financial income is false. If disbursements are arranged on the basis of this false income, then in reality a hidden deficit has been generated. This will derange the normal proportionate distribution of the national income, lower the actual living standard of the people and inflict disaster on the national economy. 2) Regulation by portion "m" of the increase in the national income. If the national income for the current year is increased, then finance can make use of more income. But it cannot use all of the increased income and is confined to portion "m" only. The national income is composed of two portions. One portion is value "v" which is to satisfy the individual needs of the workers. The other portion is value "m" which is to satisfy the common needs of society. Finance can derive its income only from the "m" portion of the national income. If this realm is exceeded then the consumption portion for the individual workers will be encroached upon. How bid the "m" portion of the increase in the national income can become is again governed by three factors (Note: This "m" portion is derived from computing the proportion between "v" and "m" of the base period and not the "m" portion ultimately formed in the distribution of the national income of the current year; same below), namely: 1) Economy in the use of production materials in the production process; 2) Rise in labor productivity rate; and 3) Addition of new labor productive force. Under conditions where prices remain unchanged and the laborers maintain the same standard of living as in the base period, if the increased portion of the national income is due to the first two factors mentioned above, then the entire increased portion belongs to the "m" portion. On the other hand, if the third factor accounts for the entire increase, then only part of the increase belongs to the "m" portion. The size of this new "m" portion is determined by the proportion between "m" and "v" of the national income in the base period and the larger the proportion "m" occupied then the larger the "m" portion of the increased national income now. If the newly increased portion of the national income is due to a combination of all three factors, then the size of the new "m" portion is determined by the relative importance of the three factors and by the proportion between "m" and "v" in the base period. It follows that the smaller the proportion occupied by the factor of additional labor force the larger the "m" volume and that the larger the proportion attributable to economy in production materials and to a rise in the labor productivity rate likewise the larger will be the "m" volume. The size of the "m" portion of the increased part of the national income determined by the abovementioned factors is the maximum amount of possible increase in the financial income of the current year. Under the socialist system, except in case of war or other contingencies, mobilization of financial income should never exceed this maximum limit, otherwise the national economy and the people's livelihood will be endangered.

Let us turn next to the workable limit on the incrase of financial income for the current year. The "m" portion of the increase in the national income which is derived from computing the proportion between "m" and "v" of the base period is not the final quantity limit which finance can possibly mobilize. How much of the "m" portion of the newly increased portion of the national economy can be mobilized to increase financial receipts is further regulated by the following two factors: 1) It is regulated by the rate of population growth. The increase in national income of the current year must first of all be used to insure that the standard of living of the newly increased population is not lower than that in the base period. If the national population growth rate is not taken care of by using a portion of the newly increased national income to satisfy the livelihood needs of the new increased population, the the universal lowering of the actual standard of living of the entire masses of workers will be entailed and this will be contrary to the basic economic law of socialism. The quantity limit for insuring the livelihood needs of the newly increased population is the product of the gross consumption volume in the base period multiplied by the population increase rate or the product of the average per capita consumption in the base period multiplied by the size of the population growth. 2) It is regulated by the average increase rate in per capita consumption of the productionworkers. The basic economic laws of socialism require that from the increase in national income a portion must be used to increase the per capita income of the workers and thus to raise their standard of living. This portion cannot be mobilized as financial income. How is the amount of this volume derived? The answer is that it is determined by the yearly average increase rate and the volume is the product of the gross consumption volume of the workers in the base period multiplied by the planned rate of increase in the standard of living. The sum of the above two factors is the second quantity limit which must be deducted when planning the actual amount of increase in financial income.

2. Quantity limits of financial disbursements.

First is the minimum quantity limit of disbursements of a consumption nature for the current year. This limit is made up of two parts. One part consists of the consumption volume which was reached in the base period by workers in the administrative and enterprise departments, that is to say, the volume of expenditure spent in the preceding year on meeting the consumption needs of workers in nonproductive departments. The second part consists of the volume of expenditure spent in the base period on meeting the collective consumption needs plus the minimum volume of expenditure for collective consumption which must be increased to correspond with the increase in population. The sum of the above two items is the minimum quantity barrier that must be insured in the financial disbursements of a consumption nature. This volume is the minimum amount which must be insured in determining financial planning. If this is not observed, then the actual standard of living of the masses will be lowered.

Next is the minimum volume of accumulation disbursements of a nonproductive nature. This is the necessary volume barrier to insure that there is no reduction in the level of cultural, health and other benefits enjoyed by the laborers. At present, there is a population increase every year. This requires that society must not only appropriately effect increases in expenditure in order to satisfy the individual's consumption needs but also appropriately increase accumulations of a consumption nature in order to insure increases in public facilities such as residences, nurseries, public health institutes, schools and so forth. If in planning financial disbursements no additional disbursements are arranged in this connection despite the increases in population, then it would hardly be possible to insure maintenance of the level of benefits in culture, public health and other sectors. The minimum increase in volume of this nonproductive accumulation consists of two parts. One part consists of the minimum required volume of fixed assets of a nonproductive nature. The formula for its calculation is to find the product of multiplying the figure of population increase in the current year by the average per capita fixed assets of a nonproductive nature of the preceding year. The second part arises out of the need to appropriately increase the volume of articles for consumption as reserves in view of the increase in per capita consumption. This is the product of multiplying the minimum volume of increase in consumption goods by the coefficient of reserves of consumption goods at the preceding year's level. The sum of the funds required for the above two items is the minimum volume of accumulation disbursements of a nonproductive nature which must be taken care of in planning financial disbursements.

Now let us turn to the minimum volume of accumulation disbursements of a productive nature. This is the minimum accumulation volume required for expanding the reproduction of consumption goods to insure that the level of the people's livelihood will not be lowered. In order to insure meeting the consumption needs of population increase, society must step up the production of consumer goods and must increase investments in expanding the reproduction of consumer goods. This kind of necessary minimum amount of investment of a productive nature is the minimum volume of increase in accumulations of a productive nature that is required. The numerical value of this volume is the product derived from multiplying the investment coefficient by the sum of the gross value of consumption goods which must be increased on the basis of the increase in population plus the gross value of the production materials which must be increased in order to produce these consumption goods.

The above represent the minimum limits for insuring that the original level of the people's livelihood will not be lowered. We call the three of them the minimum limits of disbursements of a maintenance nature. After having made financial arrangements for these disbursements of a maintenance nature, the remaining portion may then be used to further raise the people's current standard of living and to further increase investments of an accumulative nature. This category of disbursements we call disbursements of a development nature.

The quantity limit for disbursements of a development nature is the balance of the current year's total quantity limit for financial income minus the quantity limit for disbursements of a maintenance nature. In the financial planning for disbursements of a development nature, we cannot allow the spending of the entire balance after deduction of disbursements of a maintenance nature on increasing the accumulations of a productive nature. Suitable arrangements must still be made between accumulation and consumption and this is again regulated by several other quantity barriers. They are: 1) The minimum quantity limit for disbursements of a consumption nature which must be increased in order to annually raise the people's standard of living based on the premise of production development, including the minimum quantity limit for increased consumption on the part of workers in nonproductive departments and also the quantity limit for increased consumption of a collective nature. 2) The minimum quantity limit for accumulations of a nonproductive nature which must be increased in order to insure an annual rise in such collective welfare benefits as those pertaining to culture and public health. In the financial planning for disbursements of a development nature, all these minimum quantity limits must be insured otherwise if the disbursements of a development nature are devoted entirely to disbursements for accumulation of a productive nature, then there will be a lack of harmony between production and living in the ensuing years and there will be an imbalance in the proportion between accumulation and consumption.

Our actual experiences for the past 30 years in financial work have amply proved that if the quantity limits in financial income and disbursements are violated then the national economy will be seriously endangered. On the other hand, if they are respected and work is done in accordance with those objective quantity limits, then finance will be able to play a positive role in correctly handling the proportionate relationship between accumulation and consumption, thus insuring the smooth development of the national economy. During the period of the First Five-Year Plan, when planning income, due regard was given to the condition of increasing the national income and it was possible to achieve an increase in financial receipts in accordance with the size of the"m" portion of the increase in national income and at the same time appropriately raising the people's standard of living. With regard to disbursements, those of a maintenance nature and those of a development nature were thought out rather comprehensively and were comparatively and objectively in accordance with the order of procedure and the quantity limits. The result was that the proportion between accumulation and consumption was comparatively harmonious, that production achieved rapid development and that people's standard of living was improved rather considerably. During the period of the Second Five-Year Plan, due to people getting "swell-headed" and to the influence of boastfulness and blindly seeking high targets, financial work disregarded objective laws. From 1958 to 1960, for 3 years in succession, we violated the quantity limits which governed the increase in financial income in relation to the increase in the national income. In 1958, the national income increased by 21 billion yuan over the preceding year. The labor productivity rate was down by 8.5 percent. Consumption of production materials increased. Hence, the increase in national income was basically due to new labor power being injected into production. According to the objective quantity limit, the additional increase which finance could muster should be at most around 10.1 billion yuan. Yet the actual increase was 13.3 billion yuan, in other words, 3 billion yuan more. In 1959, the national income increased by 10.4 billion yuan over 1958. On the basis of the workable limit for the increase in financial income, the increase in financial income should only have been 3.2 billion yuan. Yet the actual increase was found to be 13.5 billion yuan. In this way, the entire portion of the increase in the national income was cumulated and in fact was exceeded by over 30 percent. What was more serious was that in 1960 the national income took a downward turn in comparison with 1959. If the objective quantity limit governing financial income was followed, then basically speaking financial income could not be increased, but actually an increase of 5.6 billion yuan was made over the preceding year. On the side of finanical disbursements, the objective requirements of "following the order" and "quantity limits" were also completely ignored. Earnest efforts were made one-sidedly to increase accumulation disbursements for capital construction. In particular, in 1960 the financial income of that year was only increased by 5.6 billion yuan but the increases in capital construction disbursements amounted to 6.7 billion yuan. This seriously violated the quantity limit which financial disbursements must obey. As a result, the ratio of accumulation in the disposition of the national income was greatly increased. In 1958, accumulation accounted for 33.9 percent of the national income but went up to 43.8 percent in 1959 and to 39.6 percent in 1960. Due to this situation of a serious imbalance in the proportionate relationship between accumulation and consumption, the people's livelihood could not be improved and the people's enthusiasm for production was dampened. It also brought about an average yearly decrease of 4.3 percent in farm production during the Second Five-Year Plan period. Industrial labor productivity dropped by 8.5 percent in 1958, was down 7.5 percent in 1959 and fell sharply by 28.8 percent in 1961. All these factors, plus the occurrence of natural disasters and the Soviet Union perfidiously rescinding agreements and contracts, brought about serious difficulties to the national economy, making it necessary for its all-round readjustment. In the course of the readjustment, financial income and disbursements closely followed the quantity limits which, objectively speaking, must be obeyed. In planning the disbursements, investments in capital construction were first of all greatly curtailed. Such investments in 1961 were reduced by two-thirds in comparison with 1960 while in 1962 they were again curtailed by one-half compared with 1961. In this way, the proportionate relationship within the national economy was gradually restored to normal. In 1964, accumulation recovered the normal proportion of 22.2 percent of the national income, and the national economy achieved a rapid recovery and development. However, between 1966 and 1976 the national economy again suffered interferences and disruptions, this time from Lin Biao and the gang of four. In economic work it was impossible then to follow economic laws. As a result, the national economy was on the verge of bankruptcy. In general, the two "ups and downs" in economic construction over the past 30 years have taught us a lesson that finance must vigorously exercise its role of regulating the proportion between accumulation and consumption, that there must be harmonious relationships within the national economy, and that financial income and disbursements must start with following the basic economic laws and strictly follow the objective quantity limits. All these constitute objective requirements which cannot be changed by man's wishes. Going against them will entail punishment.

Strengthening the Role of Finance in Appropriately Arranging the Proportionate Relationship Between Accumulation and Consumption

The role of finance in regulating the proportionate relationship between accumulation and consumption is determined by the objective character of socialist finance while the planning and arranging of financial income and disbursements in strict accordance with certain basic quantity limits are the objective demands of basic economic laws under socialism. However, neither objective laws nor objective demands can of themselves assert their role. All depends upon mankind in actual practice giving due recognition to their demands and scrupulously abiding by these objective quantity limits to the end that planning and arranging financial income and disbursements are strictly in accordance with objective demands. Only in this way can finance give full play to its active regulatory role of insuring that a correct proportion is formed between accumulation and consumption.

The prolonged disruptions caused by Lin Biao and the gang of four have brought much confusion to financial and economic administration. Many unsolved problems have been left behind. For example, there is no clear-cut demarcation of power and responsibility in financial and economic administration. Between the central government, the localities and the enterprises, there is much confusion in such matters as the centralization and division of power. Where power should be centralized it is not centralized and when it should be divided it is not divided. All these factors serously impede the correct exercise on the part of finance of its function of regulating the proportionate relationship between accumulation and consumption. At present, in order to strengthen the function of finance to effect a rational proportionate relationship between accumulation and consumption we must, in reforming financial and economic structure, give finance its proper place in economic administration, strengthen the responsibility of financial work, and correctly handle the questions of centralization of power and division of power in financial work.

First of all, the financial departments must be given the responsibility of realizing a correct proportionate relationship between accumulation and consumption. The fact that finance plays a decisive regulatory role over the proportionate relationship between accumulation and consumption objectively determines that departments handling financial work must shoulder this responsibility. Unfortunately, for a prolonged period of time, financial departments did not and could not take up this responsibility. But a fundamental measure to insure a harmonious relationship between accumulation and consumption in the national economy is to strengthen the responsibility of financial departments for correctly handling the proportionate relationship between accumulation and consumption. To enable the financial departments to take up this responsibility requires that they be given appropriate powers.

First of all, we must insure that financial departments have the power to determine what financial income should consist of and the power to reject requests to increase financial income which have no basis for support. If financial departments were forced to add, without any basis, to the income targets, then finance would be unable to shoulder this responsibility. Second, if in planning the disbursements finance is require to firmly insist on following the objective quantity limits, then it must possess the power to reject demands for investment that violate these objective limits. As for planning and arranging for production and construction and for distribution of material resources, financial departments should have the power to veto plans or arrangements that disrupt the normal proportion between accumulation and consumption. Only when their powers are not encroached upon can financial departments shoulder the responsibility of insuring the realization of a correct relationship between accumulation and consumption.

Next, we must strengthen the unification plan of finance and its efforts to achieve comprehensive equilibrium. The ratio of deployment of the national income between accumulation and consumption is an economic ratio vastly broad in scope. We must look at the task with a full perspective of the whole national economy and then work out a comprehensive plan. However, the distribution and redistribution of the national income, no matter whether it concerns organizing financial income or using financial funds, cannot be handled solely by the central financial authorities. Instead, local finance at various levels must be depended upon to contribute joint efforts. All activities concerning financial income and disbursements on the part of localities at various levels necessarily affect the proportion between accumulation and consumption in the national income. This requires finance to strengthen unified planning and to formulate a comprehensive financial plan so that under a unified plan, the income and disbursement activities of financial links at various levels may be coordinated to realize a rational proportionate relationship between accumulation and consumption.

PRC JOURNAL ON DISTRIBUTION ACCORDING TO WORK

HK290844 Beijing JINGJI YANJIU in Chinese No 11, 20 Nov 80 pp 54-58, 43

[Article by Wu Dingcheng [0702 7844 2052] of the Economic Institute of the Chinese Academy of Social Sciences: "Correctly Understand and Apply the Law of Distribution According To Work"]

[Text] In the articles "Several Problems Concerning Distribution According to Work" (GONGREN RIBAO 21 March 80 p 2) and "Preliminary Views on the Principle of Comprehensive Material Interests," (REMNIN RIBAO, 14 July 80, p 5) Comrade Jiang Yiwei puts forward some of his initial ideas on how to understand and implement correctly the principle of distribution according to work and on the reform of the wage and welfare system. [Hereafter all quotations without attributation are from these two articles] If it is considered necessary to implement comprehensively the principle of material interests, "we must let the masses of people see and feel both individual and overall material interests and see the direct relationship between individual and overall interests as when a boat goes up as the river rises." "We must let the broad masses of laboring people feel directly that individual interests depend on each individual's work ability and contribution and that they derive from the fruit of collective labor and also from the economic development of the country." Jiang Yiwei advocates that "under the socialist system, individual material interests of staff members and workers should come from three sources: the first is individual wages, the second is collective welfare services of enterprises, and the third is welfare services of society. For quite a long period of time to come, income from wages will still be the chief source of individual interests. But with the development of socialist construction, the proportion of collective and social welfare will increase day by day." These ideas are noteworthy, but some of the problems need further study. The following are some of my opinions which have not yet been considered thoroughly.

1. Is Marx's Tenet of Distribution According To Work Suitable for Large-Scale Production With Socialized Labor?

Comrade Jiang Yiwei holds that "in order to facilitate the explanation of the tenent of distribution according to work, Marx used simple commodity production as a format, whereas in our actual life, small-scale production based on individual labor no longer exists, and what we have is highly socialized large-scale production." We consider that Marx's scientific exposition on the tenet of distribution according to work was not based "on the format of simple commodity production" at all, but rather on socialized large-scale production. Marx said that during the stage of socialism, "the individual producer receives from society--after deductions have been made--exactly what he gives to it. What he has given to it is his individual quantum of labor.... He receives a certificate from society that he has furnished such and such an amount of labor (after deducting his labor for the common funds), and with this certificate he draws from the social stock of the means of consumption as much as the same amount of labor would cost. He gives to society in one form the same amount of labor he receives in another." ("Seclected Works of Marx and Engels," "Critique of the Gotha Program," vol 3, pp 10-11) Marx's exposition on distribution according to work is well-known to all. Is the economy in the socialist society mentioned here by Marx an economy of simple commodity production then? Not at all. Marx said, "Within the cooperative society based on common ownership of the means of production, the producers do not exchange their products, nor does the labor employed on the products appear here as the value of these products, as an objective quality possessed by them, since now, in contrast to capitalist society, individual labor exists in an indirect fashion but directly as a component part of total labor." (Ibid) Engels also made a similar exposition: "Once society possesses the means of production, commodity production will die out and so will the domination of products over producers. The situation of anarchism within social production will be replaced by planned and conscientious organization." ("Selected Works of Marx and Engels," "Anti-Duhring," vol 3, p 323) In other words, Marx and Engels, according to the situation of the economic development of the advanced--such as England, France and so on--capitalist countries in the 1970's of the 20th century, anticipated that the proletariat would first win a revolutionary victory in these countries and would construct socialism on the basis of a rather well-developed socialized labor and large-scale system of production. Thus, there is a marked difference between the socialism anticipated by Marx and Engels and the reality of our socialism. First, it has a unitary system of public ownership, whereas in our socialism, the system of ownership by the whole people and the system of ownership by the collective exist simultaneously, together with a small quantity of the system of individual ownership. Second, its social productive force reach quite a high level, whereas we are building socialism on the basis of a backward economy of a semicolonial and semifeudal society with a very low level of productive forces. Third, under the circumstance of a unitary public ownership and rather high level of productive forces, the relation between commodity and money dies out, the category of value no longer exists and the labor coupon becomes a common form of payment for labor, whereas it is still necessary for us to develop commodity production with great effort, to extend the circulation of commodities and to use monetary wages. To sum up, the socialist society anticipated by Marx and Engels has quite a well-developed, socialized labor, large-scale system of production and does not take simple commodity production as a format. On the contrary, in our present real-life situation, small-scale production based on the individual labor force makes up a certain proportion and the degree of the socialization of production is not high. Therefore, the belief that Marx's tenet of distribution according to work is based on simple commodity production, and that we already have a highly socialized labor, large-scale system of production, and that consequently, the thesis that "Marx's classical explanations of distribution according to work cannot be applied in practice in an oversimplified way," not only is not in conformity with out actual life today but also is not in conformity with the historical course of the idea of scientific socialism. First, the capitalism personally observed by Marx and Engels was still nonmonopoly capitalism. They explicitly pointed out that the basic contradiction of the capitalist society was the contradiction between socialization of production and private ownership, and consequently they scientifically foresaw that "when the concentration of the means of production and the socialization of labor reaches a stage which is incompatible with their capitalist shell, the shell will explode." (Das Kapital," People's Publishing House, 1974, pp 831-832) Thus, after winning the socialist revolutionary victory, the proletariat can, of course, only further develop the system of socialized labor, large-scale production on the original basis and cannot return to the small-scale production based on individual labor. How can it be imagined that Marx expounded the tenet of distribution according to work on the basis of simple commodity production? Second, Lenin and Stalin personally saw the development of capitalism from nonmonopoly capitalism into monopoly capitalism, that is, the stage of imperialism, in which production was highly concentrated and labor further socialized. However, Lenin summarized the tenet of distribution according to work as "Getting back an equal amount of product for an equal amount of labor," and realizing "equality in labor and equality in payment." Based on experience in socialist construction, Stalin further developed the tenet of distribution according to work into "from each according to his ability, to each according to his work." All this shows that Marx and Engels foresaw that the socialist society would be one with a socialized labor and large-scale system of production. Besides, Lenin and Stalin actually saw that the socialist society could only be one with a socialized labor and large-scale system of production. Proceeding from the prerequisite of socialized labor and large-scale system of production, they put forth that a producer's labor quantity and quality were taken as a standard for measuring the distribution of individual means of consumption.

Comrade Jiang Yiwei also holds that "Marx's explanations of distribution according to work can only be understood as a tenet and cannot be applied to practice in a simplistic way." As is mentioned above, Marx's scientific exposition on distribution according to work was put forward on the basis of a socialized labor and large-scale system of production in a socialist society and not on the basis of a simple commodity production. This being the case, Marx's classical explanation of the tenet of distribution according to work can certainly be applied in practice to socialist construction. In practice, many countries in which the proletariat have achieved victory through revolution have adopted various forms to implement the principle of "getting an equal amount of product for an equal amount of labor" and have been giving more to those who work more and conversely to those who work less. They have defended the personal interests of the laborers and aroused their enthusiasm in production. Deviation from this law will either give rise to equalitarianism or widen the gap between those who have more and those who have less in the distribution of the individual means of production, thus dampening the enthusiasm of the laborer and damaging the productive forces. There have been serious lessons in this respect both abroad and in China. Of course, in some departments and units, where the degree of socialization in production is comparatively high, there actually exists the situation where "within an enterprise, individual labor can only form a part of the product and individual labor can become effective labor only after the whole product is completed by the effort of all the laborers of the enterprise." Therefore, no one can say that a certain product is produced by "him." But from this we cannot draw the conclusion that since not any one of the products is produced by any individual producer, it is impossible to measure the amount of labor furnished by each producer, and "it is impossible to evaluate directly the individual labor contribution." If we say that because products are produced collectively, "it is impossible to evaluate directly the individual labor contribution," then, according to this logic, it is not only impossible to carry out business accounting in teams and groups and in workshops and to determine separately their collective contribution, but it is also impossible for enterprises which produce parts to carry out business accounting independently and to determine their own collective contribution. It follows that only enterprises which undertake to assemble and produce finished products can carry out business accounting independently and know their own collective contribution. If that is really true, the so-called "distribution according to work to be effected after distribution according to collective contribution of enterprises," and "distribution according to work within enterprises should also stress distribution according to labor contribution of small collectives," have all become unrealizable, empty words. Even if enterprises which produce finished products can calculate their own collective labor contribution, individual labor quantity cannot be determined. What then is to be used as a basis for measuring the distribution of individual means of consumption? I think that under the circumstance of socialized large-scale production, each product is the fruit of collective labor, and not the fruit of any individual's labor. This is a fact. However, through social practice it is still possible to determine the amount of labor furnished by each producer according to how he takes part in productive labor. The method of fixed labor quotas commonly adopted in different trades and professions is proof. As for producers working on a production line, it is difficult to calculate the number of products each of them produces. This only shows that the piecework wage system is not suitable for the fixed quota method. Even under these circumstances, time of labor, intensity of labor, degree of proficiency, safety operation, maintenance of equipment, cooperation and coordination, product quality, economization on materials and so on can be used to determine the amount of labor furnished to society by each individual producer, which serves as a basis for the distribution of individual means of consumption.

Again, Comrade Jiang Yiwei holds that under the existing conditions of commodity production and money circulation, "the contribution made to society by an enterprise as a whole can only be evaluated by the total value of the products it hands over to society. It is impossible to evaluate directly the labor contribution of an individual." Is this really so? Judging the intent of the statement, it really is like this. The products of an enterprise are produced by everyone together, and a sum of money is obtained after selling the products. It seems impossible to find out how much the labor contribution of one worker is. However, it is still possible to calculate the labor contribution of each producer if we strengthen enterprise management and fix properly the amount of staff and quotas, so that the output is counted, the quality is checked, the consumption has standards, the costs of production are calculated, the rate of attendance is recorded, the work is evaluated, the workpoints are allotted as in production teams, and comparisons are made between labor workpoints, total output value and net output value. This kind of calculation cannot be absolutely exact, but if we practice it continously and make summation and improvements continuously, we can calculate more exactly with each passing day the labor quantity of each individual producer.

Generally speaking, the Marxist tenet of distribution according to work is certainly applicable to a socialized labor and large-scale system of production. It is applicable when commodities and money still exist and it is also applicable after commodities and money have died out. That is to say, it is applicable throughout the whole historical stage of socialism.

2. What are the major problems in wage relations?

There are a lot of problems in our present wage system. What really are the major problems if our scope is confined to wage relations alone? We must make this point clear before we can suit the remedy to the ailment. It is necessary here to review history. After the wage reform in 1956, wages were adjusted a total of 4 times in the 21 years from 1956 to 1977. The shortest period between adjustments was 3 years and the longest 8 years, so the chances of promotion for staff members and workers were very few, resulting in the phenomenon of equalitarianism--having "several generations" of master workers and apprentices "in the same hall." Besides, differences in types of labor were over emphasized in the wage reform of 1956 so that the standard wages for some types of work in production were on the low side. For example, in industry, the wages of staff members and workers in some light industries were on the low side. Among industry, agriculture and commerce, the wages of staff members and workers of farms and commerce were on the low side. Between departments which produce materials and which do not produce materials, the wages of staff member and workers of the latter were on the low side. Between physical and intellectual workers, the wages of ordinary intellectual workers were on the low side. Among different regions, the wage grades of some regions also appeared to be slightly too low because of changes in the economic situation.

Let us look at the bonus system. It also has many problems. If, disregarding whether an enterprise has overfulfilled its production tasks and disregarding whether staff members and workers themselves have furnished extra labor, bonuses are distributed as a certain percentage of profits or of total wages and are distributed matter of factly month after month, with each person having a share, then they have actually become a form of supplementary wages. This phenomenon of equalitarianism is quite common. What is more, owing to various objective reasons, profits can vary among different enterprises. If bonuses are distributed according to profits before adjustments are made with regard to economic measures, the situation of having unequal shares of hard and easy jobs appear. Few institutions distribute bonuses. Schools usually do not distribute bonuses. Party organs, the government and the army do not distribute bonuses at all. Thus, differences emerge in material treatment given to staff members and workers of enterprises on the one hand and those of nonenterprise units on the other. These new situations have already attracted the attention of the people.

Generally speaking, equalitarianism exists quite commonly to varying degrees in standard wages within the same type of production work and in bonuses within the same enterprise. Some standard wages are on the low side for different types of production work and for different regions. Bonuses are distributed in different enterprises irrespective of the difficulty of the job. Unreasonable differences exist in the material treatment of staff members and workers of enterprises on the one hand and that of nonenterprise inits on the other. These are the major problems of the present system of wage relations. Only if these problems are studied in accordance with facts, if the law of distribution according to work is correctly applied and if feasible and reasonable measures are put forth can the enthusiasm of the broad masses of staff members and workers in the production system be brought into full play. Comrade Jiang Yiwei holds that "the first problem to solve should be indifference to good or bad work among different enterprises. Only then can the distribution problem within enterprises be solved.... If this problem of distribution according to work on a larger scale is not solved, and if distribution according to to work is carried out only for the individual within enterprises, then we are putting the cart before the horse." "If the problem of large-scale equalitarianism in enterprises is solved first, and if distribution according to work is carried out in smaller collectives within enterprises, where the result of labor or work can be calculated more easily, and equalitarianism among small collectives is overcome--if these two types of equalitarianism are overcome, then a small amount of equalitarianism within small collective will not affect the situation as a whole but will even do it good." We do not fully agree with this view. Indeed, the problem of equalitarianism among enterprises and among workshops is very serious and should be solved, but it is not part of the problem of distribution according to work. We will discuss it again later. As for the distribution of individual means of consumption, we consider that we must use labor as a measure and must deal with it according to the concrete situation in order to overcome equalitarianism. That "a small amount of equalitarianism will not affect the situation as a whole but will even do it good" is really difficult to understand. If such a path is followed, equalitarianism within enterprises will be moe serious and the phenomenon of distributing bonuses irrespective of the difficulty of the job will be even more conspicuous.

3. How to link material interests of staff members and workers with achievements of enterprise management?

Comrade Jiang Yiwei holds that "when we presently talk about distribution according to work, we often do not proceed from comprehensive material interests, leave out some links and merely talk about distribution according to individual labor ability and the amount of contribution. In theory it is defective and in practice it leads to laborers separating individual interests from collective interests and state interests and laborers paying attention only to individual material interests while ignoring the results of collective production and management or the economic development of the country." Here we must first make it clear as to when we talk about distribution according to work, are we "only paying attention to individual material interests"? We consider that: First, viewed from the distribution of individual means of consumption, to implement distribution according to work is to solve the problem of integrating labor quantity furnished by individuals with the amount of social payment, that is, to solve the problem of individual material interests. But viewed from the distribution of the total products of the society, the prerequisite of distribution according to work is the integration of the material interests of individuals, collectives and the state. It means that the distribution of individual means of consumption according to work is carried out after various deductions from the total products of society have been made. Therefore, distribution according to work follows the principle of integrating individual interests with overall interests and integrating immediate interests with long-term interests and is based on appropriately handling the relations of material interests among individuals, collectives and the state. It by no means causes people to care only about individual interests and immediate interests. Of course, in actual life the phenomenon of the so-called "paying attention only to individual material interests without paying attention to either results of collective production and management or the economic development of the country" does exist, but these are problems in actual work which need studying and solving. It is also proof of not correctly implementing the principle of distribution according to work and it is not a result of "merely talking about distribution according to individual labor ability and the amount of contribution."

Comrade Jiang Yiwei also holds that "if Marx's notion of distribution according to work is changed into: Each enterprise makes labor contribution to society, and, after various deductions, receives from society exactly what it has furnished to society, it then will suit the actual conditions of our country." As I understand it, this actually means direct distribution according to profits of enterprises. Will this really work? First, judging from the point of view of individual producers, if we say "distribution according to work should first be based on distribution according to collective contribution of enterprises," we are bound to give people a false impression: since everyone takes part in collective labor, everyone should have a share in the distribution, so it is reasonable to "eat in the canteen the same as everyone else" whereas it is groundless to deal with different people in different ways. Equalitarianism within enterprises will surely be encouraged and labor enthusiasm dampened. Second, judging from the point of view of enterprise profits, it outwardly is a complex reflection of the fruit of collective labor of enterprises but in reality it is related not only to individual labor and collective labor of the entire body of staff members and workers of respective enterprises but also to various objective factors. For example: 1) Though enterprises may have similar conditions, those better organized and with more advanced techniques and equipment make greater profits because of less material consumption, higher labor productivity and consequently lower production costs. These greater profits are the results of state investment. 2) Though mines and enterprises may have similar conditions, those with rich resources, mineral reserves of high grades and simpler operations, and farms with better climate and geology are bound to have more profits than their counterparts which do not. The extra profits are "differential income" which are derived from natural conditions. 3) Profits from exported commodities are usually more than those of commodities only sold on the domestic market. Profits of products for military use are usually more than those of products for civil use. Profits of high-grade products are usually more than those of low-grade products and so on. Such differences in profits are caused by differences in the processing structures of products. 4) Difference in external conditions such as transportation, supply and marketing also causes differences in profits. Under similar conditions, enterprises which have communication and transportation facilities, which have a regular supply of raw materials, fuel and power and which have unimpeded channels for selling their products are bound to have more profits. 5) The influence of higher or lower prices and of higher or lower tax rates over profits of enterprises is now especially obvious. Therefore, if wages of staff members and workers are decided in an oversimplified way, that is directly calcualted to the amount of each enterprise's profits, it will undoubtedly lead to enterprises unequally distributing the hard and easy jobs. This deviates from the basic requirements of distribution according to work. Third, judging from the point of view of the basics of political economy, what the central and local authorities receive all belongs to the category of "social deductions," and the portion from enterprise income used for the production fund, the reserve fund and the welfare fund also belong to "social deductions." Only the portion used for bonuses and annual dividends belongs to the category of distribution according to work. Comrade Jiang Yiwei holds that "distribution according to work by society to enterprises is chiefly reflected in distribution of total wages plus profits of enterprises." Hence the portion from enterprise income used for the production fund, the reserve fund and the welfare fund is also distribution according to work. This is worthy of further study and discussion.

From the three points mentioned above, to change Marx's distribution according to individual labor of producers in an oversimplified way into "distribution according to collective labor of enterprises," that is, direct distribution according to profits of enterprises, in theory, needs further study and discussion and in practice does not work. It will even bring about serious consequences.

How can material interests of staff members and workers be linked with achievements of enterprise management then? First, we consider that linking material interests of staff members and workers with achievements of enterprise management here does not mean fixing the wages of staff members and workers in an oversimplified way according to profits of enterprises but means using a portion deducted from enterprise income or profits for bonuses and collective welfare so that staff members and workers can see economic interests brought about by satisfactory individual labor and collective labor. In the future, when conditions are ripe, we can consider linking the range of promotion of staff members and workers or the level of their standard wages with achievements of enterprise management so as to further arouse the enthusiasm of staff members and workers to do a good job together in enterprise management and to raise the economic results. Second, to link material interests of staff members and workers with achievements of enterprise management, we must pay attention to solving the problem of unequal distribution of hard and easy jobs among enterprises. The thorough way to solve the problem of enterprises having unequal distribution of hard and easy jobs is to make use of such economic levers to adjust excess income brought about by various objective factors as collecting charges for using fixed assets and circulating funds, levying resources tax and income tax, adjusting prices of products, and reforming the tax system and so on, so that profits of enterprises can basically reflect the total fruit of individual labor and collective labor. If material interests of staff members and workers are linked with achievements of enterprise management on this basis, both the fundamental requirements of distribution according to work can be fulfilled and the problem of enterprises having unequal distribution of hard and easy jobs can be avoided. But at present, this cannot be done in one step. We can only adopt some transitional methods to carry out adjustment. For example, we can first affix the amount of bonuses to be set aside by deciding the percentage of bonuses in regard to total wages and then decide the percentage of such bonuses in regard to profits and finally in accordance with the potentials of different enterprises determine separately the percentage for setting aside bonuses according to profits of enterprises. In this way, although requirements for distribution according to work cannot be fully met, the problem of enterprises having unequal distribution of hard and easy jobs can be solved on the whole.

Moreover, Comrade Jiang Yiwei deems it "necessary to set the target for raising wage standards in the state plan for economic development. With the fulfillment of the plan for national economy, different grades of wage standards can be generally raised to a certain extent. In other words, if the actual ability of a staff member or a worker have not been raised and he cannot be promoted within a certain period, but his wage level can still be raised as a result of the development of state economy, it will then make him feel that individual interests are closely linked with the development of state economy." We consider that in principle it is absolutely correct to make staff members and workers see the direct relation between individual interests and the development of national economy. However, the way to realize this needs further study. 1) We must proceed from the actual conditions of our country and adopt practical and feasible measures. At present, there are numerous wage problems in our country and we simply do not have conditions for generally raising the wage standards. Therefore, the more practical and feasible steps should be: first matching wage grades with technical grades, technical titles and academic titles progressively so that wages of middle-aged staff members and workers can be raised more quickly. This leads to the realization of the principle of distribution according to work and arouses the enthusiasm of key vocational workers and at the same time solves the rather glaring problems in wages. It is like killing two birds with one stone. 2) Grant a certain amount of subsidies to staff members and workers in accordance with their length of service. This does not deviate from the principle of distribution according to work, and can also increase monetary wages of staff members and workers who have not been promoted for many years. It at least insures actual wages do not decrease. Of course, a certain material base must exist. We can only work to actively create conditions and gradually carry out this plan. 3) We should follow the principle that particular things develop with the improvement of the general situation, and adjust prices according to the situation of production and circulation. Monetary wages should also be adjusted to insure the actual income of staff members and workers does not decrease further so as to stabilize the livelihood of families of staff members and workers. This is an important problem concerning production, circulation and distribution and must be studied and solved as soon as possible. Finally, with the development of the national economy, collective and social welfare should be extended correspondingly so that the broad masses of staff members and workers can really feel that individual interests are closely linked to achievements resulting from enterprise management and the development of the national economy, and their initiative and enthusiasm in doing a good job in the four modernizations can be aroused.

To sum up, following Marx's tenet of distribution according to work, when we talk about more pay for more work, we do not mean to consider only individual interests but to take the integration of individual interests with collective interests and the integration of immediate interests with long-term interests as a prerequisite. When we talk about relating material interests of staff members and workers to achievements of enterprise management, we do not mean distribution according to profits of enterprises in an oversimplified way but to integrate appropriately material interests of staff members and workers with individual labor and collective labor and staff members and workers.

DEVELOPING COAL DRESSING, PROCESSING SAID IMPORTANT IN RESOURCE CONSERVATION

Beijing RENMIN RIBAO in Chinese 23 Oct 80 p 2

[Article by Hao Fengyin [6787 7364 0603], Deputy Chief, Production Division, Ministry of Coal Industry]

[Text] Editor's Note: Coal dressing is an indispensable link in coal production. Dressed coal and undressed coal are very different. Dressing can improve the quality of the coal, increase the varieties, raise the heat efficiency, and save on transportation. The gangue left from dressing may be used as low quality fuel and to manufacture cement. The rate of dressed coal in China is very low, always fluctuating at about 18 percent over nearly 20 years. It appears that coal dressing and processing should be emphasized and developed step by step in a planned manner.

China's energy utilization rate is very low. It is preliminarily estimated at 28 percent only, while the heat energy utilization rate of coal is below 25 percent. One of the reasons of this con dition is the low ratio of dressing. The quality of the products is poor, the varieties are few, and the utilization is not reasonable.

Dressed and Undressed Coal Are Not the Same

Dressing is an important measure to improve the quality of the coal products and to increase the varieties. The development of dressing and processing coal for reasonable utilization of the coal resources has important significance for the entire national economy. In some developed nations, the ratio of dressed coal is above 85 percent.

When raw coal is dressed, it is divided into different grades or varieties of different qualities to supply to different users. The economic efficiency of dressing may vary. First, it may effectively improve the burning efficiency to raise the heat energy utilization rate. Second, after dressing and processing the gangue and the ash of the raw coal are either eliminated or utilized locally. This fact alone may save more than 15 percent of coal transportation volume. Third, dressing may improve the value of coal products. Dressing may improve 30 percent of the value of coking coal and 20 percent of that of power coal. On the national average, the value of one ton of raw coal may increase 5 yuan. Fourth, the coal resources may be more fully utilized; the area of mining of low grade coal may be expanded and the ratio of mechanized mining may be raised. The gangue left from dressing may be processed into low quality fuel and construction materials. Due to these advantages of coal dressing, all countries of the world are trying to develop coal dressing and processing industries.

Slow Development of the Dressing Industry Has Unfavorable Effects on the National Economy

Since the establishment of the country, the ratio of coal dressing in China has been growing. At present, there are 102 coal dressing plants in the country, with a total capacity of 110 million tons. The growth of the ratio has been slow, however, and it has stayed at about 18 percent in nearly 20 years. Due to the slow growth of the dressing ratio and the imbalance between mining and dressing, the heavy burden is felt throughout the entire national economy, and manifested especially in the following four aspects:

(1) The ash content of coal is high and the varieties are few. At present, more than 80 percent of the users are using undressed and unprocessed coal with very low utilization rate of heat energy. The energy consumption for producing one ton of steel in China about doubles that in Japan and the poor quality of the coking coal is an important reason. The ash content of China's coking coal averages at 10.5 percent while it is generally 7-9 percent in foreign countries. The furnaces of the thermoelectric power stations should be supplied with pulverized coal but in fact most of them are provided with raw coal. The rate of coal consumption per kwh is about 50 percent higher than that in Japan.

(2) This fact increases ineffective transportation for the railways to cause the transportation situation to be more tense than it should. According to statistics, due to the fact that most of the commercial coal is undressed raw coal, the ash and gangue contents are high and they increase by about 30 million tons railway transportation volume every year.

(3) The waste of coal resources is serious. Only about 100 million tons of generally distributed coking coal is dressed every year, while more than 100 million tons of that is burned as power coal. Some varieties of Chinese coal having very high reputation on the international markets, such as the antracite of Yangquan, the raw coal of Taiyuan, the high adhesive coal of Fengfeng and Kailuan, etc. can compete very favorably, but due to lack of dressing process, 40 percent of these are burned as raw coal. If all these are dressed and processed, the quality of refined coal may be greatly improved (the equivalent of increasing the quantity of high grade coal). A condition may be created for the users to save energy resources and a portion of these may be exported to earn foreign exchange.

(4) Evironmental pollution is made to be more serious. It is estimated that when every 10 million tons of raw coal is burned, 2 million tons of coal ash, 300,000 tons of smoke dust, and 30,000 tons of sulfur dioxide are produced to cause serious pollution. If the cities burn dressed coal instead, the extent of pollution may be obviously reduced.

In the future, the degree of mechanization of coal mining will continuously increase and the condition of coal mining will worsen while the quality of the raw coal will also drop. If the ratio of dressing is not increased, by 1985, the ash content of raw coal may increase to 30-32 percent and the ash content of commercial coal will also raise to 26 percent. For this reason, more ways must be found concerning dressing and reasonable utilization, otherwise the problem of environmental pollution will necessarily become more severe.

Policy Must be Adjusted to Develop Dressing Processing

How can the coal dressing process be quickly developed to change the present condition of imbalance? First of all, in the idea of direction, the development of dressing process should be regarded as the important measure for opening the resources for energy conservation and for changing the structure of coal products. Second, coal products must be developed in the direction of improving the heat energy utilization rate, reducing environmental pollution, enhancing the advantage of coal, and guaranteeing export needs. At the same time, there should also be necessary reforms and adjustment in the existing management system and economic policy.

(1) The existing product planning, management, and quantity computation in mainly unit tons of raw coal should be changed. The production plan and inspection standard of state-operated coal enterprises use raw coal tonnage indices, and the various technical and economic indices, consumption limits, awards, and distributions are all tonnages of raw coal. The quality of the products and the number of varieties are not regarded as major inspection indices. For this reason, many coal mines give first consideration to the completion of the raw coal production plan. They are not willing to develop coal dressing. Some coal mines have dressing plants but are not using them. Although the quantity of raw coal production in China increases continuously, the ash content of the raw coal increases with it. The coal production of coal mines in 1965 was 170 million tons; it rose to 340 million tons in 1980, but the ash content of the raw coal also increased from 21 to 25 percent. Of the 170 tons of increased coal production, the ash increase factor took about 14 million tons. This type of emphasizing quantity of production but not the quality must be changed. In future management, the coal industry must use quality of the products and varieties of the coal as standards of inspection. In computation, China must be like the majority of the countries of the world, using standard coal or commercial coal as the unit of calculation, so that the plan management may be scientific while the coal mines may also be encouraged to develop dressing process to improve the composition of the coal products and to save the volume of transportation.

(2) The existing coal product distribution system should be changed. For a long time, coal has been managed in China as a general distribution material and not as a supplied merchandise. The existing coal products distribution system is very unreasonable. The producer, the transporter, the seller, and the user do not see one another. The production unit just produces; the distribution department only distributes in accordance with the production tonnage plan; the user cannot have direct link with the production unit and has no right of choosing products. Consequently, the product and variety are not fitting. What is supplied is not what is needed to create serious waste. Some local economic committees or related departments are afraid of dressing loss. The dressing process will affect the quantity of tonnage for distribution. After dressing, the superior quality products (with heat energy of 6,000-8,000 Cal) will be transferred out of the area and the by-products (with heat energy of 3,000-4,000 Cal) are retained for local use. For this reason, they cannot be positive about dressing. It is suggested that in the future, there should be unified management for production, supply, and sale. Under the unified plan, economic method is employed for scientific distribution to achieve high quality, multiple variety, individualized supply, and reasonable utilization. Different varieties are supplied to meet different needs of different

customers, so as to maximize the savings of the transportation capacity and improve the heat energy utilization rate of coal. The user and the production unit should sign contracts directly so that the supply will reach the designated areas and the quality will be stable.

(3) The existing pricing policy should be reformed. The existing price of coal products is generally too low, and the price difference between coal products is also not reasonable. This unreasonable policy should be changed to that of high price for superior quality and low price for inferior quality. The price should be determined according to the quality so as to encourage dressing. The function of pricing and taxing should be used to raise the tax rate of the raw coal and to limit the direct sale of raw coal for the purpose of encouraging the development of dressing processing.

(4) New techniques, new work processes, new equipment, should be adopted to establish a complete system of designing, researching, manufacturing, constructing, producing, and assembling industries. The present coal dressing procedure should be reconstructed to accelerate the design and construction of new plants. Scientific research of coal dressing should be strengthened as well as the leadership in developing, reforming, and reconstructing work. The development of coal dressing was not emphasized in the past. Most plants are using equipment and work procedure of the 50's so that the cost of constructing a coal dressing plant is high, the construction takes a long time, the work procedure of the plant is backward, the ash content of the products is high, the moisture content is great, and the environmental pollution is serious. In the future, the condition of a single product, such as the coking coal dressing plant produces only coking coal, must be changed. A system of capability of producing multiple products must be developed to grow in the direction of large size, high efficiency, and simplified plants.

As China's coal dressing engineering is backward, the mines are distributed in many areas and medium and small mines occupy a large ratio, attention must be given to develop practical dressing processes. The plant should be at a suitable site to achieve economic efficiency so that the user and the coal mine may both reap the benefit. Coal dressing plants of new mines and key old mines should be coordinated and expanded. For very old mines and small mines producing coal to be sold in nearby areas, moveable dressing plants may be developed or simplified technique of improving the quality of the coal may also be adopted.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Indexes to this report (by keyword, author, personal names, title and series) are available from Bell & Howell, Old Mansfield Road, Wooster, Ohio 44691.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

SPECIAL ECONOMIC ZONES DISCUSSED

HK270814 Beijing JINGJI YANJIU [ECONOMIC RESEARCH] in Chinese No 6, 20 Jun 81 pp 62-68

[Article by Tang Huai [0781 2037] of the Hong Kong and Macao Economic Research Center of the Economic Research Institute of the Chinese Academy of Social Sciences: "China's Special Economic Zones As Seen From Conditions in Export Processing Zones in the Developing Countries and Areas"]

[Text] Our country has decided to set up four special economic zones in Shenzhen, Zhuhai and Shantou of Guangdong Province and Xiamen of Fujian Province. Under the independent leadership and management of the government, these zones are providing a suitable investment environment and preferential conditions, to import and make use of foreign capital and technology in a bid to promote production, earn foreign exchange and serve the four modernizations. These zones represent a new form employed by a socialist country in making use of capitalism, and therefore during the early stage there have existed a number of problems that have to be studied and resolved. Fundamentally speaking, our special economic zones differ from the export processing zones or free trade zones set up by developing countries and regions. But they are similar with regard to earning foreign exchange by making use of foreign funds and developing their economy. This article deals with the experiences of the export processing zones or free trade zones set up by developing countries and region; proceeding from specific conditions of our special economic zones, it also probes several problems arising during the construction of our special economic zones.

I. The Historical Background and Major Problems in Developing Export Processing Zones

Export processing zones in some countries and regions began to emerge in the 1960's and they developed rapidly in the 1970's. In fact these zones followed the old track of the special economic zones set up in free-port areas. But the zones in different countries and regions differ in their business, with different names and management. The basic characteristics of these zones are that they are built in places with convenient communications and are usually not far from ports. Such zones provide various preferences for foreign investments in establishing processing industries with export-oriented products and in free trade and tourism. The purpose of these zones is to attract and make use of foreign capital and technology in developing industries so as to accumulate foreign exchange and provide employment. The preferences usually include free or lower import and other taxes, allowing transfer out of funds and profits, providing conveniences for visa and residence of foreign staff providing water, electricity, transportation and communications and related service trades and providing laborers.

In their economic war following World War II, the capitalist world mastered advanced product technology and equipment and cheap labor power. Compared with the price of labor power in advanced capitalist countries, wages in economically backward countries and regions are particularly low. Consequently, they have become sources for multinational and other international companies to plunder excessive profits, through producing commodities in such countries and regions by making use of cheap labor power and in particular by setting up labor-intensive processing industries. This is also the best way for such companies to squeeze out their competitors and win markets for their products. Take the production of electronic products for example. The reference materials of United in January 1975 showed that the annual production costs of 1 million radio sets in the Far East and Africa were respectively 230 percent and 240 percent lower than in Western Europe, and the labor portion of production costs used in Western Europe was 75.9 percent as against 63.8 and 51.7 percent respectively for the Far East and Africa. The annual production costs of 3 million electronic products in the Far East were 356 percent lower than in Western Europe and the labor costs in Western Europe were 483 percent more than in the Far East.

On the other hand, most of the economically backward countries and regions had very few or even no modern industry. They have to import industrial products for daily necessities. Such countries and regions are characterized by serious unemployment in both rural and urban areas, deficits in finance and foreign exchange and enormous foreign debts. In such an economic situation, they cannot but rely on foreign capital and technology to develop their economy, earn foreign exchange and expand employment. Consequently, the setting up of export processing zones has been regarded as an applicable form for making use of foreign capital and technology.

In short, most export processing zones have played their predicted role to different extents. Countries and regions with particularly backward economy have been able to considerably improve their national economy. But we cannot expect too much from the role of export processing zones or their ability to absorb foreign capital. Up to 1978, the workers of the 52 export processing zones (including free trade zones) of the 28 countries and regions totaled 474,000, with an average of only 9,100 workers per zone. The amount of investment in various zones was also not much.

The following are accumulated investments in major export processing zones in Asia (in $US millions)

Masan Free Trade Zone (South Korea, August 1975)	98.5
Kaohsiung, Nantzu and Taichung (Taiwan Province, December 1978)	175.9
Four Zones in Malaysia (1975)	123.6
Kartunzyak (Sri Lanka, November 1978)	74.5

With the exception of Egypt and Bataan in the Philippines, the figures for foreign investments in other zones are even lower.

Because different zones have made different achievements with different prices paid, and because of different degrees of utilization, limitation and reliance of foreign capital, different evaluation must consequently be made with regard to the gains and losses of different zones. In studying the nature, role and achievements of export processing zones it is imperative to pay attention to the following questions:

1. How to become gradually free from foreign capital.

The export processing zones in former colonies and tributaries have played a relatively great role in developing the economy. But these countries and regions have not been able to become independent of the former metropolitan states or U.S. capital and consequently there is no exception in the situation of the export processing zones in these places. The companies that have invested in bigger projects in these zones are multinational or international companies from the United States, Japan and Western Europe. The machinery, equipment, parts and raw materials are imported to these zones from companies in the United States, Japan and Western Europe or from their subsidiaries in other countries while the products are transported to the United States, Japan and Western Europe or dispersed in the markets opened up by the investors.

Therefore the main problem for these export processing zones is how to become independent of foreign capital.

2. We cannot expect too much from the role of export processing zones in promoting the industries of the countries or regions where they are located.

The processing industries in export processing zones are mainly labor-intensive light industries such as knitting, garment, shoe and hat industries, electronic and home appliances industries, plastics industry, industries producing daily necessities and the bicycle and motorcycle assembly industry. Some zones have tried to import medium or large production plants but they have made little achievements, with the exception of Bataan in the Philippines, which imported a processing plant of the Ford Motor Corporation and Penang in Malaysia, where a shipyard has been built. The reason for this is that medium and big industries require more investments, complicated equipment and technology and enormous transportation of raw materials and products. In addition, they require better facilities for transportation and water and electricity supply. Most export processing zones are not in the position to provide all these facilities. In addition, such industries require long construction and investment periods, with bigger investment risks. On the other hand, light, textile and processing industries require fewer investments, with shorter construction period and quicker capital turnover. These industries also require less laborers, with less risk and big profits. They also require less production technology and equipment; they import raw materials and semifinished products and export their products; therefore they do not have relations with the local industrial structure. That is to say, export processing zones do not have much effect in promoting the industrialization of the countries where they are located.

It must be pointed out here that countries and regions that have been producing, marketing and exporting their own light industrial and textile products in large quantities have, in order to protect the markets of their own products, taken measures to forbid foreign capital from taking advantage of cheap labor force in export processing zones and from taking advantage of preferences such as lower tax to produce the products that belong to the same categories or are similar of their own products. Such measures include limiting or forbidding investments.

3. The question of whether success depends on whether proper sites are selected for export processing zones.

The export processing zones that are in a position to attract foreign capital usually have the following economic conditions: First, they are able to provide better infrastructure such as ports, transportation, communications, electricity and water and services for daily life. Second, they are able to provide low labor costs, land rents and transportation costs and to provide more preferences, so that the products will have stronger competitiveness in international market. Third, they provide financial services directly linked with the international financial market which make transferring funds, credit and settlement of foreign exchange convenient. Fourth, they allow the setting up of enterprises with all the interest belonging to foreign capital. Fifth, they have high efficient administrative organizations. An increasing number of export processing zones has been set up in Asia, Africa and Central and South America. In their competition, these zones are providing the best possible preferential conditions and environment for investments. As a result, investors have more chance to select better zones. For example, a foreign enterprise set up in Bataan in the Philippines was originally intended to be built in another place in Southeast Asia, but comparison showed that Bataan was most suitable because it is convenient to use English language in the Philippines and because the company was permitted to market [figure indistinct] percent of its products in the locality and was granted a preferential loan. It is clear that export processing zones will have to pay a high price economically before they are able to attract foreign funds. If a zone is only able to attract few investments and fails to achieve the anticipated economic results, it will lose rather than gain. The export processing zones that have developed quite rapidly with certain achievements are those set up in trade ports that have better infrastructure and financial and trade industries. Capital construction in such zones requires less investment but yields quicker returns. On the other hand, Candara economic zone in India is backward economically, and has backward transportation and infrastructure. Consequently, this zone failed to attract foreign investments and make anticipated economic achievements. Some countries like Egypt welcome foreign companies to invest in any place in addition to export processing zones, with the same preferential treatment. Mauritius provides treatment similar to that of export processing zones to foreign companies investing in any place in the country. The whole area of traditional free trade ports such as Hong Kong and Singapore in fact provides favorable conditions for the export processing industry. Therefore, unspecified export processing zones or free trade zones are also in a position to import foreign capital in the form of setting up processing industries, compensation trade, and export processing industries jointly undertaken by both sides or totally invested in by foreign capital.

II. Some Problems in the Construction of Special Economic Zones in Our Country

1. What Kind of Special Economic Zones Should Be Built

Before a plan for a special economic zone is worked out. It is imperative to understand the relationship between the zone and the foreign investor in using each other for its own end. In order to make use of foreign capital, the zone must first of all create and provide proper conditions, but at the same time it must in no way spoil sovereignty and foreign trade. At the same time, the interest gained by this zone must exceed the price paid by the whole country, and not the price paid by a region or a unit. Foreign investors make use of this zone in order to get quite big profits. If the profits do not exceed or are even less than the profits in other places, they will not invest in this zone. Investments can be realized only when both sides make profits. Therefore, in deciding the form of a special economic zone, it is imperative to consider both necessity and feasibility.

The situation regarding communications, ports and industrial infrastructure of our four special economic zones differs very much from each other. Therefore we must put forward different demands on each zone according to its specific conditions and features, so that each will be able to display its advantages and avoid shortcomings. For example, let us probe the situation of Shenzhen special economic zone.

Bordering Kowloon, Shenzhen is a passage from the interior to Hong Kong and Kowloon, by railway and highway. There is a coastal area in Shenzhen, but it has no deepwater port. Exchanges of goods and people between Shenzhen and other countries all have to pass through Kowloon. Shenzhen urban area was formerly a small town, with an agricultural production region and an offshore fishing industry. Its existing infrastructure was not in a position to meet the needs in developing industry and commerce. The local residents have families or relatives working in Hong Kong or abroad, while the peasants and fishermen living in border areas can freely go to Hong Kong and Kowloon to sell their products. Consequently, their income and living standard are much higher than those in the interior. As some of the population have flowed out, there are not many young people and male laborers in this zone. So far no coal deposit has been found in Zhenzhen and there is little raw material for medium and big industries. Thus according to its natural conditions and social situation, there is no possibility for the region to develop big industry. But as the region borders Hong Kong and Kowloon, it is in a position to develop processing industry with export-oriented product. But compared with other cities of our coastal areas, Shenzhen is less advantageous in labor costs and industrial foundation. It is true that wages and land rents in Shenzhen are lower than in Hong Kong, but judged by its development, wages in Shenzhen will gradually increase because of various influences from Hong Kong. In addition, low wages do not necessarily mean low costs per unit. Take a garment factory for example. With similar equipment, a worker in Hong Kong produces several to 10 times more garments than his counterpart in Guangzhou, and the current situation in Shenzhen still differs very much from Hong Kong. Even if the labor cost per unit and the production costs in Shenzhen are only a little bit lower than Hong Kong, additional transshipment fees for transporting products to Hong Kong are needed as long as there are no roads for transporting goods directly to ports in Hong Kong and Kowloon for loading into vessels.

Labor costs in Shenzhen export processing zone must be compared not only with Hong Kong but also with other coastal cities in our country, as well as with other export processing zones and free trade zones in Southeast Asia and other parts of the world. Foreign businessmen will invest in Shenzhen only when it is more advantageous for them to do so than in other places. Labor costs in export processing zones in Southeast Asia are much lower than in Hong Kong. The following are average daily wages for manufacturing industry in export processing zones (excluding welfare, in U.S. dollars). (Figures from "Hong Kong Statistics Monthly," English edition, May 1980. Other figures were quoted from "The General Situation of the World Export Processing Zones"].

	Average	Unskilled worker	Skilled worker
The Philippines:			
Bataan (1978)	--	1.36	1.90
Malaysia:			
Penang (electronics industry, 1977)	--	1.42-2.84	1.90-3.80
Malacca (monthly wages, 1979)	62-71	--	--
Sri Lanka:			
(Kartunayak, 1979)	--	0.77	1.16
Hong Kong (September 1979)	8.11	--	—

It can be seen from our recent investigations of the average wage level in two units and the income of agricultural and sideline production in border areas in Shenzhen that: 1) monthly income of the most skilled woman worker of Nantou garment factory in 1980, when the piecework wage system was introduced, was 250 yuan. (Nantou garment factory is an enterprise with collective ownership and installed with foreign equipment; it is engaged in processing work.) 2) The new monthly wage standards that are defined by China Merchants Steam Navigation Company Limited for its industrial zone in Shekou are 108.1 yuan for a second-grade production worker, 140 yuan for a fourth-grade worker, 182.7 yuan for a sixth-grade worker and 240 yuan for an eighth-worker; 181 yuan for a 20th-grade administrative cadre, 275 yuan for the 16th grade, 357 yuan for the 14th grade and 504 yuan for the 10th grade. The income of laborers engaged in agricultural and sideline production is higher than that of workers, with daily income of about 4 to 10 yuan, and exceeding 10 yuan in a few cases. It is apparent that labor costs in Shenzhen are much higher than in other regions in our country, and also higher than most export processing zones in Southeast Asia. Labor costs are the biggest item in the costs of the labor-intensive processing industry; they are also the key factor for investors in selecting places for investments.

It must be pointed out here that of the items carried out in processing industry and compensation trade in Shenzhen, Guangzhou and other countries and people's communes in Guangdong Province over the past 2 years, most are labor-intensive items with products similar to our export-oriented products. From point of view of a county or commune, no doubt it has earned foreign exchange, provided employment and promoted economy; but at the same time it has weakened the competitiveness of our similar export-oriented commodities and harmed industry with similar products in other regions. To view this from the situation of the whole country, losses outweigh gains. Therefore it is necessary in future to proceed from the situation of the whole country and to define that our special economic zones must in no way process products from foreign companies at low cost when such products will seize the foreign markets of our products; but exception must be given to products that can be reexported from Hong Kong to overseas markets as quotas. In fact such a definition has long been practiced by export processing zones in other countries and regions.

Therefore we must not overestimate the ability of Shenzhen special economic zone in attracting foreign investments. However, Shenzhen has particularly advantageous conditions for developing tourism, retail shops, land and property development and agricultural and sideline production and fisheries for exports. In addition, Shenzhen borders Kowloon, and Hong Kong and Kowloon are tiny places full of buildings with one of the densest populations in the world. So when Shenzhen is able to afford conveniences to people and allows vehicles from Hong Kong and Kowloon to enter (for example, holders of Hong Kong identity cards and driving licenses can come in and out at any time), exempt import and export commodities from tax, add more facilities for tourism, recreation and sports, run well service trades and improve environment and hygiene, it will consequently be able to attract more tourists from Hong Kong, Kowloon and other countries. Official statistics show that the population of Hong Kong and Kowloon is more than 5 million and the number of tourists visiting Hong Kong over the past few years was more than 2.2 million, making a total of 7 to 8 million. Suppose that an average of 20 percent of these people visit Shenzhen once a year, it means about 1.5 million will tour Shenzhen. In fact, every weekend and holiday, the streets in Shenzhen are crowded with several hundred thousand tourists a day. Shenzhen is now undergoing construction. Therefore once its conditions are improved, Shenzhen no doubt will be able to attract more tourists. While developing its tourist industry, it is also necessary for Shenzhen to set up shopping centers for selling agricultural and sideline products and industrial products for daily use. These centers may also sell imported commodities with retail prices lower than Hong Kong because thanks to tax-free imports, wages, shop rents and management fees for warehouses and others in Shenzhen will be lower than in Hong Kong. This means that with shopping centers where quality commodities are available at low prices, Shenzhen will be able to attract more tourists. Take tourism in Hong Kong for example. Many tourists come to Hong Kong for shopping. (As Hong Kong is a free trade port with imported goods exempt from tax, sale prices of commodities in Hong Kong are lower than those in the places of origin of these products; therefore tourists often purchase commodities in Hong Kong that are made in their own countries. Many tourists from Japan and Southeast Asia come specially to Hong Kong to purchase wedding clothes and jewelery. In the first 6 months of 1979, tourists coming to Hong Kong spent 67.5 percent of their total consumption in shopping. But as Shenzhen now lacks commercial management staff and is not familiar yet with channels for selling commodities, it can only take the form of joint ventures with foreign businessmen for a certain period.) Shenzhen may also supply vegetables, dairy products, poultry, fresh water fish and garden products to Hong Kong. There are also good prospects for building (certain sections of land in the Luohu area, Shenzhen, have all been purchased by Hong Kong developers and the buildings are now under construction) that can be sold and leased to overseas Chinese and Hong Kong and Kowloon compatriots. Developing tourism and setting up shopping arcades require less investments than infrastructure in establishing industrial zones; they can be built in a shorter period with quicker turnover and they earn more foreign exchange. Probably it is better for Shenzhen special zone to develop tourism and build shopping arcades as the key, and at the same time to develop beneficial industry, commerce, agriculture, animal husbandry and fisheries, rather than develop processing industry with products for export as the key. This is the way to display advantages and avoid shortcomings.

The three other special economic zones must work out their planning according to their specific conditions. Zhuhai zone, for example, has good beaches for attracting tourists and it has resources in agriculture, animal husbandry and fisheries for exports. Therefore this zone may develop these two aspects and develop small processing industries for exports that do not require much energy and transportation.

2. The question of currency in special zones.

The question of currency in special economic zones includes two aspects. On the one hand, it is necessary to create conditions for foreign funds so that they will be able to link with the international money market. Modern capitalist industry and commerce will not exist without financial business such as credit, settlement of accounts and foreign exchange. There are three ways of solving this problem. First, to allow foreign banks to set up branches in special zones. Second, to allow foreign capitalized enterprises in the zones to have direct business relations with the Hong Kong money market (including banks, finance companies, insurance companies, trust companies and commodity and stock exchange markets). Third, to let the Bank of China act as agent for international financial business and handle the foreign currency deposits. We must choose the form that is most favourable to our country.

Another question is the currency in Shenzhen special zone. In addition to renminbi and foreign exchange certificates (various sectors hold different views whether foreign exchange certificates are currency, but under certain conditions they play part of the function of currency) there are also foreign currencies (mainly Hong Kong dollars) that are being illegally used. This situation has caused various defects. How can we solve this problem? One idea is to issue special zone currency as the sole form circulation within the special zone. The average exchange rate of this special zone currency against foreign currencies will be adjusted basically according to the exchange rate of purchasing power, so that the legal average price will basically accord with free exchange rate. There is no precedence in other export processing zones for issuing special zone currency. It sabotages the unity of the state currency, has a bad political influence, and makes it difficult to maintain a stable value. If the rate between renminbi and special zone [words indistinct] there is no difference between the latter and foreign exchange certificates, and the only difference is in the range of circulation. If the rate between the two fluctuates, the renminbi will have two different exchange rates, against special zone currency and against foreign exchange rate in other places of the country. Consequently, the exchange rate between the renminbi, special zone currency and foreign currencies will become very complicated to encourage illegal activities such as smuggling and arbitrage.

Another idea is to adjust the current non-trading exchange rate of the renminbi so that this rate will be near to the exchange rate of purchasing power while foreign exchange certificates will cease their function. The renminbi should be the only means of circulation in special economic zones and other places of the country. The current non-trade foreign exchange rate differs so much from the exchange rate of purchasing power that measures have been taken to compensate for exchange rate for exported commodities. As a result, Hong Kong and Macao citizens and overseas Chinese would usually spare no efforts to bring commodities with them when coming to China for resale, and they do not want to remit money; tourists have found that their costs for daily necessities in China are too high when calculated in foreign currencies, and people have found it beneficial to engage in smuggling and arbitrage; such activities are difficult to check even when strict penalties are imposed. As our foreign trade system is being readjusted, the control over direct exports by various regions and departments has been relaxed. With increasing numbers of overseas Chinese and compatriots from Hong Kong, Macao and Taiwan coming to visit their families in China, it is imperative to develop tourism in a big way. In addition, foreign funds are being imported in various forms, our special economic zones are being expanded and our government has joined the IMF. All this shows that our economic relations with other countries [word indistinct] from the past in both breadth and depth. If we continue with our present exchange rate that goes against the law of value, a series of problems will inevitably crop up and these problems will cause unfavorable results to our foreign trade, industries that produce for export, tourism, remittance from overseas Chinese, foreign exchange and import and export management, while the problem of currency in special zones will become even more outstanding. We will not be able to solve these problems if we just treat the symptoms, not the disease. This is also the case with problems of foreign exchange certificates. If the exchange rate is readjusted according to the exchange rate of purchasing power, the above problems will automatically adjust and improve themselves through the law of value, and this method is feasible for solving the currency problems in special zones.

Of course preparations must be made before the average rate is readjusted according to the exchange rate of purchasing power. For example, in defining the exchange rate of purchasing power it is imperative to carry out all-round investigations and study. Prices of goods in international markets fluctuate around production value, while different countries have different market value for various reasons. Therefore it is a complicated question how to get average market value. The local prices of goods in our country include planned prices and nonplanned prices and the former often accord with production value. Therefore what local market value should be compared with international market value is a very complicated problem. It is also imperative for us to gradually probe into and solve this problem.

3. Import foreign capital selectively.

As export processing zones in some countries and regions depend on foreign capital and the foreign capital in such zones is mainly invested in the light, textile and assembly industries, it is imperative for such zones to pay attention to importing capital selectively. First of all, the sources of foreign capital must be diversified as much as possible so that special economic zones will not fall under the control of a few multinational or international companies. In particular, special attention must be paid when we are importing capital from overseas Chinese and compatriots from Hong Kong and Macao who have quite strong economic power. A considerable amount of this floating capital is now seeking places for investment. In addition, funds from overseas Chinese and compatriots in Hong Kong and Macao are medium and small funds that are being squeezed out by big foreign capital, and consequently they are seeking new places for investment. In particular, the structure of the Hong Kong economy is now in a period of transition. Labor-intensive industries that progressed rapidly in the 1960's and 1970's such as the garment industry, plastic flowers industry and toy industry have gradually lost their competitiveness in the international market because the growth of labor costs and land rents in Hong Kong has surpassed that in neighboring regions, except Japan, while production costs have also increased. Therefore the capital in these sectors is being invested in trades with intensive capital and labor, or diverted to other regions where labor costs are lower. It is estimated that the investment diverted to other regions (mostly Southeast Asia) over the past few years totaled as much as $10 to $15 billion. A Hong Kong economy of this type gives us chances to make use of Hong Kong capital. Second, most overseas Chinese and Hong Kong and Macao compatriots love their country and they have countless ties with China. Under specific conditions, they are more willing to invest in China than foreign capital. In addition, they are also more willing to cooperate. Third, in special zones, industries such as the light, textile and processing industries, tourist facilities, foodstuff production, agriculture, sideline production and fisheries are more attractive to foreign capital. These trades require less investment, not high technology, and they are within the capability of medium and small capital from overseas Chinese and Hong Kong and Macao compatriots. Therefore, in order to encourage overseas Chinese and Hong Kong and Macao compatriots to invest, it is imperative to work out investment regulations with more preferences. Various forms of joint ventures must be introduced to attract foreign capital. For export processing industries, to import capital is not only a matter of using this capital but also a matter of making use of the business management and sales channels of foreign businessmen. But in the case of enterprises with foreign investment and processing enterprises, sales markets are in the hands of foreign businessmen themselves and it is beyond our reach to grasp the situation of these markets. Therefore, once foreign businessmen terminate their contracts we can in no way succeed them; but such a situation will not happen in the case of joint ventures. In addition, the enterprises with foreign capital must use our raw materials and intermediate products as far as possible. This practice will not only increase our production in prices of products and create more foreign exchange but will also decrease control over raw materials and intermediate products by foreign capital.

4. Leadership and management over special economic zones.

The export processing zones in a number of counties and regions are under unified leadership of the central government. The departments concerned send their experienced and capable cadres to form management organizations, work concentratedly, simplify administration procedures and improve efficiency. It is necessary for our special zones to be put under unified leadership. Such a measure is needed because special zones are related to foreign affairs politically and economically, and they are characterized by strong policy nature. Following their development in future, these zones will have to do business with richly experienced international consortia and multinational companies that have formed their own international networks for the production and sales of certain commodities through parent companies and subsidiaries. On the other hand, our country has for a long time studied very little and consequently understands very little about capitalist industry and commerce and international markets. In addition, our special zones have relations with various departments of our country. Therefore, without unified leadership and management, each zone will carry out work in its own way, and consequently they will not be able to coordinate and carry out their work according to the special conditions of special zones. Thus the best way is for the central authorities to set up or empower an organization to exercise unified leadership, work out policies and coordinate the work between special zones and various departments and regions. Under the unified leadership of the central authorities, each special zone must set up its own management organization composed of cadres who are familiar with policies and business and who come from various departments of foreign trade, customs, banks, border defense, labor, industry, commerce and administration. This organization will manage in a unified and centralized way the business of various departments concerned with the zone, and will not implement in the zone policies and laws that do not accord with it.

All the business departments set up or invested in special zones by the industrial and commercial departments of the central authorities and various provinces and municipalities must come under the management of the special zone management organizations. All their business operations, suspensions, items of business and imports of foreign capital must be checked and approved by special zones, which have the right to suspend and correct any policy that does not accord with their situations.

In addition to setting up administrative management organizations, special zones must also set up investment and construction companies to be responsible for organizing and managing the infrastructure, tourist facilities and facilities for daily life and for leasing out standard plants and residential buildings. The sources of investments may be imported or may come from bank loans. The items of investment must be able to recover the capital invested and make profits in a predictable period.

It is hoped that the above-mentioned views will be discussed by the comrades who are interested in the economic theory and practice in special zones.

'JINGJI GUANLI' ON LESSONS FROM IMPORTING EQUIPMENT

HK301356 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 6, 15 Jun 81 pp 12-14

[Economic commentary by Lin Senmu [2651 2773 2606]: "Lessons Drawn From the Importation of 22 Complete Sets of Equipment"; passages within slantlines published in boldface]

[Text] After the smashing of the "gang of four," the party Central Committee made a decision to expedite the pace of our socialist modernization program with the utilization of foreign funds and technology. Practice has fully proven this to be entirely correct. But it must be acknowledged that there cropped up some shortcomings and mistakes in the process of implementing this correct policy decision. The importation of the 22 projects of complete sets of equipment signed in 1978 was a prominent instance. This batch of projects was the product of "leftist" mistakes, and was a product of not seeking truth from facts, and of subjectivism.

In the 10 chaotic years, our national economy was brought to the brink of collapse, the disproportionate relations of the national economy were very serious, the scope of capital construction was overstretched and the orientation of investment was irrational. Normally speaking, after the smashing of the "gang of four," we should have carried out readjustment and rectification and let the people rest and build strength, instead, we called for "getting going and going all out" and building 120 large-scale backbone projects, and the total amount of investment within 8 years (from 1979 to 1985) was planned to exceed the total sum of the past 28 years. Under the guidance of this "theory of achieving quick results," an upsurge of importing complete sets of equipment was started. In 1979 in a very short period of time, large numbers of contracts to import foreign equipment based mainly on the 22 projects were signed. This included the contracts comprising about half of the total amount of transactions which were signed within 10 days beginning from 20 December 1978 to the end of that year. Many of them were projects outside the state plan. The Shanghai Baoshan Iron and Steel General Plant, the biggest project ever seen to date, was also a project outside the state plan. On the issue of importing these projects, no procedure of construction was followed, neither were any earnest investigation and study nor technical and economic deliberation and comparison of various plans made, and also no overall balance was made through the planning departments. Everything in this respect was decided by the leading cadres by marking dots and small circles. Even without the simplest certificates for planned tasks but only based on a scrap of note paper with some dots and ring marks, they could sign more than US$2 billion worth of contracts with foreign businessmen and decide on construction projects with a total investment of 10 billion [presumably yuan]. Therefore, the importation of these 22 projects was made largely at random and in a blind way. The large quantity of foreign exchange used and investment poured into these projects could only help make the imbalances of the national economy worse.

/1) Making the scope of capital construction become viciously inflated./ The long-drawn-out situation in which the scope of our national economy was overstretched, the management was in disorder and the investment effects were poor has remained unsolved for a long time. Although these 22 imported projects were small in number, the investment channelled into them was substantial. This made the already overstretched scope of capital construction continue to expand. It will take 7 or 8 years to fulfill the volume of investment needed by the planned large and medium-scale projects which have not been completed, calculated on the basis of their original level of investment of that year, even without any new projects being set up. The 22 imported projects (excluding the accumulative total of fulfilled volume) occupied 34 percent of the total investment needed. According to their original plans, the investment in these imported projects will reach a climax in 1980 and 1981, each year needing 10 or 20 billion yuan of investment, surpassing the limit of the national financial strength and material resources. In fact, to make this batch of projects form comprehensive productive forces requires the building of additional necessary complete sets of projects such as railway and power stations, and transforming electrical transmission lines, coal cleaning plants and projects for the production of industrial chemicals, and the corresponding urban construction. It was estimated that the actual scope of the 22 imported projects plus their necessary complete sets of projects would be 100 percent greater than the planned scope. This will greatly surpass the actual abilities of our national strength.

/2) The orientation of investment is irrational./ In China's distribution of investment in capital construction there has existed a tendency in which heavy industry is given one-sided stress while light industry does not receive the deserved attention, resulting in a very irrational economic structure. Because of the one-sided priority given to the development of heavy industry and the overly low proportion of investment in agriculture and light industry, agriculture and light industry could not develop in a proper way. In the inner sectors of heavy industry, owing to the practice of "taking steel as the key link," the basic structure such as the energy industry and transport and communications have become the weak links. With the backward state of energy and transport and communications, only 20 to 30 percent of the industrial productive forces could be utilized, and many enterprises stopped production for 3 days and operated for 4 days, and vice versa. Therefore, it is necessary to readjust this irrational orientation of investment and rationalize the economic structure. However, among the 22 imported projects signed in 1978, the main projects were metallurgical and chemical industrial projects comprising 74 percent of the total volume of investment in this batch of projects, energy projects constituting only 11 percent and light industrial and textile industrial projects occupying only 12 percent. As a result, the orientation of investment has become more and more irrational.

The total volume of investment needed by the unfinished projects of the planned large and medium-scale projects which were under construction centered on heavy industry, particularly the metallurgical industry comprising 22 percent of the total volume of investment needed by the unfinished projects and the chemical industrial projects constituting 10.6 percent.

/3) Without the conditions for production being practicable, even though the items are completed, they still cannot go into operation./ Most of the 22 imported projects consume large quantities of energy. After going into operation, they will annually consume 10 million tons of crude oil and 20 million tons of coal. In the present situation in which our energy supply is strained, the state cannot afford to supply. Take a copper-producing basic construction project for instance. If its conditions for coal, electricity and transport and communications are unpracticable, it will annually consume 1 or 2 million tons of coal according to the originally planned scope. This will affect the newly built power plants and the balance between production and demand of coal, and coal should be imported from other areas, which in turn will add weight to the overloaded railway transport, thus demanding additional railways to be built or rebuilt. Some chemical industrial projects still do not know where to get crude oil from. In addition, several other projects will encounter the problem of energy supply of raw materials after completion.

In sum, the problems of the construction of the 22 imported projects were relatively many. Therefore some of them got stranded before going into operation; many projects which have been put into construction had to be cancelled or postponed and still others whose construction plans should be altered and scale should be reduced. In this way, warehouses had to be constructed to store the several billion U.S. dollars' worth of equipment, consuming a large amount of manpower, materials and finances to preserve and take care of them, resulting in several billion [currency unspecified] units of foreign exchange or scores of billion renminbi lying idle over a long period of time. This was unprecedented in terms of politics and economics.

At present, the primary task for clearing away and ridding ourselves of the "left" deviationist ideological shackles in economic work and further implementing the principle of readjustment of the national economy is the further curtailment of capital construction to a proper degree. In the meantime, it is imperative to earnestly sum up and draw lessons from these 22 imported projects.

/1. Borrowing from abroad to buy mechanical equipment depends on the amount of national funds necessary to manufacture complete sets of equipment./ Under the prerequisite of putting self-reliance first, it is entirely necessary to borrow from abroad to import some advanced techniques. This is conducive to counteracting our weaknesses in construction funds to speedily enlarge the productive forces and utilizing advanced technology to transform the national economy. But most of the foreign debts we borrowed 2 years ago were used to buy mechanical equipment. Using foreign debts to buy mechanical equipment does not depend on our subjective will but depends on how much investment the state can afford for the necessary complete sets of equipment. The ability to manufacture the necessary complete sets of equipment should be considered in two ways: one is the national investment, materials for equipment and ability to construct needed by the projects to manufacture the necessary complete sets of equipment, and the other is the ability to form complete sets of raw materials, fuel, power and transport and communications after the projects have been constructed.

Some people once argued that it was permissible to separate the carrying out of capital construction using equipment bought with foreign debts from the domestic planned arrangements, thus allowing it to go its own way, that is to say, it could be disconnected with the domestic state plans or finance. This "theory of disconnection" does not hold water. Take the first phase of the project of the Shanghai Petrochemical Industrial General Plant, which has been completed and put into operation for example. This project has 18 sets of equipment in all, of which 9 sets were introduced from abroad and 9 others are Chinese-made. The public facilities, municipal administrative facilities and nonproductive construction were all supplied domestically. Viewed from the angle of the ratio of investment, the imported installations comprised 37 percent while the Chinese-made ones constituted 63 percent. If the portion of the 9 Chinese-made installations had been imported from abroad, we should have spent more foreign exchange. Meanwhile, the domestic productive capacity of these projects cannot be utilized. This is economically irrational. If we build by means of borrowing from abroad the public facilities (heat and power stations, water works, railways, roads and docks) and import all power-generating equipment, rail sleepers and locomotives, this seems to be disconnected, but where should we get the needed rolled steel, timber and cement from? Apart from the bricks, tiles, lime, sand and stones which should be taken from the domestic market, it is almost impossible to rely on foreign countries to supply cement, electricity, coal and transport and communications facilities needed by the construction. The nonproductive construction (housing, canteens, shops and hospitals) and the construction of water supply, sewage, gas, telephone and transport facilities which serve factories also cannot be solved by borrowing from abroad. In addition, taking production into consideration, even if we borrow from abroad by processing supplied materials, assembling supplied parts and importing assembly lines, and pay them with products exported, we still require domestic replenishment of complementary materials, packaging materials, necessary complete sets of equipment and the relevant funds. How can the large-scale imported projects be disconnected with the domestic appropriate ones? Needless to say, no matter what means and measures we take in borrowing from abroad to undertake construction, it is necessary for agriculture and light industry to provide us with the means of livelihood. Borrowing from abroad to undertake production should be based on the substantially increased production of agriculture and light industry. The disconnection of arrangements between construction using borrowed foreign funds and production by domestic strength, in fact, is to be divorced from the overall balance of the whole national economy, starting to build all over again. This will inevitably lead to loss of control over the scope of capital construction and damage the proportionate relations of the national economy.

Therefore, in borrowing from abroad to import some projects, it is necessary to make an overall plan and link up the interior and the exterior to attain overall balance. As regards all projects using foreign investment, it is essential first of all to consider the degree of capability and possibility to cooperate and manufacture the necessary complete sets of equipment domestically. It is not permissible to decide in isolation on the scale, schedule and effects of the imported projects regardless of the conditions for the construction of projects to manufacture necessary complete sets of equipment and the possibility for cooperation of building times and conditions for construction. The imported projects and the projects for the necessary complete sets of equipment should be arranged well concurrently, otherwise even when they are completed, they will not produce any practical results and on the contrary, they will become a heavy burden.

/2. It is necessary to proceed from the national condition and increase the capability for self-reliance./ The aim of importing technology by using foreign investment is to increase our capability for self-reliance. We should rely on our own strength in building the four modernizations and not buy modernization. In using foreign debts, we should not import any projects whatsoever production. Particular stress should be laid on introducing advanced technology and trying in every possible way to increase the domestic level of designed capacity and manufacturing capability. Everyone should take the overall interests into consideration and energetically foster the domestic manufacturing industry. It is not permissible to weaken and attack the domestic engineering (manufacturing) industry. Hence the domestic departments concerned should be allowed to undertake every design that can be undertaken or mastered through learning at home. Equipment that can be manufactured and supplied at home should be supplied as much as possible by the departments concerned at home. As for some equipment that cannot be supplied at home for the time being, it is permissible to introduce from abroad the blueprints (drawings) and technical data, and engage foreign specialists as instructors. We should try our best to manufacture them by ourselves. In case we are obliged to buy equipment from abroad, we should buy the key equipment.

Furthermore, in importing advanced technology, we should take our own actual conditions and the current national ability and resources into consideration. Our country has limited funds, insufficient technological force and a large population. Therefore in carrying out modernization, we have to consider what is to be modernized first and what later, proceed on the priority principle, make rational arrangements, differentiate what is primary from what is secondary and distinguish between what should come first and what should come later. Whenever modernization is mentioned, people think that everything can be accomplished by "pressing a button." It is unnecessary and impossible to do things like that. In our country, advanced and relatively backward techniques will exist concurrently. Therefore, it is necessary to spontaneously develop automation, semiautomation, mechanization, semimechanization and manual labor of various types.

/3. Decisions on every project should be based on scientific confirmation and technological and economic deliberation./ In deciding on every imported project, we should act according to the procedure of capital construction and the scientific laws and correct the unhealthy tendencies of writing instructions or notes arbitrarily and starting projects in an unplanned way. Without the examination of comprehensive departments concerned and approval through collective discussion, no one, from secretaries of the people's communes to members of the Standing Committee of the CCP has the right to ratify any projects.

An earnest technical and economic deliberation (feasibility study) should be made before importing a project, including the main problems of the research projects such as resources, (?geology), raw materials, fuel, power, communications, technological processes, equipment selection, product specifications, varieties, quantity and market. We should conduct technological and economic investigation and study of the project, make a comparison of the various plans and calculate the technical and economic results after it is completed. Only after this project has been proved to be technically advanced and reliable, economically beneficial and profitable, and in addition, we are capable of undertaking it, can we begin to carry out trade negotiations and sign contracts for imports. Without making any scientific confirmation and without any analysis of technological feasibility or economic feasibility with regard to the imported projects, we decided on them after making assumptions by marking only a few dots and small circles on a piece of paper. We "did not have a real understanding of how things stand but had great determination and lots of measures." This practice of blindly deciding on projects to be imported will inevitably cause great waste and inflict many hidden dangers and insurmountable incurable diseases on production.

/4. Learn to do business./ Over the past 20 years, blocked by imperialism in the first stage and disrupted and sabotaged by Lin Biao and the "gang of four" later, it was impossible for us to develop economic activities with other countries on an intensive scale. As a result, we have a poor understanding of international economic activities and little knowledge in many respects. Owing to lack of experience, the importation of the 22 projects was a bit too hasty, hence we suffered some losses. We must learn to do business and master the knack of doing business.

In negotiating loans to import technology, we have come into contact with many foreign capitalists. We should soberly realize that foreign capitalists are after all capitalists, and are "the personification of capital" (quotation from Marx). Their motives and aim for doing business are to achieve the biggest profits. The profits they aim to obtain definitely cannot be less than the average international profit rate. If the profits they gain are less than the average profit rate, they will not take risks to make investments and they are entirely justified in keeping their money in banks to receive interest safely and surely. In talking about the role of gold under the socialist system, Lenin pointed out: "After winning international victory, I think, we will build some lavatories with gold in the streets of the several biggest cities in the world." But at present, we "must still treasure gold. If you sell your gold, sell it at a higher price, and if you buy any commodities with gold, buy them at a lower price. If you live with wolves, you should learn to bark like wolves."

Promptly summing up experience, upholding what is correct and correcting what is wrong are our fine traditions and also the main reasons for the progress we have made in our work. We should uphold our fine traditions and do a proper job in using foreign investments to import technology.

'JINGJI GUANLI' PROBES ECONOMIC REFORM IN SICHUAN

HK291450 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 6, 15 Jun 81 pp 16-23, 26

[Article by Lin Ling [2651 0407] of the Sichuan Provincial Social Sciences Research Institute: "Experiences and Problems Concerning Reform of the Economic Systems in Sichuan Province Over the Past 2 Years"]

[Text] I. Developments in Reforming Economic Systems in Sichuan Over the Past 2 Years

In Sichuan, experiments in reforming economic systems have been conducted under the guidance of principles established at the 3d Plenary Session of the 11th party Central Committee. Over the past 2 years, the people and the authorities at all levels in the province have exerted joint efforts, and the reform has greatly developed both in scope and in depth. Judging from its scope, the experimental reform has been extended from industry to agriculture, commerce, the handling of goods and materials, public finance, planning, pricing of commodities, banking, construction and other economic sectors. It involves the realms of production, circulation, distribution, consumption and so on. Judging from its depth, experimental reform has affected not only the whole economic realm, but also the superstructure and ideology. It has been transforming a series of traditional ideas that have been formed over many years. In this sense, our reform of the economic systems is really a profound and major socio-economic change. Therefore, we have strong confidence in this reform.

The reform in Sichuan involves many issues. We will now examine several major ones.

(1) Expanding Enterprise Autonomy

This is the point which we proceed from and base ourselves on in reforming our economic systems, whose gravest weaknesses are: first, power is overly centralized, so that the enterprises are rigidly fettered; and second, "eating out of a big pot" has made the enterprises and workers lazy. To reform our systems, we must proceed from increasing enterprise autonomy and fully mobilizing the enthusiasm of the enterprises and workers. Over the past 2 years, starting from increasing the autonomy of a minority of enterprises, our experimentation has developed in depth, having been extended to grassroots units in scientific research departments and in various economic sectors such as industry, communications, commerce, the handling of goods and materials, banking, supply and marketing, and so on. There are 417 trial-point units among the industrial enterprises. Among the local industrial enterprises in the province, their output value, realized profits and profits turned over to the state respectively account for 70 percent, 80 percent and 90 percent of the totals. The results of their experiments will now decisively affect industrial development in our province. There are 238 trial-point units among the commercial enterprises as well as a relatively large number of enterprises experimenting with expansion of autonomy in the sectors of communications, banking, the handling of goods and materials and supply and marketing.

Increasing enterprise autonomy aims to free the enterprises from the fetters of the existing systems so that they can become genuine relatively independent producers of commodities. However, this aim cannot be achieved overnight. We must go through a definite process of development which includes several steps. We roughly envisage the following: First, we let the enterprises retain part of their profits and give them correspondingly greater autonomy in planning, marketing products and expanding reproduction; pay taxes instead of turning over profits to the state, and assume responsibility for their own profits and losses. (It must be clarified here that when enterprises under the system of ownership by the whole people assume responsibility for their own profits and losses, they do so to a certain extent and within certain limits under the conditions of the system of public ownership of the means of production. Some comrades call this a system of responsibility for profits and losses.) We must then further free the enterprises from their relations of subordination to various departments or local authorities, so that they will really be able to independently carry out management and production activities under the guidance of state planning. At present, the majority of enterprises in Sichuan are still taking the first step. Some 10 industrial enterprises and 99 commercial enterprises are experimentally assuming responsibility for their own profits and losses. There is still a long way to go before the enterprises can really become relatively independent producers of commodities.

Because we have increased enterprise autonomy, the enterprises in Sichuan have gained five categories of powers to different extents: the powers over part of planning, marketing part of their products, retaining part of their profits, and using their own funds to expand reproduction and labor personnel. Many changes have been caused by the increase in the enterprises' power. The most important one is that the enterprises have become dynamic organic bodies which have great vitality and which can grow by themselves. This change is of extremely profound and far-reaching significance. It enables our whole economy to acquire vitality.

(2) Reforming Economic Management Systems Centered Around Increasing Enterprise Autonomy

An increase in the enterprises' autonomy requires relevant economic departments to correspondingly assign greater power to the enterprises. That is, increasing their power must be concurrent with assigning greater power to them. Otherwise, increasing their power will be empty talk. The leading comrades of the provincial party committee have paid great attention to this point. From the very beginning of the experimentation, they organized the leading comrades of relevant departments at the provincial level to take part in the experimentation. Such departments include the planning, financial, goods and materials handling, commercial, personnel and labor departments. The comrades of these departments have been required to free themselves from the fetters of traditional ideas, have their ideology and action unified, vigorously reform various systems adopted by their departments, and jointly give the green light to increasing the enterprises' autonomy.

After 2 years and more of experimentation, Sichuan has accomplished a series of major reforms of various management systems.

In the arena of the planning system, in the past the enterprises could carry out production only according to the directive targets assigned by the state; now they can also formulate some plans to supplement state plans according to market needs.

In the arena of the goods and materials handling system, we have broken free from the theory that the means of production cannot be commodities. Aside from a few products which are important to our national economy and the people's livelihood or which are in short supply, and aside from dangerous goods, all of which are still purchased and distributed solely by the state, the majority of the means of production have found their way into the realm of circulation. Through direct supply contracts or through the market, the enterprises can purchase them to satisfy part of their own needs.

In the arena of the commercial system, monopolistic purchase and marketing by the state, monopolistic running of business and reliance on a single channel have been done away with. A commercial system embodying many channels of circulation, many forms of business operation and many economic sectors has been preliminarily formed. Industrial enterprises may market some of their products, and some large shops may directly purchase goods from factories without going through the link of wholesaling.

In the arena of the financial system, we have begun to put an end to centralized collection of revenue, centralized spending and the system of eating out of a big pot. The enterprises' relatively independent economic interests have been acknowledged. They can now enjoy a definite share of their profits which depend on how well they are run, and use these retained profits for tapping potential, renovating and restructuring, improving their workers' collective welfare, and increasing bonus payments. Thus, the enterprises are beginning to have internal economic motivation.

In the arena of the labor management system, there have been some tentative ideas of reform, such as recruiting workers by advertising and selecting the best candidates for the jobs, dismissing workers, and so on. However, these ideas have not been implemented because we have not yet been able to solve the employment problem.

The achievement of these reforms has been promoted by the move to expand enterprise autonomy. This move has provided a motive force, which goes from bottom to top, for the reform of our economic systems, as well as an objective basis for such reforms. Proceeding from expanding enterprise autonomy to reform our systems may be a means to achieve the goals of our reforms without having to experience major upheavals.

Proceeding from increasing the enterprises' power to reform our economic systems must be coordinated with other ingredients of a complete set of reforms. An enterprise should have many different kinds of power which cannot be separated from one another. An economic system is also an entity, a network composed of various systems. Any change in any one link will affect the overall situation. In expanding the enterprises' power, the right to retain part of their profits represents the core of the enterprises' autonomy. Without this right, other facets of their autonomy will be void. Therefore, to expand the enterprises' power, we must first reform the financial system. However, if the enterprises are denied other powers except the power to retain part of their profits, that is, if they cannot plan production according to market needs, nor market their own products, nor use their own funds to expand reproduction, and so forth, then it will be impossible for them to retain their profits. Therefore, the planning, commercial, goods and materials handling and other systems must also be reformed in conjunction with the reform of the financial system. In this sense, Sichuan's experimental reforms have been carried out in a thoroughgoing way. Of course, these amount to a large-scale undertaking. However, in practice, we may consider using complete sets on a different scale. We may start with a small-scale complete set, and then proceed to a medium-scale one and finally to a large-scale one. Our reforms which are centered on expanding the enterprises' power can be said to form a small-scale complete set. Reforms centered on requiring the enterprises to assume responsibility for their own profits and losses and to be reorganized or integrated, which include putting an end to their relation of subordination to various departments or local authorities, and which include reforms of the pricing and taxation systems, can be said to form a medium-scale complete set. The future reform of the entire structure of economic organization and the entire system of economic leadership can be said to form a large-scale complete set. By envisioning changes in this way, I wish to explain that reforms must be carried out simultaneously in complete sets, but it will also be impossible to get the whole set of reforms ready before we implement them.

(3) Integrating Regulation by Planning Mechanism With Regulation by Market Mechanism

Regulation by market mechanism plays a prominent role in the following four aspects:

1. According to traditional theory, under socialist conditions, the law of value does not play a regulatory role in the realm of production. As a result of our reforms, aside from complying with state plans, the enterprises can also formulate plans and carry out production according to market needs. Thus, changes in market supply and demand have begun to regulate, within certain limits, production at the enterprises and the orientation in their use of funds. Consequently,

the disparity between demand and output, which could not be changed for many years, has begun to narrow. This shows that the realm of production cannot be divorced from regulation by market mechanism.

2. Traditional theory acknowledges that the law of value plays a role in the realm of circulation, but limits its role to the circulation of the means of subsistence, excluding its application to the means of production. Actually, the means of subsistence are also allocated by the state, resulting in a vast disparity between supply and demand. In our reforms, we have subjected the majority of the means of production to the workings of the market mechanism, and let the market mechanism play a greater regulatory role in the realm of circulation, so that the disparity between supply and demand has markedly narrowed.

3. In the final analysis, regulation by market mechanism amounts to a pricing problem. Although we have not reformed the pricing structure, however, because we have practiced regulation by market mechanism, the old pricing structure, basically characterized by a single set of planned prices, has disintegrated. Fixed prices, floating prices, negotiated prices and free prices represent four forms of pricing which have just appeared. Although this change in the pricing structure has caused some commodity prices to rise, it has begun to put an end to the vast disparity, which has persisted for many years, between price and value. It has opened up the way to reform our pricing system and to use the price lever to regulate production.

4. The most conspicuous role of regulation by market mechanism is its increasing influence on the enterprises' economic interests, which, thanks to such regulation, have begun to be related to the competitive ability of the enterprises' products in the market. Consequently, competition, which has traditionally been viewed as a characteristic of capitalism, has appeared among enterprises of the same industry. Market competition is just like an invisible but powerful propeller, which forces the enterprises to try all means to produce superior-quality, inexpensive and marketable varieties of products, and to provide good service, so as to gain as much economic benefit as possible. It continuously urges backward enterprises to improve technology and management, so as to keep up with advanced ones. In our country, Sichuan is a locality where industrial development is relatively backward. The quality and varieties of products of its local industrial enterprises are far inferior to those of coastal regions. With the appearance of competition, commodities from the coastal regions have poured into Sichuan, posing a grave threat to Sichuan's local industries, but also creating a powerful motive force which encourages the enterprises to strive for progress and to improve technology, business operation and management. An increasing number of products of Sichuan's local industrial enterprises have begun to establish their own positions and nationwide competition. This demonstrates that even in the socialist mode of production, there are objective conditions for the existence of competition. Therefore, socialism should not preclude competition, but should "safeguard competition."

With the market playing a role, how to practice guidance by the planning mechanism has remained an unresolved practical issue. Nevertheless, macroeconomic control has still been safeguarded. Judging from Sichuan's experiences, state planning and administrative control still remain important constraints on regulation by market mechanism. In production, directive state planning has not been abolished. The value of the enterprises' products not produced according to state plans accounted for only around 10 percent of the total value of local industrial output in 1979, and around 20 percent in 1980. State planning has still been playing a leading role. In the marketing of products, in 1980, merely 17 percent of the total volume of commodities retailed in the province were sold through channels other than the state commercial units. Out of this 17 percent, 6 percent represented local industrial products. Thus, state commercial units still constitute the main body of circulation. Considering prices, the prices of the principal means of production, daily goods needed by the people and the majority of other products are still controlled by state plans. Some confusion has indeed occurred because of regulation by market mechanism and competition, but this has not been the main trend.

(4) Reorganize Industry and Practice Integration According to the Principle of Cooperation Among Specialized Units

With the expansion of enterprise autonomy and the appearance of competition, enterprises have begun to smash the boundaries between industries, between localities and between systems of ownership. Direct, horizontal links have been established among industrial enterprises; between industrial enterprises and commercial enterprises, goods and materials handling agencies; between industrial enterprises and agricultural enterprises; between civil industries and military industries; and between industrial enterprises and scientific research institutions. Many kinds of cooperation among specialized units and economic conglomerates have emerged as the times require. There are production conglomerates which mainly produce certain products through cooperation, marketing conglomerates which market products jointly, conglomerates for formation of complete sets which organize combinations of products into complete sets of equipment, production-related scientific research conglomerates which develop new products and new technology through cooperation, agricultural-industrial or agricultural-commercial conglomerates which process agricultural and sideline products, as well as agricultural-industrial-commercial conglomerates which take commercial business as part of their work. By the end of 1980, a number of integrated organizations had been established in the province, including 45 specialized companies of various types which are run as enterprises, 8 integrated groups of factories, and 150 economic conglomerates of various types with a total membership of 988 enterprises. The formation of various types of specialized companies and economic conglomerates reflects a process whereby production and funds are centralized. Cooperation among specialized units and integration have given rise to new productive forces.

Judging from the development of integration and cooperation among specialized units in Sichuan, integration and such cooperation are not artificial inventions, but are the inevitable consequence of developments in competition and expansion of enterprise autonomy. They are essential to socialized large-scale production, and to the enterprises if they want to extend their production capability and improve their economic results. Integration and cooperation among specialized units represent an integration of various parties' economic interests. If rational division of labor and cooperation alone are emphasized at the expense of various parties' economic interests, integration will not be successfully accomplished. The enterprises' relation of subordination to various local authorities or departments is antagonistic to and is the greatest obstacle to integration and cooperation among specialized units. We must do away with this relation, so that the enterprises can really become relatively independent. Then, integration coupled with cooperation among specialized units will be able to develop on a large scale. Therefore, we must take further steps to substitute taxes for profits that are turned over to the state as well as carry out other reforms.

In integration, the emphasis on the enterprises' economic interests, voluntary change and mutual benefits does not preclude wholesale promotion, organization, coordination and intervention by the state. Ours is a socialist planned economy. To achieve integration and cooperation among specialized units, it is absolutely necessary for us to go from top to bottom in formulating unified plans and achieving rational distribution in a planned and gradual manner. If we can integrate the enterprises' interests with the state's efforts, integration and cooperation among specialized units will develop much more smoothly.

(5) Implementing on a General Scale the Principle of Material Benefits; Seeking Principles, Forms and Methods Correctly Embodying the Interests of the State, the Enterprise and the Individual

In the experimental reform of our systems, we have solved the problem of the right of enterprises under the system of ownership by the whole people to enjoy relatively independent economic interests, and have designed and experimented with five forms of distribution of profits between the state and the enterprise as well as three forms of distribution of profits between the enterprise and the individual. If the enterprise has its own economic interests, and if the workers' benefits are closely integrated with the enterprise's interests, then the enterprise will become vigorous.

The five forms of distribution of profits between the state and the enterprise are: (1) sharing a basic level of profits plus sharing profits in excess of this basic level; (2) sharing the total profits; (3) assuming responsibility for one's own profits and losses; (4) undertaking the whole task if it results in losses or meager profits; and (5) profits of enterprises under county authorities to be shared in the proportion of 4:3:3 (or 4:4:2). Each of these five methods has its particular effectiveness and shortcomings. The first method provides for a relatively stable and reliable distribution of benefits for both the state and the enterprise. However, because the basic level of profits depends on the previous year's figures, the enterprises are disinclined to tap their own potential. The second method is simple and convenient, but if the proportion is not appropriate, the state's benefits will be prone to be affected. The merits of the third method are that economic results are marked, reasonable revenue for the state is insured and the enterprise must bear risks. However, there is a different tax rate for each enterprise and consequently it is not easy to popularize this method. The fourth method is most effective. If a task is undertaken by an industry as a whole, the effects will even be better. The fifth method is suitable for small enterprises run by county authorities. However, if the method is applied to state-owned and collectively run enterprises which pay taxes instead of turning over profits to the state and which assume responsibility for their own profits and losses, the effect will even be better.

Because there are different methods, the ratio in which profits (this refers to profits remaining after payment of industrial or commercial taxes) are shared between the state and the enterprise varies. If the method of sharing a basic level of profits plus sharing profits in excess of this basic level is adopted, the enterprise will get a smaller share. If an enterprise assumes sole responsibility for its profits or losses, it will get a larger share.

From the figures obtained in our experiments, can we derive correct quantitative limits governing the distribution of profits between the state and the enterprise? Can we discover any objective basis on which these limits should be defined? Our tentative idea is that as a relatively independent producer of commodities, an enterprise which assumes responsibility for its own profits and losses should have three categories of economic power, namely, the power to utilize after-tax profits to carry out expanded reproduction which is closely related to simple reproduction; the power to provide collective welfare to the workers; and the power to pay wages and bonuses to the workers. That is to say, expenditure in these three areas should come from the enterprises' after-tax profits. If these three categories of power are justified, then the enterprise income ration adopted by five enterprises in Sichuan that are responsible for their own profits and losses may provide reference for defining the quantitative limits governing the distribution of profits between the state and the enterprise.

However, the ratio in which profits are to be distributed between the state and the enterprise should not only depend on the economic powers due to the enterprise as a relatively independent producer of commodities, but should to a large extent depend on the situation of state fiscal revenue. Recently, the proportion of the enterprises' income has only been able to depend on whether the state can obtain sufficient revenue from the growth in the enterprises' current profits. Only thus can the reform of our economic systems develop healthily with state fiscal revenue growing steadily, or with state expenditures decreasing correspondingly in the absence of any growth in revenue. Judging from Sichuan's experiences over the past 2 years, a relatively appropriate proportion of the enterprises' income is around 10 percent.

There are three main forms in which benefits are shared between the enterprise and the workers: 1) For enterprises adopting the method of sharing a basic level of profits plus sharing profits in excess of the basic level, their workers' basic wages, legal bonuses (12 percent of standard wages) and collective welfare funds (11 percent of total wage payments) are set aside according to state regulations. In addition, part of the enterprises' profits are allocated for collective welfare or for awarding individual bonuses to workers. 2) For enterprises whose total profits are shared between themselves and the state, their workers' basic wages are paid according to general regulations. The workers' individual bonuses and collective welfare funds are all drawn from the enterprises' retained profits. 3) For enterprises which assume sole responsibility for their own profits and losses, their workers' basic wages, bonuses, collective welfare funds and so on are all drawn from the enterprises' after-tax profits. Among these three methods, the correlation between the workers' economic benefits and the success in running the enterprises decreases from the third method to the second, and then to the first one. Nevertheless, even the first method is much better than excessive collectivism. If it is impossible to practice any of the desired methods, we may consider taking these three methods in three progressive steps. By its nature, a bonus is a reward for labor performed in excess of some set quota.

Whichever method is adopted, distributing individual bonuses to workers must follow the principle of distribution according to work done. To implement this principle successfully, we must rectify and strengthen basic enterprise management work, as well as establish and perfect various systems of job responsibility in conjunction. Only thus will there be a scientific basis for calculating the quantity and quality of a worker's labor.

(6) Staff and Workers To Be Masters of Their Own House and Manage Enterprises

Increasing enterprise autonomy correspondingly gives rise to a major problem. Who will be responsible for decisionmaking in the enterprises?

In some socialist countries, workers are subordinate to factory directors, whose decisions usually determine how well the enterprises are run. Yugoslavia adopts a system of autonomy by the workers, with the factory directors responsible to worker councils. Judging from our country's actual conditions, we must gradually turn staff and workers' congresses into the highest organs of power in enterprises. Factory directors should be elected by and responsible to staff and workers' congresses. Moreover, they must be appointed by and responsible to the state. Important matters concerning the enterprises should be decided by the staff and workers' congresses. The factory directors will participate in the whole decisionmaking process and execute the staff and workers' congresses' resolutions. If such resolutions are in conflict with the state's principles or policies, or go against our national interests, the factory directors will have the power to request reconsideration of these resolutions by the staff and workers' congresses, to report such cases to higher authorities, or to suspend execution of these resolutions. The party committees of the enterprises should mainly educate the staff and workers, encourage them to exercise their rights as masters of their own house, insure that these rights are not infringed upon, and participate in the entire decisionmaking process. It seems that such a system of decisionmaking will be more compatible with our country's actual conditions.

The above-mentioned reforms have brought unprecedented vigor to the economy of Sichuan. The success is very marked. Between 1978 and 1979, the value of the output of 84 local industrial enterprises among 100 trial-point enterprises increased by 14.9 percent, their realized profits grew by 33 percent, and the profits they turned over to the state grew by 24.2 percent. In 1980, the five enterprises which had been experimenting with assuming responsibility for their own profits and losses displayed additional vitality. The value of their output grew by 42.7 percent over the previous year, their realized profits grew by 80.7 percent and their profits turned over to the state grew by 49.1 percent. Because Sichuan was beset with grave shortages in the supply of energy resources, great inadequacy of production tasks for heavy industrial enterprises and other difficulties, and because of backward management and some defects in the methods of reform, the total profits turned over to the state by all local industrial enterprises decreased by 7.55 percent compared with the previous year. This decrease resulted from a 30.3 percent drop for non-trial-point enterprises and a 3.7 percent drop for trial-point ones. However, absolute figures reveal that in 1980, the total profits turned over to the state by all industrial enterprises in the province amounted to 880 million yuan, while the trial-point enterprises turned over 94,000 [as published] yuan. That is to say, the trial-point enterprises turned over more profits to the state than the rest of the provinces; the profits from the trial-point enterprises offset the other enterprises' losses.

Because the profits turned over to the state by some of the trial-point enterprises decreased compared to the previous year, some comrades have become skeptical of Sichuan's experiments in reforming the economic systems. Considering this in relation to the serious fiscal deficits, inflation and price rises in our country, some people even wonder whether these latent dangers are due to inappropriate reforms. Meanwhile, we have considered these problems and found that although some defects in the specific methods of reform did exist, the overall orientation is correct and the main trend is good. Therefore, we need to clear up some views.

First, on the Criteria for Evaluating the Results of the Reform of Our Economic Systems

How good are the results of the reform of our economic system? Since last year, we have been assessing the results by three indicators, namely, output value, realized profits and profits turned over to the state. These criteria are undoubtedly correct (of course, not absolutely correct) in normal circumstances. However, in a situation of economic readjustment, there is a problem that some conditions are not comparable. Considering the changes in our principles governing construction, these several criteria alone are also inadequate. In 1979, when we readjusted our economy, some enterprises were faced with the problem of the lack of production tasks and demand for their products. Then, some trial-point enterprises took advantage of their expanded autonomy to "seek out rice to put in their pots" and market their own products, so that they could achieve substantial growth in all three targets. However, by 1980, for one thing, the problem of lack of production tasks for the trial-point enterprises deteriorated; the tasks assigned by the state to some trial-point enterprises with high profit rates in relation to their output value, in particular the metallurgical, machine building and chemical and pharmaceutical enterprises, amounted to only 30 to 50 percent of their production capacity. It became increasingly difficult to "seek out rice to put in their pots" by relying on their original products. For another thing, the energy resources shortage began to develop into a crisis, so that even the limited number of production tasks were affected. Consequently, the enterprises were forced to reduce or even stop the production of old products, vigorously change the composition of their products, produce new varieties and improve the economic effect to comply with social needs. Thus, the enterprises' output value and profits dropped, but they have embarked on a new road of development. For example, the year before last, the Chengdu Measuring Instruments and Cutlery Factory mainly produced prestigious products with high output value and profits. However, because of blind production and inadequate demand for its products, the value of overstocked products amounted to one-fourth of the value of its total output that year. Last year, the factory changed its policy of operation, and despite a 20 percent drop in output value and a 21.98 percent drop in profits compared with 1979, because it developed more than 100 new products urgently needed by society, it was able to sell all the products it produced last year. Consider another example, the Ningjiang Lathe Factory. In 1979, a very large proportion of its products were products which yield a high profit rate, such as jig borers. Last year, tasks to produce such products were cancelled, and tasks to produce instrument machine tools, which require a great deal of working time and bring about low profit rates, increased drastically. The fulfillment of orders for these newly produced products will stretch into 1982. However, the profits have been smaller than those of the previous year. Yet another example is the Chengdu Seamless Steel Tubes Factory. In the past, it mainly produced large-bore, thick-walled tubes. The year before last, there was a problem that such tubes were unmarketable. Last year, the plans assigned by the state provided for an output which amounted to only 41 percent of its production capacity. It resolved to alter the composition of its products, and therefore drew 5 million yuan from its retained profits to develop new product varieties. Consequently, the output of small-bore tubes and thin-walled tubes increased by 100 percent and 460 percent respectively over the year before last. It also carried out the trial manufacture of casing pipes and drill pipes for oil extraction. Last year, it produced 210,000 tons of steel tubes, of which only 0.37 percent did not satisfy the requirements of contracts. These examples illustrate that because of our large-scale economic readjustment, the external conditions for the enterprises have changed drastically, giving rise to many factors which make comparison impossible. To use merely three indicators to make comparisons with the previous year in evaluating the reform of our economic systems is not only unscientific, but is also not absolutely compatible with the orientation of our reforms, namely, to make the running and management of the enterprises change over from some work done simply to fulfill state plans to some work done to satisfy the people's material and cultural needs--a new path for us to embark on. Therefore, to evaluate the results of our reforms of economic systems, we should not only notice the rate of economic growth, but should also look at the extent to which social needs are satisfied and the magnitude of social economic benefits. It is particularly necessary for us to do so during a period of major economic readjustment, when principles of our construction are changing. If the enterprises' products are marketable and can satisfy the people's needs, and if new products are continually supplied in response to market changes, then even if the economic growth rate is falling or even becomes negative, we should think that the enterprises have achieved great success and should commend them. It is because this reflects a qualitative change in the policies concerning the running of enterprises, which results in much greater material benefits for the people than if the growth rate is very high but the products are overstocked because they are unmarketable.

Second, the Problem of Expanding Reproduction by Relying on the Enterprises' Own Funds

The leading comrades of the party Central Committee have pointed out that in the future, our national economic development will not rely mainly on extending the scale of capital construction, but will rely on bringing the role of the existing enterprises into play. This is a very important strategic decision. Bringing the role of the existing enterprises into play involves not only strengthening the running and management of the enterprises, but also the important tasks of tapping their potential, renovating and restructuring them and expanding reproduction. Should tapping their potential, renovating and restructuring them be effected by relying on state investment, or by letting the enterprises use their own funds and requisite bank loans? Sichuan's practical experience over the past 2 years has proved that we should adopt the latter method. Although in the past we also tried to transform old enterprises, however, because investment, materials, equipment and construction workers were all subject to centralized state planning and the enterprises' initiative was not brought into play, there was still a great deal of waste and results were not satisfactory though economic results were better than if new enterprises were built. Since greater power was assigned to the enterprises last year, the work of tapping their potential, renovating and restructuring them has been closely integrated with the enterprises' economic benefits and they have taken their own business into their own hands, practiced careful calculation and strict budgeting in their investment, tried all means to economize on materials and equipment, allocated construction workers internally, and strived to complete projects in the shortest possible time. To make sufficient funds available for transformation, the workers of some enterprises voluntarily suspend the repair of their living quarters and the distribution of bonuses to overcome difficulties. Some comrades have estimated that compared with relying on state investment, tapping enterprises' potential, renovating and restructuring them by relying on the enterprises' own strength will reduce the amount of funds needed by one-third, and will result in faster completion of projects. If the enterprises have their own funds as well as the power to tap their own potential, renovate and restructure themselves, will this lead to duplicate construction, duplicate production and extension of the capital construction front? Such phenomena will be possible, but not inevitable. If we strengthen state control over and comprehensive equilibrium in the enterprises' investment, as well as institute necessary procedures in granting permission and carry out administrative intervention, we will be able to solve these problems. Judging from how the enterprises have tapped their own potential, renovated and restructured themselves over the past 2 years to expand enterprise autonomy, relatively larger projects undertaken in Sichuan have basically been necessary. Duplicate construction has not been mainly due to expansion of enterprise autonomy, but has been due to sharing of financial responsibility for undertaking whole tasks between two levels, and due to blindness in developing enterprises run by communes or production teams.

Third, the Problem of Vitality Versus Disorder

Our reforms have enlivened the economy, but have also led to some disorder. For example, speculation, profiteering and violation of laws or discipline are on the increase. Even some capitalist things have emerged. How should we view these problems? I think that if we want the reforms, these problems will inevitably emerge, because the prerequisite for our reforms is to admit that our economy is a planned socialist commodity economy, and an important orientation of our reforms is to vigorously develop the production and exchange of commodities and to fully bring the role of regulation by market mechanism into play under the guidance of state planning. Therefore, certain defects of the commodity economy will emerge, and it is not surprising that those problems should occur. Our policy is that we must enliven the economy, and must also control those problems and curb them when necessary. The current problem is that we have not tackled them at all, or we have tackled them in a rigid way, thus reverting to the beaten track. These two erroneous tendencies must be corrected.

Fourth, Should the Enterprises Under the System of Ownership by the Whole People Assume Responsibility for Their Own Profits and Losses? Can They Assume Responsibility for Their Own Profits and Losses?

Both the theoretical circles and the departments responsible for practical work have debated this question. I think that it is objectively inevitable that enterprises under the system of ownership by the whole people, as relatively independent producers of commodities, will have to assume responsibility for their own profits and losses within certain limits and to a certain extent in their operation and management. (This is called a profit and loss responsibility system.) All enterprises should take this road. Otherwise, the problem of eating out of a big pot will never be solved. Although in Sichuan there are only five enterprises assuming responsibility for their own profits and losses on a trial basis, they are showing the way. In the past, we said that these enterprises enjoyed favorable conditions, were not typical and could not demonstrate the superiority of assuming responsibility for one's own profits and losses. Recently, I have seen these five enterprises' economic achievements during the first quarter of this year: an 11.8 percent growth in output, a 21 percent growth in profits and a 37.4 percent growth in the sum of the three categories of taxes paid to the state. I think we must change our view about these five enterprises and study their experiences in depth. First, two of these enterprises have been assigned an adequate number of tasks, their supply of raw materials and other materials has been insured, and their profit rates are also high. They can justifiably be called "fat enterprises." However, two other enterprises are in a different situation. Last year, the planned tasks assigned by the state to the electric wire factory amounted to only 11 percent of its production capacity, and this year the situation has been worse. The state-planned tasks for the Xinan Electrical Appliances Factory have been maintained at some 40 percent of its production capacity, and it must always seek tasks by itself to utilize the rest of its production capacity. Can we say these two [?are "fat] enterprises." The planned profit target for the First Sichuan Cotton mill set early last year was 45 million yuan, but in July the staff and workers' congress resolved to raise the target to 50 to 55 million yuan. The actual profits turned out to be 60 million yuan, a nearly 100 percent increase over the previous year. Similar things happened to the Chongqing Watch and Clock Company. Such a great achievement cannot be explained simply by saying that they are "fat enterprises." We must acknowledge the important role of assuming responsibility for one's own profits and losses.

II. Some Problems in Our Reform of Economic System

The reforms in Sichuan over the past 2 years have not been perfect. There have been a series of problems which we must solve. The three major problems are as follows.

(1) In Enlivening Microeconomics Macroeconomic Guidance Has Not Shown Corresponding Progress

Increasing enterprise autonomy, practicing regulation by market mechanism and launching competition have played a positive role in encouraging the enterprises to produce marketable products and improve economic effect so as to satisfy the materials and cultural needs of all members of society. However, because the enterprises have independent economic interests of their own, their interests are prone to conflict with those of the state. At present, there are four main problems: First, not following state plans in carrying out production; second, duplicate construction; third, lavish distribution of bonuses; and fourth, extending the range of products sold by the enterprises themselves. We must take measures to solve and prevent these problems. However, we must definitely not severely restrict the enterprises' production and business activities again as a solution. Instead, while continuing to enliven the enterprises, we should also mainly strengthen macroeconomic guidance and integrate the enterprises' interests with those of the whole society. For example, the enterprises may be allowed to independently carry out production and business activities, but they must not swerve from the orientation of production stipulated by the state, and must fulfill the plans assigned by the state. The enterprises may be allowed to use their own funds to carry out expanded reproduction which is closely related to simple reproduction, but the orientation of their investment must be in line with the needs of national development, and must be subject to the permission and requirements of comprehensive equilibrium stipulated by state planning bodies. If an enterprise is making profits, it may increase bonuses for its workers, but it must not surpass the total growth in wages stipulated by the state. The means of production and means of subsistence must be circulated through many channels and the enterprises may sell some products themselves, but the state commercial agencies and goods and materials handling departments will always remain the main channel of circulation. To sum up, the enterprises' production and business activities must satisfy these two conditions: compatibility with the enterprises' own economic interests, and compatibility with the state's interests. It is very difficult to solve these problems. To tackle them, we must formulate correct policies, adopt appropriate economic measures and rely on rigorous economic legislation and supervision.

(2) Some Stipulations and Methods of Handling the Relationship Among the State's, the Enterprise's and the Staff and Workers' Interests Have Been Inappropriate

Last year, when we were formulating the method whereby total profits are shared between the enterprises and the state, we inappropriately put forward the slogan: "Safeguard vested interests." In our trial-point methods, we incorporated 20 percent of the enterprises' original share of surplus profits into the basic level of the enterprises' share of profits, so that some enterprises whose profits have decreased still retain a large share of profits while state revenue is reduced. This is irrational. The slogan of safeguarding vested interests is erroneous, because: 1) With inequality in the enterprises' external conditions, such as prices, the vested interests of some enterprises have not been acquired through the enterprises' own efforts. Such vested interests must not be safeguarded. 2) Circumstances are always changing. When the profits of some enterprises fall, their income should correspondingly fall. The vested interests must not be safeguarded. Therefore, we must certainly change this method. However, because we declared we would not change it for 3 years, we have resolved to temporarily put off any changes. Nevertheless, we must clearly explain this issue to the enterprises.

(3) There Is Grave Inequality in the Enterprises' Economic Hardships and Benefits. We Have Not Yet Found a Correct Solution to This Problem

The emphasis of our reforms is on increasing the enterprises' power. However, we have not concurrently carried out reforms trade by trade. This is a shortcoming. If our reforms are on the basis of individual trades, then through internal pricing, we may regulate the inequality among various enterprises in the same trade, and may even practice centralized planning, arrangement and use of funds within the domain of an individual trade in tapping the enterprises' potential, renovating and restructuring them, so that duplicate production or construction may be avoided.

III. Some Tentative Ideas About Carrying Out Reforms in the Course of Readjustment

Our overall view is that during readjustment, readjustment and reform must supplement each other. We should vigorously carry out all reforms that are favorable to readjustment. Otherwise, we will not be able to achieve the aims of readjustment. From the long-term point of view, the steady and coordinated development of our national economy will depend on the establishment of new economic systems which are compatible with our national condition. If we do not vigorously and steadily reform our economic systems, or if we even revert to old practices, our cause of the four modernizations will not develop smoothly.

We initially envisage the following several measures of reform:

(1) Simultaneously Continue To Enliven Microeconomics and Strengthen Planned Guidance Over Macroeconomics

We hold that we should persist in and safeguard whatever reforms have been proved to be correct and effective in practice over the past 2 years. At the same time, we must adopt many solutions to solve the problems emerging in the enlivening of microeconomics, instead of allowing these problems to exist. Strengthening macroeconomic guidance should be interpreted in the broad sense. It embodies at least five things: 1) Macroeconomic guidance embodies guidance over formulating both directive planning and guidance planning. We must both formulate annual plans and firmly grasp the formulation of medium-term and long-term plans.

In the initial stages of our reform, both directive planning and guidance planning should coexist and must be integrated with various economic means. 2) It embodies guidance over using economic levers. That is, we must fully exploit the role of pricing, taxation and interest rates to guide and promote microeconomics in the orientation stipulated by the state in matters of economic interests. 3) It embodies guidance over supplying market information. Under the conditions of a commodity economy, market information is very important. The enterprises and leading economic bodies at all levels should establish special agencies and assign special personnel to take charge of matters related to market information, so that in the near future, we may be able to supply economic information concerning various industries or products to the enterprises, just as meteorological observatories issue weather forecasts. 4) It embodies establishing a normal economic order through economic legislation, management and supervision. We should begin with formulating provisional management regulations, then proceed to formulate formal regulations, and finally enact laws through the NPC on the basis of summing up experiences. 5) It embodies any necessary administrative intervention, which refer to administrative decrees concerning certain particular matters. Such decrees will permit certain things to be done and prohibit other things from being done. For example, the resolution to freeze commodity prices promulgated by the State Council belongs to this category. Administrative intervention should be adopted as infrequently as possible.

(2) Consolidate and Improve the Results of Expanding the Enterprises' Power, and Further Promote the Advancement of Expansion of Power

The enterprises must make the transition from retaining part of their profits to assuming responsibility for their own profits and losses (or profit and loss responsibility system). Different methods may be adopted by different enterprises in the light of their different circumstances. Large and medium-sized enterprises under the system of ownership by the whole people should gradually change over to a profit and loss responsibility system if conditions favor their adopting this system. The other enterprises should adopt either a system of retaining part of their profits or an enterprise funds system. If we can gradually accomplish these changes within several years, then we will be able to free the enterprises from the old system of eating out of a big pot and enable them to achieve greater economic benefits.

(3) Vigorously Promote Reorganization and Integration of Enterprises

To reorganize the industrial enterprises according to the principle of coordination among specialized units and to promote the integration of these enterprises constitute an important ingredient of our current readjustment work and of our reforms. We must rely on key cities and make plans for industrial enterprises in and around these cities (including military industrial enterprises). Then, by means of coordination, we will formulate overall plans for the whole province. Reorganization plans will be established following dialectical analysis and theoretical proof of feasibility as well as the making of comparisons. Such plans will be implemented, and relevant organization work will be carried out, after they have been approved. When various conglomerates have been formed via reorganization and integration, we may consider using these conglomerates, which will by nature be organizations formed on the basis of individual industries, to practice management and coordination. However, by relying on key cities, we must not cause the enterprises to be brought under lower administrative levels, or cause management to be divided up among separate local authorities.

(4) Rectify and Reform Management of Existing Enterprises

Here we should follow three principles. 1) According to the principle of a commodity economy, enterprise management must comply with the requirements of the law of value, so that the running and management of enterprises will change over as speedily as possible from eating out of a big pot to independent accounting and assuming responsibility for one's own profits and losses. 2) According to the principle of socialized large-scale production, we must comply with the requirements of socialized large-scale production and as soon as possible establish a system of job responsibility governing factory managers, a system of directing production whereby factory managers exercise leadership and a system of job responsibility governing various categories of personnel at various levels. We must conscientiously strengthen basic enterprise management work, such as keeping original records, calculation, management by quotas and so on, so as to lay a foundation for scientific management. 3) According to the principle of socialism, to rectify and reform the management of existing enterprises, we must fully bring the superiority of socialist enterprises into play. The three most important things are: 1) we must earnestly transfer the power of making decisions on major enterprise affairs to the staff and workers' congresses, so that the staff and workers will really become the masters of their own house; 2) we must sum up experiences, carry out political and ideological work by means of scientific methods, and continually raise the staff and workers' consciousness; and 3) by means of various responsibility systems, we must link staff and workers' income to the fruits of their labor, overcome egalitarianism in distributing bonuses, and practice [words indistinct] can only be testified or disproved by practice.

BRIEFS

HUNAN COMMERCE CONFERENCE--The Hunan Provincial CCP Committee and the Hunan provincial people's government held a provincial commercial work conference recently in Changsha. The conference discussed how to support production, expand sales, stabilize prices and invigorate the market. The conference was attended by more than 500 people including comrades responsible for financial and commercial work in the prefectures, municipalities and counties. Responsible persons of the provincial party committee, the provincial people's congress standing committee and the provincial people's government, Wan Da, Liu Fusheng, (Ji Zhaoqing), Cao Wenju and Shang Zijin, spoke at the conference. [OW200555 Changsha Hunan Provincial Service in Mandarin 1100 GMT 14 Jul 81]

BRIEFS

HEILONGJIANG, ANHUI TAXATION--Beijing, 18 Jul (XINHUA)--By the end of June Heilongjiang and Anhui Provinces had already fulfilled over one-half of their annual tax collection plans. The amount of taxes collected by Heilongjiang during the first half of the year exceeded that of the corresponding period for last year by over 47 million yuan, or 5.1 percent. Of the amount of taxes collected by Anhui during the same period, 52.4 percent--or 7 percent more than the same period last year--came from the light and textile industries and daily consumer goods industry. The fairly successful accomplishment of these two provinces' tax plans can be attributed to their intensified efforts in tracking various types of tax evasion. [OW221654 Beijing XINHUA Domestic Service in Chinese 1217 GMT 18 Jul 81]

QINGHAI CURRENCY WITHDRAWAL--In the first 6 months of 1981, Qinghai Province, instead of putting 5 million yuan into circulation, which is a limit set by the state, withdrew 6.91 million yuan of currency from circulation. This amount is 12.64 million yuan more than that in the corresponding 1980 period. This indicates that the national economic readjustment has achieved initial success. BRIEFS

GUANGDONG LIQUEFIED PETROLEUM GAS--The Guangdong Maoming Petroleum Industrial Company exports liquefied petroleum gas to Macao. It is welcomed by the people there. Since 1980, the company has exported more than 1,000 tons of liquefied petroleum gas to Macao, worth $260,000 in foreign exchange. Liquefied petroleum gas is an ideal gas for civil use in urban areas. To produce more liquefied petroleum gas, the Maoming Petroleum Industrial Company has installed more facilities to improve the operation of production. In the first 5 months of 1981, the quotas for production and export of liquefied petroleum gas have been fulfilled. [Guangzhou Guangdong Provincial Service in Mandarin 1000 GMT 22 Jun 81 HK]

HUNAN POWER GENERATION--During the first half of 1981, Hunan generated 5.8 billion kwh of electricity, fulfilling 51.9 percent of its 1981 annual target and marking an increase of 2.7 percent compared to the same period in 1980. It also exerted strenuous efforts to save coal in generating electric power. As a result, it saved 29,700 dun of coal during the first 6 months in 1981. [OW110623 Changsha Hunan Provincial Service in Mandarin 1100 GMT 8 Jul 81 OW]

NATIONAL HYDROELECTRICITY DISCUSSION--The national academic discussion on increasing the economic effect of the small hydroelectricity stations was held in Yangshan County in Guangdong Province from 1 to 9 June. Engineers and technicians engaged in research in small hydroelectricity stations, experts and scholars of universities, colleges and scientific research units and responsible comrades of departments concerned from 25 provinces, municipalities and autonomous regions--some 140 people altogether--attended. The representatives listened to the experience of the county in strengthening scientific administration and increasing the economic effect in the small hydroelectricity stations and to the experiences of other localities. They discussed the special subject of increasing the economic effect in the small hydroelectricity stations. [HK260916 Guangzhou Guangdong Provincial Service in Mandarin 2330 GMT 14 Jun 81]

BRIEFS

TITANIUM WHITE PRODUCTION--Beijing, 22 Jul (XINHUA)--Scientists at the Institute of Chemical Engineering and Metallurgy, the Institute of Dynamics and the Tianjin Chemical Works have succeeded in trial-producing an industrial pigment, rutile titanium white, for the first time, according to the Department of Chemistry of the Chinese Academy of Sciences. The pigment, under development since 1975 by a staff of 30 scientists, is used in the production of synthetic fibers, paper, plastic articles, rubber, ceramic ware, paint and printing ink. Previously, China, though rich in titanium resources, had to import the pigment, the production of which requires complicated technology. The titanium white is now being used in several paint and printing ink factories in Tianjin, Beijing and Dalian. A plant for semi-industrial production is being built in Tianjin. 'JINGJI GUANLI' ON PHOSPHATE FERTILIZER PLANT

HK300906 Beijing JINGJI GUANLI [ECONOMIC MANAGEMENT] in Chinese No 6, 15 Jun 81 pp 27-28

[Article by the Economic Commission of Mianyang Prefecture of Sichuan Province: "Enterprises Responsible for a Task Until Its Completion and With Limited Profits Should Also Have Their Power Expanded"--Learning from the Jingyang Phosphate Fertilizer Plant assuming responsibility for a task until its completion and with limited profits--slantlines denote boldface]

[Text] In the reform of the economic management system, expanding the decisionmaking power on a trial basis of those enterprises which have great profits has been proved by practice to be correct in its orientation. No unified thinking up till now has been reached on the matter whether or not enterprises with limited profits should also have their decisionmaking power expanded. The practice of the Jingyang Phosphate Fertilizer Plant in the past year shows that the decisionmaking power of enterprises with limited profits should also be expanded.

What Was the Basis for the Losses in the Past 8 Years?

The Jingyang Phosphate Fertilizer Plant has net fixed assets of 2.83 million yuan and a total of 446 staff members and workers. After operating for 14 years and due to abnormal production, it incurred losses for 8 years running, with a total of 810,000 yuan in losses. The losses incurred in this enterprise did not mean that its leadership, staff members and workers had not worked hard, rather, it was the result of excessive and rigid control of the present management system.

/1) The excessive and rigid control of planning bound the enterprise hands and feet, thus the staff members and workers lacked initiative and enthusiasm./ The planning for the production and marketing of products was passed down to the enterprise by the higher authorities in a unified way and the latter had to organize the production and sale of its products according to the instructions from the higher authorities and was not in a position to make any complementary plans of its own. All profits were handed over and all losses were made up by the higher authorities. Even if the enterprise had to stop production for 6 months of the year, everybody still "felt at ease and justified."

/2) Since the materials were under unified control, the enterprise was unable to carry out regulation by market mechanism./ The main raw materials needed for production such as sulphuric acid and phosphorus ore were under unified planning and distribution as well as allocation. The supply of sulphuric acid had continuously fallen short of demand. The enterprise required large quantities of powdered phosphorus ore, instead it was supplied with a mixture of powder and stone. The enterprise once joined with other similar enterprises to organize their own supply of sulphuric acid and phosphorus ore, but they were branded as "organizing a reckless and thoughtless cooperative and as taking the capitalist road." Thereby, forcing these enterprises to "live within the state plan."

/3) The equipment of departments of the enterprise did not form a complete set, thus the enterprise was producing under its capacity./ When a discontinued cement plant was rebuilt into a phosphate fertilizer plant in 1965, only one set of ball-type grinding equipment and industrial chemical equipment with the capacity of producing 60,000 tons of calcium bicarbonate [pu gai 2528 6862] per year were installed without the necessary supplementary complete sets of equipment for producing sulphuric acid. As a result, the phosphate fertilizer plant had to consistently seek a supply of sulphuric acid. The supply of sulphuric acid has fallen short of demand for a long time in our country. Coupled with the serious corrosion of equipment, the enterprise, operating under capacity, suffered great economic losses. This is the important reason why losses were incurred in the plant.

Why Could 300,000 Yuan of Profits Be Made in 1980?

The Jingyang Phosphate Fertilizer Plant was provided with 2,669 tons of sulphuric acid in 1980 according to the state plan, and was asked to produce 7,000 tons of sulphuric acid within the plant. These two combined amounts equaled less than half of the annual volume of consumption of the plant. In addition, the supply of phosphorus ore according to the state plan was still a mixture. If the enterprise continued to "live within the state plan," it would have continued to suffer losses. For this reason, the enterprise's departments responsible for production work and the financial department concerned met and decided that the Jingyang Phosphate Fertilizer Plant could "assume responsibility for a task until its completion and with limited profits. Accordingly, it should hand over 30,000 yuan of its profits to the higher authorities, retain that part of profits in excess of the plan for its own use, which can be used for tapping, innovating and transforming the enterprise. In the event it failed to hand over the profits originally agreed upon, it will pay interest on this portion of the outstanding account to the financial department concerned and its staff and workers would not be in a position to receive bonuses. Meanwhile, the plant was to be given specific decisionmaking power in production and management." Through practice in 1980, it achieved the best results since it went into operation 14 years ago, thus removing the label of incurring losses for 8 years running from itself. The annual output of calcium bicarbonate was 52,500 tons, a gain of 34,700 tons over 1979, or an increase of 162.6 percent over the 1980 state-assigned quota. The plant made 300,000 yuan in profits, and handed over 36,300 yuan of its profits to the higher authorities, 6,000 yuan more than was originally agreed to be handed over. This "assumption of responsibility" for a task until its completion and with limited profits integrated economic responsibility with the economic interests of the plant and of its staff and workers. In fact, it is a responsibility system linking the handing over of profits of an enterprise to the state. The task of assuming certain economic responsibilities from the higher authorities by an enterprise and the economic interests serving as the motive force among the departments of an enterprise enhanced the enthusiasm of an enterprise and its staff and workers, and helped to achieve improvements in production and management in four fields:

/1. Under the guidance of state planning, production plans were worked out according to the principle of production according to sale, thus the production level rose remarkably./

The calcium bicarbonate in phosphate fertilizer as a commodity supply fell short of demand. The counties, cities and the people's communes concerned vied with one another to place orders for calcium bicarbonate with the Jingyang Phosphate Fertilizer Plant, totaling 45,000 tons in all and constituting 45 percent of the total output of calcium bicarbonate for the whole district. After investigating the market conditions and requesting a supply of phosphorus ore and sulphuric acid and in line with the materials allocated according to the state plan for producing annually 20,000 tons of calcium bicarbonate, the plant worked out an annual plan to actually produce 50,000 tons of calcium bicarbonate. Hence the initiative and enthusiasm of the enterprise's staff and workers was aroused. Practice has shown that the integration of the unified balance of the state plan with the complementary plan of the enterprise in conformity with the principle of production according to sale can bring the superiority of the socialist system into full play in the production and management of the departments of the enterprise.

/2. The enterprise coordinated planned readjustment and regulation by market mechanism by taking the former as the key link, thus utilizing its total capacity and raising profits notably./

Under the guidance of unified state planning, the enterprise energetically used regulation by market mechanism, changed the old practice of "living within the state plan" and revitalized its production and management. The planned supply of sulphuric acid delivered in the early part of 1980 plus the sulphuric acid produced within the plant was less than half of the total needed for production. If the enterprise organized production in accordance with this supply of raw materials, it would have continued to suffer from losses in 1980. To bring about a fundamental change in this situation, the enterprise increased its production of sulphuric acid and organized the labor force and went to the market for raw materials needed to "feed its machines." Second, it established regular contacts with the trades concerned; it formulated and implemented product quantity and quality; it set up monthly, quarterly and annual sales records; it regulated its storage capacity; and it established a communications network with some key sulphuric acid plants inside and outside the province. Third, it provided information on its initiative to the enterprises concerned on its production capacity, the quantities of sulphuric acid and phosphorus ore on hand and its storage capacity and the newly formed communications network. Fourth, the plant reported on market conditions and the request it had made to the higher authorities and integrated the overall balance of the arrangements of the higher authorities with regulation by market mechanism, thus forming two channels of supply for raw materials. Putting the above-mentioned measures into effect, the Jingyang Phosphate Fertilizer Plant established "sister relations" with the enterprises concerned in Beijing, Zhuzhou, Lanzhou and Yumen, and bought from Zhuzhou 2,747 tons of sulphuric acid which was outside the plan. Meanwhile, through the channels of the responsible provincial departments, they bought 5,324 tons of sulphuric acid from sulphuric acid plants in Lanzhou, Baiyin and Yumen. These two purchases were equal to 193 percent of the planned supply by the state or 80 percent of the total output of in-plant produced sulphuric acid. At the same time, together with the Qingping people's commune, the Bangqiao people's commune and Xingyong people's commune as well as the commune-run enterprises, they carried out the practice of "linking up plants with enterprises," signed contracts for replenishing their stock of phosphorus ore and bought 14,500 tons of phosphorus ore. By practicing regulation by market mechanism, production registered an increase of 26,000 tons, comprising 50 percent of the total annual volume of calcium bicarbonate output. The net increased industrial output value was 2.41 million yuan, resulting in an additional 150,000 yuan of profits. The utilization of capacity of the plant was 190.18 percent higher than in 1979.

/3. Enterprise management was rectified and strengthened, sound and normal production order and work were established, thus product quality improved markedly./

Under the unified leadership of the plant's party committee, the job responsibility system was carried out among the plant's party secretary, vice party secretaries, directors and deputy directors to every worker. The system of fixed basic quotas of labor, materials and funds of the enterprise was rectified and perfected, and basic managerial work such as record-keeping, accounting and statistical analyses of enterprise management was rectified and enhanced. Thus normal production order and work were restored and strict enterprise labor discipline imposed.

On this basis, leadership over quality control was intensified and full scope was given to the role of the professional, technical and function departments. By adopting six measures, the rate of high quality calcium bicarbonate was 99.9 percent, an increase of 56 percent over the original plan. A number of products were upgraded to grade-3 products.

/4. Energetic efforts were made to rectify equipment and transform technology, thus the level of technology and the rate of availability of equipment in good condition were raised noticeably./

To cope with the problems of long-neglected equipment, low rate of availability, high rate of leakage, backward technology and techniques, equipment unable to be formed into a complete set and low production efficiency, the enterprise adopted strong measures and achieved good results.

The enterprise firmly grasped the rectification of equipment, formulated a responsibility system for equipment and rules and regulations for preserving and repairing and for operating equipment. The enterprise cleaned and repaired every machine, line, valve and meter according to the standards of equipment issued by the Ministry of Chemical Industry. Of the 332 machines within the whole plant, 262 machines or 84 percent attained the standards of equipment in good condition. The leakage rate of static hermetically sealed points were reduced from 5.5 percent to 3.5 percent.

By utilizing available funds, the enterprise carried out technical transformation of the sulphuric acid equipment and achieved good results, thus enhancing the equipment capacity for producing 7,500 tons of sulphuric acid annually. In 1980, the plant was able to produce 10,235 tons of sulphuric [acid], a gain of 2,735 tons over what had previously been thought of as the equipment's capacity.

SHANGHAI BOOSTS PRODUCTION OF ELECTRIC APPLIANCES

OW270724 Beijing XINHUA in English 0701 GMT 27 Jul 81

[Text] Shanghai, July 27 (XINHUA)--Shanghai, China's leading industrial city, is expected to double the production of television sets in 1985 with an annual output of 1.4 million, the city's Statistical Bureau said.

The city produced 700,000 T.V. sets in 1980 and will produce 900,000 this year.

According to a recent survey of 350 families of various categories conducted by the Shanghai T.V. Set Wholesale Department, there is one T.V. set every two families in this largest Chinese city.

Apart from meeting its own needs, an official of the Statistical Bureau said, Shanghai also supplies its T.V. sets to other parts of the country.

A survey by the bureau indicates a boom in the production of household electric appliances between 1980 and 1985.

The city will produce 1.15 million electric fans this year, an 8.5 percent increase from 1980. The 1985 output will be two to 2.85 million. Almost one-third of the city's families own electric fans.

Output of washing machines will be 40,000 this year, six times as many as 1980. An official of the bureau predicts that the production will probably climb to 350,000 in five years in view of the growing demand.

Shanghai will produce five million radio sets this year, 35 percent more than in 1980, he said. Annual output will remain the same through 1985. At present, he said, 94.3 percent of Shanghai's urban households have radio sets, and half of the city's 1.46 million rural households also have sets.

The increased production will be achieved through new equipment installations and the streamlining of existing enterprises. The goods will be sold both in Shanghai and throughout the rest of China.

Following are the figures for other electric appliances' increases from 1980 and the projections for 1985 output:

Tape recorders: 159,000, down by 27 percent, and a 1985 output of 700,000.

Refrigerators: 7,200, up by 80 percent, and a 1985 output of 20,000.

Electric cookers: 22,000, up by 38 percent, and a 1985 output of 100,000.

Electric razors: 100,000, up by 28 percent, and a 1985 output of 250,000.

Electric irons: 890,000, up by six percent, and a 1985 output of 1.55 to 1.58 million.

Air conditioners: 1,200, up by 38 percent, and a 1985 output of 9,000.

USE OF SICHUAN CIVIL AIR DEFENSE PROJECTS

Chengdu SICHUAN RIBAO in Chinese 8 Jun 81 p 1

[Text] Civil air defense projects have been widely used as production, living and service facilities in Sichuan Province where as much as 287,000 m^2 of space designated for civil air defense have been thus utilized, realizing the benefits of investing in civil air defense projects.

In the famous salt-producing capital of Zigong City, an underground city was built as a civil air defense project with an area comparable to the actual total area occupied by the city's pre-liberation population. This underground city which people have named "the Second City" has a main thoroughfare 10 li long plus factories, schools, shops, exhibit halls, movie theaters, day-care facilities and teahouses. Luzhou City's Anfuzhen used an over 8,000 m^2 civil air defense project to set up an "underground recreation area" with various cultural and recreational facilities complete with restaurants, snack bars, teahouses, photographic studio and specialty shops which provide jobs for unemployed youths. The mountain city of Chongqing, often referred to as a "furnace," uses its civil air defense projects to build a total of eight cold storage houses in caves and increased the city's fresh meat freezing capacity by over 8,000 tons. During the hot summer season, some of the city's theaters, production workshops and conference facilities are set up to utilize the cool air from the civil air defense shelters nearby. In northern Sichuan, the important town of Nanchong uses its civil air defense projects to house a fully equipped 100-bed underground hotel which is very popular with travellers.

INDUSTRY

BRIEFS

GUANGDONG INDUSTRIAL OUTPUT--Guangzhou Municipality scored great achievements in industrial output in the first 6 months of 1981. There was an increase of 8.9 percent in gross output value, of which, light industry increased by 13.14 percent, while heavy industry increased by 1.24 percent. Since 1980, after an industrial reorganization, Guangzhou Municipality has united all enterprises to produce 10 "fist" products and 58 key products. Wristwatches, bicycles and sewing machines increased respectively by 11.49, 14.9 and 15.75 percent. There was an increase in the production of electric fans, washing machines, refrigerators and other commodities. Importance has been attached to readjustment work of heavy industry and key industries; the production structure has been readjusted in the machinery and electrical trades, and service has also improved. Metallurgical and chemical industries have vigorously promoted production of raw materials which are in short supply, thus providing more raw materials for light industry production. In the first 6 months of 1981, the rate of increase of production of collective industries and enterprises in Guangzhou Municipality was higher than that of state-owned enterprises. [HK110712 Guangzhou Guangdong Provincial Service in Mandarin 2330 GMT 3 Jul 81]

GUANGDONG INDUSTRIAL PRODUCTION--Guangzhou, 10 Jul (XINHUA)--Guangdong's total industrial output value for the first half of 1981 rose 11 percent against the same period in 1980. The output value registered by light industry in the province in the period under review increased 16.9 percent from the corresponding period last year. According to incomplete statistics, 524 enterprises in Guangdong have integrated themselves into 129 joint economic businesses in the course of economic readjustment. [OW130555 Beijing XINHUA Domestic Service in Chinese 0131 GMT 10 Jul 81]

GUANGXI TEXTILE INDUSTRY--Over the past 32 years since the founding of the PRC, Guangxi region's textile industry system has steadily increased production by an average of 20 percent a year. From the founding of the PRC to 1980, the regional textile industry system submitted to the state an accumulated capital of 900.8 million yuan, which was equal to 3.6 times the amount of state investments in the same period. The taxes and profits submitted by the regional textile industry system to the state in 1965 accounted for only 2.47 percent of the region's revenue, but the taxes and profits submitted in 1980 represented 12.27 percent of the region's revenue. In the initial period of liberation, the region's textile industry was very backward and the region had only 20 small textile mills with only 260 workers. The total industrial output value was 1.08 million yuan. By the end of 1980, the region had 114 textile enterprises, 63 of which were owned by the state, with 55,000 workers. The total industrial output value was 729.9 million yuan, some 600 times greater than in the initial period. [HK180840 Nanning Guangxi Regional Service in Mandarin 1100 GMT 28 Jun 81]

JIANGSU TEXTILE INDUSTRY--The textile industry of Jiangsu Province overfulfilled its production plan for the first half of 1981. The total output value and the total profits increased by 17.19 percent and 16.48 percent respectively, compared with the same period of 1980. [OW221937 Nanjing Jiangsu Provincial Service in Mandarin 2300 GMT 19 Jul 81]

NEI MONGGOL LIGHT INDUSTRY--By the end of June Ulanqab League in Nei Monggol had fulfilled 61.49 percent of its annual light industrial output value plan. Its light industrial output value was 14.93 million yuan, 41 percent more than in the corresponding 1980 period. [SK222354 Hohhot Nei Monggol Regional Service in Mandarin 1100 GMT 22 Jul 81]

GUANGZHOU LIGHT INDUSTRY--Guangzhou Municipality's total light industrial output value in the first half of this year was approximately 10 percent more than in the corresponding period of last year. The municipality fulfilled some 50 percent of its annual quotas for the production of 32 products of the 40 main products, including sewing machines, bicycles, watches, batteries and soaps. Output of sewing machines, bicycles and watches was from 10 to 15 percent respectively more than in the similar period of last year. [HK110712 Guangzhou Guangdong Provincial Service in Mandarin 1000 GMT 7 Jul 81]

HUNAN INDUSTRIAL MEETING--The Hunan Provincial People's Government on 6 July held a provincial telephone meeting on industrial production, urging the workers on the industrial front of the province to step up the "increase production, practice economy, increase income, reduce spending" movement and strive for better achievements in the second half of this year than the first half so as to realize the target: a 4 percent increase in 1981 industrial output compared with the 1980 record. [OW130555 Changsha Hunan Provincial Service in Mandarin 2300 GMT 7 Jul 81]

TIANJIN EXPORT GOODS--Tianjin second light industrial enterprises produced export goods worth 455 million yuan during January-June period, an increase of 20.55 percent over the corresponding 1980 period. In the last 6 months of 1981, Tianjin Municipality increased 21 export product varieties and signed contracts with countries including Japan, the United States, Canada and West Germany, for processing 24 products with export materials, expecting to earn an extra of 5 million yuan by the end of 1981. [SK192248 Tianjin City Service in Mandarin 0030 GMT 18 Jul 81]

HUBEI POWER LINE--China's first 500,000-volt electric power transmission line crossing Changjiang River was installed on 18 July. It is 600 km long and located between Pingdingshan of Henan and Wuhan of Hubei. [Wuhan Hubei Provincial Service in Mandarin 1100 GMT 19 Jul 81 OW]

HENAN NATIONAL GLASS MEETING--The Ministry of Building Materials and the Ministry of Railways recently held a joint meeting in Luoyang Municipality on packaging and transport of plate glass. The meeting called on the glass factories to reform the backward traditional packaging methods so as to reduce the losses incurred in the course of packaging and transport. FOREIGN TRADE

SHANGHAI PAPER ON IMPROVING FOREIGN TRADE

HK310940 Shanghai SHIJIE JINGJI DAOBAO in Chinese No 9, 29 Jun 81 pp 9, 12

[Article by Ji Chongwei [1323 1504 1218]: "We Should Apply the Theory of 'Comparative Cost' To Guide Foreign Trade"]

[Text] Due to our onetime naive belief in closing the country to international intercourse and one-sidedly placing overall emphasis on self-reliance, for a considerable period of time in our foreign trade workers have become oblivious of the possible advantages that the development of foreign trade can bring to the national economy and to the people's livelihood. At the same time, the guidance of scientific theories has been lacking, and as a result the operation and management of foreign trade have been carried out more or less blindly. The failure to observe economic laws, the total disregard of production costs and forgetting profits and the loss and the neglect of economic results have seriously affected our national economy and the development of our country's foreign trade. The 3d Plenary Session of the 11th CCP Central Committee adopted the important policy of opening up the country economically to international intercourse and decided on the guideline, based on independence and autonomy, self-reliance, equality and mutual benefit, which calls for strengthening contacts with foreign nations both economically and through technology, the vigorous development of foreign trade and the active and reliable utilization of foreign capital and the introduction of foreign technology. All these are necessary measures for speeding up socialist construction.

However, in our foreign trade work, so far we have not had a definite and clear theory to guide us but have adhered to the concept of simply meeting each other's needs. Over many years, our foreign trade constituted the mere exporting of whatever goods were available in the country and the importing of whatever goods the country lacked. We seldom made a study of the conditions of the international markets, or on whether the composition of the commodities for export and import were rational or not, or on how to make use of foreign trade to display the advantages and superiority of our economy and to rectify our deficiencies and drawbacks. In this way, we lacked a correct strategy and policy to develop our foreign trade. In the past, among our country's foreign trade departments and economic theorists, influenced by "leftist" ideology, an important theory which had guided various countries engaging in foreign trade and formulated by the capitalist classical economist David Ricardo, namely, the "theory of comparative cost," was categorically refuted and was labelled as a reactionary theory serving the imperialists' exploitation of their colonies. The theory was thus relegated to the forbidden zone, so to speak. More recently, certain comrades among the theorists have suggested a renewed evaluation of Ricardo's "theory of comparative cost," with a view to absorbing its scientific inner substance to guide our country's foreign trade. I feel that this is extremely necessary and significant.

The "theory of comparative cost," also known as the "theory of comparative benefits," was an important theory brought up by the British capitalist classical economist David Ricardo in the early part of the 19th century when he examined the international division of labor and international trade. According to this theory, a country should export those products whose production it enjoys "absolute advantages" (superior or relative advantages) and import those whose production it is in an "absolutely disadvantageous" or "least advantageous" position. This will be beneficial to the participant nations in international trade. Ricardo's theory was formulated on the basis of the "theory of regional division of labor" evolved by another British capitalist classical economist, Adam Smith. Adam Smith wrote: "If there is any nation that can supply us with certain commodities at lower prices than what we can produce ourselves, then it is better for us to import them rather than purchase such commodities from our departments which are capable of producing them." Nevertheless, while Adam Smith saw that a nation should export those commodities whose production it enjoyed "absolute advantages," Ricardo asserted that if a nation was not in a position of having "absolute advantages" in the production of any two kinds of commodities but used that commodity whose production it had the "lesser disadvantages" of the two to trade with other countries, it would still be beneficial to the two parties concerned. He took for example trade between Britain and Portugal. He pointed out that while Britain produced grape wine and woolen yarn both at a less advantageous condition than Portugal but that if with the two commodities under comparison Britain could produce woolen yarn at relatively lesser disadvantages, then both countries could still benefit if Britain would export its woolen yarn in exchange for grape wine from Portugal.

Over the past 100 years, many capitalist economists have further interpreted the "theory of comparative cost" from various angles but all along they could not divorce themselves from the basic concept of Ricardo's "theory of comparative cost." Following the continual development of the productive force of a society, such factors as scientific technology, enterprise management and culture and education have all played an increasingly important role in the development of the economy and have also become important factors in production. At present, countries in the world are in possession of vastly different kinds of essential factors of production. A nation may enjoy economic superiority in respect of certain production factors but may be in an inferior position in respect to other production factors. For example, the United States enjoys superiority in advanced technology but is in a disadvantageous position because of its high wages. Our country has plentiful labor power and wages are low. This constitutes an advantage but our backward technology and management methods relegate us to a position of inferiority. The merging together of these superior production factors and inferior production factors give rise to the various types of economies now existent in the world, namely, the so-called "labor-intensive" type, "technology and knowhow-intensive" type, "resources-intensive" type, "capital-intensive" type, and so on. The disparity in the production factors and the differences in the types of economies of the various countries provide the basis for the international division of labor and for international trade today. At present, governments of various countries, under the guidance of the "theory of comparative cost" and based on the concrete conditions of their own countries, are devising various kinds of economic and trade policies in an endeavor to strengthen the superior position of their commodities for export and to lessen the advantages enjoyed by commodities in competition from other nations. Enterprises engaging in international trade in various countries are all devoting their utmost efforts to build themselves up into a position of superiority for their commodities, to investigate the conditions of the world markets, to select the best marketing techniques and in this way to formulate theories for "market studies." Under the present condition of large-scale industrial production becoming more internationalized, the "theory of comparative cost" is playing an even greater guiding role than before on the development of the economy and the international trade of a nation. At present, if a country wishes to engage in modern large-scale production, it must participate in the international division of labor and in international trade in order that the raw materials, products, production technology, equipment and capital which large-scale industrial production needs or it has in excess can have the benefit of reciprocal readjustment among the nations of the world. Take for example the case of steel and machine building. Even in countries in Europe and the United States and Japan where the iron and steel industry enjoy great development, they are unable to reach the stage of self-sufficiency in respect to all specifications and varieties of the products. On the contrary, they must, in accordance with the provisions of the law of value, export on the one hand those products possessing varieties and specifications which can demonstrate their countries' production superiority and on the other hand import those products possessing varieties and specifications in the production of which they are in an inferior position. This way of mutual adjustment benefits all countries concerned.

The development of international trade can achieve the objective of rapidly developing the economy of a nation. This theory has passed the test of actual practice in international trade over more than 100 years. Naturally the "theory of comparative cost" also has its serious drawbacks. For example, it prescribes the formation of the international division of labor to principally the differences in natural conditions and overlooks such factors as improvement in scientific techniques, higher standards of management and greater labor efficiency. Moreover, it bypasses the important role played by the trade policies and measures adopted by the various countries on the international division of labor. At one time the "theory of comparative cost" was utilized by the newly risen industrial capitalist class in Britain as basis for the formulation of the free trade policy. However, the imperialist monopoly capitalist class made use of this theory to support their expansionist policy, to set up the colonial system, to make the backward nations bases to supply them with raw materials and markets for the sale of their goods, and to earn high profits by means of this unequal system of international division of labor. This was one aspect of the "theory of comparative cost" as used by reactionary imperialism. But being a scientific theoretical weapon, it can just the same be used by us to serve the independent and autonomous economic policy of our country. We cannot, because it was made use of by imperialism, refute its scientific and rational aspects. If only our country can firmly insist on the guideline of independence, autonomy, equality and mutual benefit, put foreign trade under unified management and control, and fully display the superiority of socialism, we can still make use of the rational inner substance of the "theory of comparative cost," and actively take part in the international division of labor. Our country enjoys many advantageous conditions such as bountiful natural resources, plentiful labor power, low wages, and an established industrial foundation. Of course, there are also certain disadvantageous conditions, such as our scientific technology and standard of management not being very high, the low level of industrial organization and mechanization, low skills and the low efficiency rate of labor, and certain administrative systems and regulations actually hindering the development of foreign trade. We must give full play to our advantageous points and minimize the disadvantageous points. We must investigate and conduct research on our export and import commodities and the international markets, and make a thorough study of them. We must clearly ascertain the demands and trends of development of the international markets. In regard to each export commodity, we must find out its foreign exchange earning rate, the costs involved, and the general state of profits and losses. As for those commodities in the export of which we command absolute advantages such as handicrafts and certain special subsidiary agricultural products, we must put in full play all the advantageous factors and satisfy the needs of the foreign markets. Take for example the drawn work products of our country. They require the type of labor which can be done by female workers in the rural villages. The production costs are low. The foreign exchange rate is roughly 2.78 yuan to $1.00. No other country in the world can compete with us in this area. In recent years, the annual increase in the export volume of this commodity was from 20 to 30 percent, and last year the gross value of its export volume reached $400 million. Over 3.5 million people in the 20 provinces and municipalities of the country now depend on this commodity for a living. It is thus a commodity with an extremely good future. We must therefore develop it in a planned manner and with due consideration to the needs of the international markets. Take another example such as woolen knitwear in the markets of the United States. The selling price is roughly $28 per piece in the United States. In our country, the wages for machine-knitted woolen wear averages only 0.7 to 0.8 yuan per piece, whereas in Europe and in the United States the wages for workers making woolen wear are much higher. More or less the same conditions apply to other labor-intensive commodities such as clothing and shoes. Our country has plentiful coal deposits. An initial estimate places our deposits at some 600 billion tons. At present, the cost per ton is only 20 to 30 yuan, but in the international markets the price of coal reaches $50 per ton. Even taking into account the high transport charges involved in the export of coal, its export is still a profitable trade. As for tungsten ore, the purchasing price in our country is over 8,000 yuan per ton but the international price is over $9,000 per ton, and it can sell for more if the degree of purity is higher. For this reason, we should strive to export more labor-intensive and resource-concentrate types of goods. Our machine-building industry has already been provided with some definite groundwork. Some of the machine products are both technology-intensive and labor-intensive and it is more profitable to export them. The precision grinders made by the Shanghai Machine Tools Plant are good in quality and the production costs are about 10,000 yuan each, but they sell at more than $10,000 each in the United States. Again, take for example electronics products. They consume much labor in their making. At present, many plants in our country are doing the fitting and assembling work of electronics products for plants abroad, using parts and materials supplied by them. If we can organize well the production of the specialized elementary parts, then there are good prospects in the future for the development of the export trade in the categories of electric goods for civilian use.

In general, it must be said that in the case of those commodities in the exportation of which we are in a relatively advantageous position, if only we can devote efforts to improving them, playing up the good points and minimizing the weak points, then we will have the means for greater development. In the case of certain commodities such as glassware, they consume much fuel in their manufacture, have high production costs, require a nearly 40 percent of markup in the selling price to cover transportation costs and generally speaking, the overall procedure to acquire foreign exchange earnings from this commodity requires much effort and expense. Hence, we should limit the export of this commodity. As for these commodities that are imported, there are also the problem of playing up the strong points and minimizing the weak points and that of improving their composition. In recent years, among the commodities imported by us, agricultural products and industrial raw materials such as grain, cotton, sugar and chemical fiber have greatly increased in proportion. In particular, the proportion of imported materials reexported after processing made up 42 percent of the total volume of export trade last year, whereas the proportion of industrial commodities imported such as steel products, chemicals and machines declined. Under the present condition of agriculture not being well developed and the shortage of grain in the country, the importation of more grain is necessary and is worthwhile. This is because that from the standpoint of international prices of various kinds of agricultural products, the cost of grain in the United States and Canada is lower than that of the economic crops on account of grain being suitable to large-scale mechanization. Therefore, the current guideline of importing grain and planting more economic crops is a correct one. However, as for such economic crops as cotton, sugar and tobacco, since their international prices are high and their importation involves huge subsidies from the state, we must produce more of them in the future and strive for self-sufficiency by gradually reducing, and eventually ending their importation. A certain comrade has investigated the prospective profits and losses if we were to trade the agricultural products from Shanghai's suburban farms in the international markets. It was found that in the United States the price of 1 jin of wheat was about 8 cents and that of 1 jin of green pepper was 75 cents. In Shanghai, the price of 1 jin of wheat was a little over 0.1 yuan, while at the peak production period, 1 jin of green pepper could sell for only 0.02 yuan. Thus, 1 jin of green pepper from Shanghai could fetch nearly 10 jin of wheat in the United States. An American friend therefore asked: "Why don't you people trade these kinds of vegetable crops for wheat in the international markets?" It was estimated that in Shanghai's suburban areas, calculated in international prices the planting of 1 mu of wheat can earn an income of $32; planting of 1 mu of green sword beans can earn $264 and planting of 1 mu of garlic can earn an income of $600. Therefore, would it not be feasible for us to plant in the coastline areas and towns more of economic crops such as vegetables and fruits which are needed in the international markets and, after processing, export them in exchange for more grains? This indeed is a topic of research on the application of the theory of comparative cost to guide us in the reform of the composition of our export trade.

Below I would like to discuss the relationship between profits and losses in foreign trade and the policy governing the import and export commodities. This is because this problem influences all aspects and is also extremely complicated. Comrades engaging in foreign trade and in industrial or financial work and those in economic theoretical work are all concerned about it. It is necessary for us to examine both theory and practice to find out the real substance of the contradictions before we can find the right direction to solve the contradictions.

Since 1953, the foreign trade of our nation has been under state monopoly and both import and export trade have been under the unified control and management of the foreign trade departments. Because of the low foreign exchange rates of our currency, over the years profits were made in import trade while losses were incurred in export trade. The Ministry of Foreign Trade made the necessary readjustments in a unified manner and profits were used to make up the losses. In short, the practice of meshing together was practiced in foreign trade. At the time of the Great Cultural Revolution, even customs duties were abolished, under the pretext of "melting taxes and profits in the same pot." Over a period of 28 years, the Ministry of Foreign Trade reported profits for 19 years and losses for 9 years. In 1980, the separation of taxes and profits was made and remittance of customs duties alone amounted to about 3 billion yuan. Consequently, foreign trade operations shifted from making profits to suffering losses. This year, in order to encourage exports and discourage imports, a system of "internal conversion" of foreign exchange in foreign trade was adopted by means of which the exchange rate of $1.00 equaling 1.6 yuan was changed to $1.00 equaling 2.8 yuan for purposes of internal settlement of accounts. As a result, import trade was changed from making profits to incurring losses while the reverse was true in the case of the export trade. This of course applied to the overall rendering of accounts. In the case of individual commodities, due to the differences between the domestic prices and the prices abroad, profits were shown on certain imported commodities such as wristwatches, television sets, synthetic fibers, rubber and so on. At the same time, of the commodities of export, over 30 percent, comprising mainly industrial goods, still incurred losses of some kind. Some loss ratios amounted to 50 to 60 percent. According to estimates made by the Ministry of Foreign Trade, this year the losses incurred in import trade will reach over 10 billion yuan. The principal reason for this is that over the years the international prices of many commodities have been steadily rising whereas the prices fixed for them in domestic transfers in our country have remained stationary. As a result, huge subsidies had to be disbursed by the state. Take for example the case of imported wheat. In 1971, the purchase price was $64 per ton. By 1981, it had risen to $223, the equivalent of 724 yuan. However, the domestic transfer price is only 326 yuan, or a loss of nearly 400 yuan per ton. In 1971, the price of chemical fertilizer was $35 per ton; in 1981, it went up to $116 per ton, which was the equivalent of 325 yuan. In China, the domestic settlement price was only 173 yuan, a loss of over 150 yuan per ton. Similarly in the case of cotton, its price in 1971 was $832 per ton but went up to $1,956 per ton in 1981. The latter was over 5,470 yuan, but the domestic settlement price was only 2,658 yuan and a loss of 2,800 yuan per ton was thus incurred. More or less the same conditions applied to sugar and agricultural chemicals. Over the past 10 years and more, the international prices of commodities have gone up several times but the domestic prices in our country have not changed at all. Among the commodities for export, this year crude oil and petroleum products will bring profits amounting to 7.6 billion yuan as a result of their prices rising steadily in the international markets but remaining unchanged in the domestic market. As for agricultural subsidiary products and mineral ores, their foreign exchange acquisition cost was about 1 to 2 yuan to $1.00. In general, they were profit-making commodities for export. However, the expenses incurred in acquiring foreign exchange earnings from exported industrial products ranged from 2 yuan to 4 or 5 yuan per $1.00, and were the main (?reason) for the losses in foreign trade. Averaging the accounts, this year a deficit of about 1 billion yuan will probably be incurred in export trade and, according to estimates made by the Ministry of Foreign Trade, this year the overall picture will show a net deficit of 6 billion yuan in foreign trade. However, since the budget of the Ministry of Finance provided for a net deficit of only 4 billion yuan for foreign trade, this will be the cause of serious contradiction and dispute between the relevant departments. The situation appeared to be that in order to stabilize the domestic market and maintain industrial and agricultural production, certain material resources must be imported, but the selling price cannot be raised and among the industrial commodities of export, making many losing propositions. In the past, the Ministry of Foreign Trade handled all foreign trade affairs alone and was responsible solely for the profits and losses. It needed only to report the net results to the Ministry of Finance. Actually, there was no auditing of accounts. Many commodities which incurred heavy losses in their export and should not have been exported were exported just the same and many substandard and very expensive goods were bought in large quantities, to be subsequently stockpiled in the warehouses. Such a state of affairs will no longer be tolerated. Since the state cannot stand to continue to absorb losses resulting from the purchases of commodities, the way out is to restrict their purchases or to purchase them only at lower prices. This again causes disputes between the industrial and trade departments. In domestic marketing, it is easy to handle those commodities whose supply falls short of demand, but in the case of those commodities whose supply exceeds demand and which must be exported, failure to export them will result in the stopping or reduction of their production in which case workers will be idled and there will be reduced receipts in taxes and profits for the Ministry of Finance. For this reason, many industrial departments have sharply criticized the policy of "subsidizing and encouraging imports and reducing the purchase prices of export commodities or restricting their export." In order to reduce the anticipated deficits, this year the scale of purchases of commodities for export and, in fact, the entire export plan are below last year's level. Meanwhile, a recession in export trade will adversely affect the foreign exchange position of the state and in the event of the foreign exchange earnings failing to meet the foreign exchange payments and the widening of the adverse balance in the foreign exchange position of the state, then imports will eventually be adversely affected.

The causes for such a situation are complicated ones. First of all, our price system and price level formulated over the past 20 to 30 years were at great variance from the international level. International prices have been increasing at an average rate of 10 percent every year but the domestic prices in our country have basically not been changed. This had one good point and this was the maintenance of price stability, but it resulted in huge financial subsidies being paid out by the state and this was not a very sound base. Besides, the burden tends to become increasingly heavy as time passes and it may not be possible to keep the process going indefinitely. Second, we fixed our trade internal settlement prices on the basis of the average cost of export commodities last year with a certain amount of profits added to every 2.5 yuan of the average cost. But there are thousands of kinds of commodities being exported and the disparity between their domestic purchase prices and their marketing prices abroad is very great. In general, the expenses incurred in acquiring foreign exchange earnings is low in the case of primary raw materials such as subsidiary agricultural products and mineral products. For example, the breeding of cultured pearls costs only 0.8 or 0.9 yuan to acquire a foreign exchange earning of $1.00 and similarly the expenses incurred in acquiring foreign exchange earnings from coal is only several jiao for every dollar. In the case of industrial products, the foreign exchange acquisition cost is much higher. For example, in the case of light industrial products last year, the average expenses incurred in acquiring foreign exchange was 3.91 yuan for every dollar and as a whole the resulting deficit incurred by the state was over 2.8 billion yuan. It was found that of the light industrial products, at least 17 of them incurred expenses of more than 5 yuan for every dollar. The causes of such deficits may be ascribed in part to various factors in both the production and circulation factors such as poor management and operation, production and marketing being out of joint, the products being unmarketable, poor quality of the products, the variety and specifications of products being antiquated, poor packaging, and so on. Even for the same kind of commodity it was found that the labor volume expended in production and circulation in the country was frequently higher than the average labor volume required in the world. At the same time, these products required great quantities of raw materials and energy. They had high production costs, were unable to fetch good prices, and generally lacked the competitive edge. Due to the system of "meshing together" or "eating out of the same pot," in foreign trade management and control no responsibility system was in force while the inefficient marketing methods brought about a heavy stockpiling of goods in warehouses, a slow turnover of funds and much extravagance and waste. All these deficiencies need to be rectified in our work. At the same time, many commodities for processing have likewise brought about losses in foreign trade, due to the imposition of taxes at each stage of processing, the resulting markup at each and every process stage or, generally speaking, the industrial profits being fixed at too high a level. For example, the importation of polyester-cotton blend fiber for processing into textiles for reexport normally should be a profitable trade and could earn foreign exchange earnings as well as renminbi. But because of the imposition of profit charges and the taxes levied at each stage of processing, it has been turned into a commodity which incurs heavy losses. Last year, imported polyester-cotton blend fiber cost $1,500 per ton. Adding 40 percent customs duty and adding the percentile trade surcharge, the cost figure was raised to 3,500 yuan. Upon delivery to the Ministry of Textile Industry, the price charged was 8,500 yuan per ton and when the ministry turned it over to the textile plants the price was 11,000 yuan per ton. In this way, even before any processing work was done on the raw material, these several intermediary links had already added on taxes and profit charges amounting to 8,660 yuan. Following commencement of production, at each of the processing stages, spinning, weaving and dyeing, a profit allowance of around 20 percent was added on. In addition, there was a tax levy of 29 percent and if the resultant product was made into apparel for export, an additional tax levy of 5 percent was imposed. This succession of tax levies and profit charges caused the deficit incurred by the trade department on this commodity alone to reach as high as 70 to 80 percent. Since last year, relevant government departments have studied this problem and planned to solve it by reducing the tax levies and the profit charges. At the end of last year, the State Council issued an order on the reduction or exemption of tax levies on commodities for export. Unfortunately, whenever the reduction of financial receipts was concerned the question invariably arose as to who was to be the party to bear the financial loss, whether the central government or the provincial governments. And this problem has defied solution. In my opinion, in order to develop foreign trade, we must start from the standpoint of macroscopic economics and, taking into consideration the whole interests of the state, study which commodities should best be exported and which imported in order better to accelerate the development of the national economy. Concerning the exportation of products beneficial to the national economy we must adopt a series of policies and measures of encouragement. As for imports, we must take into account the supply and demand relations at present and in the future and, following the principle of safeguarding the development of the national industries, study which commodities should be banned from import, which commodities whose importation should be restricted, which commodities the importation of which should be gradually reduced, and which commodities the raw materials of which can be imported for the purposes of processing, manufacturing or assembling of the finished products in our country. In the case of such equipment or key parts of machines (such as the important and essential parts of machinery equipment, automatically controlled equipment, and so on), which we cannot manufacture or which we can manufacture but the quality of such products is poor and they entail high production costs, and if it is found more profitable to import such advanced products from abroad rather than undertaking trial or limited production of the products ourselves, then we should by all means encourage their importation. Only in enlivening export trade under the guiding principle of benefiting economic development and playing up the good points and improving on the weak points can we speed up the readjustment of our economy and the construction of the four modernizations.

In the implementation of these measures, comrades of the various departments, localities, enterprises and financial or taxation departments should take a broad vision. They should take into due regard the interests of the country as a whole and not be shortsighted or only care for the interests of their own departments or enterprises. They should not take temporary advantages in matters of either finance or taxation or be unyielding or insist on playing their own game and generally behave in such a way as to impede the solution of the contradictions or hinder the normal development of foreign trade, which in effect would be impeding the development of production. As for those products which normally incur losses or deficits, a concrete analysis must be made of the real factors concerned and if it is found that their exportation is beneficial to the state, then in addition to lowering the production cost in both the production and circulation sectors, the financial departments should reduce the tax levied on them, the industrial departments concerned should be satisfied to work on the principle of "a small profit but a large output," while the foreign trade department in turn should bear a portion of the deficits. Only in this way can the policy of encouraging exports be implemented. More recently, Shanghai solved the problem of the exportation of half a million sets of rubber ties mainly through the three parties concerned making the necessary concessions. In the last analysis this means that the state benefits while the industrial, trading, financial and taxation departments are all fulfilling their tasks.

In order to make further contributions to the tasks of developing our country's foreign trade, readjusting the economy and constructing the four modernizations, we have yet to perform a series of big and important tasks, these including reforming the foreign trade control system, improving the composition of the import and export commodities and organizing ourselves into a united front to deal with all external affairs. Among these tasks, there is a key and important link which is that we must positively reform and improve, that is, the management and operation of the industrial and foreign trade enterprises in order to make our export products marketable, of good quality and incurring a low production cost since only then can they compete in the international markets. In this regard, a great deal of investigation and research work has yet to be done. It is hoped that those comrades engaged in both the theoretical and practical work on the problem of production costs will deepen their studies and play a leading and promotional role.

FOREIGN TRADE

BRIEFS

GUANGDONG MUNICIPALITY ECONOMIC CONSTRUCTION--The area of the Zhuhai Municipal Special Economic Zone is 6.81 square kilometers and is being used to develop tourism, residential housing and electronics, light and textile industries. Before the establishment of the municipality, the municipality's annual industrial output value was only some 38 million yuan. Over the past 2 years, the municipality has manufactured and processed some 130 products and built a large number of new enterprises which do processing work with materials supplied by foreign firms and new assembling enterprises. The municipality's total industrial output value in 1980 was 81 percent more than in 1978. The output value of the enterprises which do processing work with materials supplied by foreign firms accounted for 42 percent of the total industrial output value. The municipality's foreign exchange earnings in 1980 were some $37 million, double the 1978 figure. The per capita income of rural commune members in 1980 was 234 yuan, some 50 percent more than before the establishment of the municipality. The municipality has invested some 70 million yuan in capital construction, eight times more than in 1978. [HK230200 Guangzhou Guangdong Provincial Service in Mandarin 2330 GMT 15 Jul 81]

SHENZHEN SPECIAL ECONOMIC ZONE--In the first 3 months of 1981, the Shenzhen Special Zone imported more than HK$538.37 million of foreign investment, up 55.4 percent compared with the corresponding period last year. Since the beginning of 1981, Shenzhen has made good progress in importing foreign investment. From January to March, 86 contracts for investment of various types were signed with merchants, 71 of which have already been put into production. Imported items include industrial, agricultural, pastoral, tourist, housing, transport, hygiene and cultural trades. They are imported in the form of industrial processing using imported materials, joint ventures, cooperative production, and running businesses with one's own funds. [HK030929 Guangzhou Guangdong Provincial Service in Mandarin 1000 GMT 21 Jun 81]

JAPAN OLYMPUS COMPANY EXHIBIT--Beijing, 8 Jul (XINHUA)--An exhibition on precision and optical instruments sponsored by Olympus Optical Company, Japan opened at the Beijing exhibition centre here today. It will last for 10 days in Beijing. On display are medical fiberscopes, microscopes, cameras, micro cassette tape recorders, copying machines, precision measuring, analytic and audio equipment and other optical instruments for medical use. The Olympus Optical Company had previously joined other Japanese firms in sponsoring exhibitions in China and established business relations with Chinese trading firms. Mr Shigeo Kitamura, president of the Olympus Optical Company, and Wang Wenlin, vice chairman of the China Council for the Promotion of International Trade, spoke at the ceremony. BRIEFS

HUNAN HIGHWAY CONSTRUCTION--The party and government in Hunan Province have promoted construction of highways since the founding of the People's Republic of China. The total length of highways in the province is now more than 54,000 kilometers, almost 13 times that of the preliberation period. The highways now handle some 150 million dun of freight transportation annually against 70,000 dun in the initial period after liberation. GENERAL

BRIEFS

GUANGDONG TOURISM--As the policy has been relaxed, the number of tourists entering and leaving China through Luohu has increased in the past few years. According to statistics, in 1978, 3,110,123 tourists entered or left China through Luohu; the 1979 figure was 5,902,490 border-crossing, an increase of 83.7 percent compared with 1978. In 1980, the figure reached 6,919,425, an increase of 17.2 percent compared with 1979. [HK060632 Guangzhou Guangdong Provincial Service in Mandarin 1000 GMT 22 Jun 81]

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Indexes to this report (by keyword, author, personal names, title and series) are available from Bell & Howell, Old Mansfield Road, Wooster, Ohio 44691.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

Lowering Energy Consumption

Beijing RENMIN RIBAO in Chinese 21 May 81 p 5

[Article by Lei Xilu [7191 6932 4389]: "Lowering Energy Consumption as a Strategy of Economic Readjustment"]

[Text] Energy resources constitute the important material foundation for the development of social production and improvement of people's lives. The development of China's energy resources has advanced rapidly since establishment of the nation. In 1979 the total energy production (including coal, oil, natural gas and hydroelectric power) was equivalent to 640 million tons of standard coal, which was 11.4 times that in 1953, amounting to an average annual growth rate of 10.1 percent. However, the energy supply has registered a significant shortage in recent years and has been insufficient to meet the needs of national economic development, so that the industrial production capability could not be fully developed and this resulted in a heavy economic loss. Therefore, insufficient energy has rapidly become a key question related to development of the national economy. What are the major causes of energy shortage? How do we solve the problems of energy shortage? This article will discuss these problems.

Large Energy Consumption Is One of the Major Causes of Energy Shortage in China

Energy consumption has increased very rapidly in China since the establishment of the nation. In 1979 the total energy consumption was equivalent to 586 million tons of standard coal (referring to commodity energy only, excluding noncommodity energy such as waste matter and wood used in rural villages), which was 9.8 times of that in 1953. It was the third largest energy consumption in the world, exceeded only by the United States (2.502 billion tons) and the Soviet Union (1.445 billion tons).

China's energy consumption was greater than that during the period of the first 5-year plan and much greater than in foreign countries. For example, in 1979 the consumption of standard coal per 100 million yuan of national income was 174,000 tons, a 98.5-percent increase over the average of 91,800 tons during the period of the first 5-year plan and a 27.9-percent increase over the 136,000-ton consumption in 1965. Comparing the energy consumption in China with that in foreign countries: in 1978 Japan's energy consumption was 77.2 percent of China's and its national income was 4.6 times that of China; the total U,S. energy consumption was 4.4 times China's and its national income was 10.9 times; the total Soviet energy consumption was 2.5 times and its national income was 3.2 times; and the total energy consumption of West Germany, England, and France was 64.9, 51.1 and 42 percent of China's, respectively, and their national incomes were 3.2, 1.6 and 2.4 times that of China, respectively. Calculated on the basis of energy consumption (in terms of standard coal) per $100 million, China's energy consumption was the highest of all.

Let us further compare China's and Japan's energy consumption and the production of a number of major products. In 1978, Japan's total energy consumption was 439 million tons of standard coal, amounting to only 77.2 percent of China's, while Japan's steel production (102.11 million tons) was 3.2 times that of China, automobile production (9.27 million vehicles), 6.5 times; electric power generation (495.2 billion units), 1.9 times; and tractor production (310,000 vehicles), 1.9 times. The energy consumption and the production of a number of major products in the United States, the Soviet Union, West Germany, England, and France compared with China's were approximately the same in scale.

The Major Causes of High Energy Consumption in China Today

1. Low Energy Utilization Rate. Energy consumption consists of two major parts: one part effectively utilized and one part wasted. The effective utilization rate of energy in China is only 28-30 percent, and the rest, 70 percent or so, consists of waste heat and loss. The effective utilization rate of energy in Japan is more than 50 percent, and in the European Community nations, 42 percent or so. If China's energy utilization rate could be increased from the present 28 percent to the level of Japan today, approximately 200 million tons of standard coal could be saved a year.

The reasons why China's energy utilization rate is so low include the following:

First of all, the standard of energy management is low, with consequent serious energy waste. Due to neglect and a low standard of management, the loss of gas, water, and oil due to leakage is a common phenomenon in the vast majority of plants, and loss of electric power and thermal power is also significant.

The unit energy consumption of 38 kinds of major products during the first 6 months of 1980 as determined by a national survey was found to be below 60 percent of the best historical level. The difference in energy consumption among different enterprises of the same occupation is also quite large. For example, among China's 50 medium-size chemical fertilizer plants, the average coal consumption per ton of synthetic ammonia was 2.77 tons for the period January-May 1979. Among them, the Quzhou Chemical Fertilizer Plant in Zhejiang Province consumed only 2.214 tons. If all other plants could reach the standard of the Quzhou Chemical Fertilizer Plant, 1.8 million tons of coal could be saved a year.

There are as many as 4,000 heat-treatment factories and construction sections among 6,000 enterprises belonging to the First Ministry of Machine Building system, with a total electric furnace capacity of 1.34 million kW. Some plants use these facilities less than once every 2-3 days, wasting a large amount of electricity. If these plants could be reorganized to take advantage of cooperative ppecialization, the number of heat-treatment factories (or construction sections) could be reduced more than 50 percent and a large amount of energy could be saved.

Second, energy resources have not been systematically utilized. Generally speaking, the most efficient way is joint thermoelectric application--generating electricity first, supplying heat later. The waste heat and the coal gas produced as a byproduct of industrial production have not been sufficiently utilized. According to a preliminary estimate, the nationwide usable industrial waste heat amounts to 50 million tons of standard coal, and only about 10 percent of it is being utilized today. The coal gas generated from the blast furnaces and coke furnaces in China's key steel enterprises amounts to approximately 8.7 billion cubic meters a year and the oil field gas generated by the oil industry reaches 5 billion cubic meters a year. These gases are not utilized, and this is equivalent to a loss of 2 million tons of standard coal or 2.8 million tons of raw coal a year.

Third, outdated technology and equipment constitutes another very important reason why China's energy utilization rate is low. According to a preliminary study of more than 26,000 different kinds of electromechanical products manufactured by plants belonging to the First Ministry of Machine Building, 55 percent are 1940-50 models, and 3,200 kinds of popular products are manufactured in large quantities which are known to consume a large quantity of energy and are low in efficiency. The domestic internal combustion engines consume 10-20 percent more fuel than the foreign made, thus wasting more than 3 million tons of oil a year. The efficiencies of various kinds of machinery and pumps are on average approximately 10 percent lower than the foreign made, thus wasting more than 10 billion units of electricity a year. The thermal efficiency of the existing 180,000-190,000 industrial furnaces is only approximately 50 percent, consuming approximately 200 million tons of coal a year. Compared with the thermal efficiency of 70-80 percent achieved by the industrially advanced nations, China is wasting 30-50 million tons of coal a year.

Fourth, irrational distribution and utilization of energy creates large waste. For example, railroad locomotives should use lump coal or molded coal, but raw coal is being used today. As a result, the loss rate is 7 percent more than if lump coal or molded coal were used. Chemical fertilizer plants should use medium lump anthracite, but what is supplied to the plants today consists for the most part of unsieved, small lump coal, with an increase in consumption of 25-30 percent, amounting to a waste of more than 5 million tons of coal a year.

2. Irrational Economic Structure

The structure of the national economy has a great effect on energy consumption. Within the national economy, industrial circles consume the most energy, especially the metallurgical and chemical fertilizer industries. The light industry and transportation sections consume less energy, and the agriculture, commerce, services, and travel consume the least energy. One of the important reasons why China's energy consumption today is greater than during the period of the first 5-year plan and the period of readjustment from 1963 to 1965 is the fact that heavy industries which consumed great amounts of energy were developed too fast. For example, between 1953 and 1979, the average annual growth rate was 10.1 percent for energy, 12.7 percent for the metallurgical industry, and 17.7 percent for the chemical industry, including 26.6 percent for the chemical fertilizer and pesticide industries. The specific weight of heavy industry among all industry increased steadily. A larger part of China's energy resources is consumed by heavy industry today because of its disproportionately large specific weight. For example, in 1979, 28 percent of the national income was contributed by heavy industry, which was responsible for approximately 60 percent of the total national energy consumption. On the other hand, 18 percent of the national income was contributed by light industry, which was responsible for only 10 percent of the total national energy consumption. Thus, the limited amount of oil was not properly utilized to achieve the maximum economic effect.

Since the readjustment of the proportional relationships was started in 1979, its effect on energy conservation has already been seen. Comparing 1980 with 1979, the specific weight of light industrial production in the total industrial production increased from 43.1 to 46.9 percent. And 22 million tons of standard coal were saved as a result of this measure and the reorganization of the products structure within the industry. Based on a rough estimate, 6 million tons or so of standard coal could be conserved for every 1 percent rise in the specific weight of light industry in the entire industry. Therefore, a systematic and gradual increase in the specific weight of light industry is an important effective measure to decrease the energy consumption level.

3. "Five Small" Enterprises Consume Too Much Energy With Much Waste

In 1979, medium and small enterprises occupied 99 percent of China's total industrial enterprises and produced 56 percent of the total industrial output. At present, most of these small enterprises consume too much energy and account for a great deal of waste. In the field of metallurgical industry, the energy consumption per ton of pig iron by medium- and small-scale enterprises was more than 100 jin more than the key iron and steel plants, thus wasting more than 1 million tons of standard coal a year.

In the field of chemical industry, the synthetic ammonia industry consumes 50 percent of the energy. Large plants imported from abroad using oil and gas as raw materials consume on average 1.43 tons of standard coal per ton of synthetic ammonia, while the small ammonia fertilizer plants using mainly coal and coke as raw materials consume 3.71 tons of standard coal per ton of synthetic ammonia. The small enterprises thus waste more than 10 million tons of standard coal a year compared with the usage of the large imported plants.

Energy Conservation Is an Important Means of Solving the Energy Shortage

The measures to solve the energy shortage problem consist of development and conservation. During the period of readjustment, conservation is more important.

During 1980, while the energy supply decreased 2.9 percent, industrial production increased 8.7 percent. This feat was accomplished mainly by energy conservation. During the period of the sixth 5-year plan the total supply of energy is expected to decrease further, so if we want to maintain a steady rate of national economic growth we must work harder on energy conservation. During the period of readjustment and for an even longer period afterward, we must make energy conservation one of the key measures for the development of the national economy. We must carry out technological renovation and structural reconstruction of our national economy centered around energy conservation and aggressively fight the battle of energy conservation.

Among various energy conservation activities, conservation of oil has even greater significance. Today, when there is a shortage of oil supply in the world and the oil price is rising rapidly, every country attaches great importance to oil conservation. In 1979, 84 percent of China's crude oil production was consumed domestically with great waste. How effectively we can utilize this amount of oil has a profound significance. If we can conserve 10 million tons of oil by any effective conservation measure and export that oil, we will be able to earn more than $2 billion in foreign exchange, which can be used to import facilities and technologies which are urgently needed by the national construction. This will have a significant effect on China's realization of the "four modernizations."

During the past 2 years, the energy conservation efforts exerted by everyone, from the party Central Committee to the local district, have already shown some definite results. But this is only the beginning. There is still a great latent potential for further conservation.

What measures of energy conservation should we emphasize? Based on the experiences gained by the domestic advanced energy conservation units and thos of foreign countries, we must emphasize activities in the following areas:

First of all, we must strengthen the ideological work. The energy situation must be explained and various forms of wasting energy must be presented to the workers and the people, and then the methods of solving these problems must be explained to them. Everybody must be made to understand the close relationship between energy conservation and China's "four modernizations" construction and also the effect of energy conservation on improving and raising the national standard of living, so that he will willingly practice energy conservation.

Second, energy management must be strengthened. The energy management structure must be established and strengthened from top to bottom. So that energy management, distribution, and utilization can be governed by short-range as well as long-range energy conservation plans, measures, guidelines, and policies must be drawn up and implemented systematically. Each year the government must publish the goals and tasks that are expected to be accomplished by each department, district, and enterprise. The government must implement a measure on supplying energy to enterprises according to a norm in exchange for a coupon, and likewise from the enterprise to its factories. After the basis of norm management is well established, we must gradually experiment with a fixed amount of energy undertaking. Excess use of energy will not be replenished, or it will be replenished at an added price. We must establish a system of post responsibility so as to eliminate completely the loss of thermal energy, waste of electric power, and loss of gas, water, and oil due to lack of a sense of work responsibility. Energy conservation must be made one of the items on which an enterprise is evaluated. It must be made part of the routine; it must be systematized and popularized.

Third, new technologies, new materials, and new experiences related to energy conservation must be pursued and developed aggressively in order to raise the standard of energy conservation. Any new technology, new material and new experience acquired by any enterprise must be expanded and applied to its production process and to the renovation of energy conservation measures. Relatively inexpensive and simple measures with mature technology from which quick results can be obtained must be popularized first of all. Those measures which are more complex and more expensive and require a longer period of reconstruction must be popularized gradually after experimenting with them.

Fourth, the outdated facilities and technologies must be renovated with energy conservation as the central theme, and old facilities which waste too much energy should be eliminated gradually. At the same time, research and trial construction of high-efficiency energy-saving equipment must be pushed forward aggressively.

Fifth, the economic structure must be reorganized one step further. During the process of reorganizing the economic structure, we must accelerate the development of those sections which consume less energy, including agriculture, light industry, commerce, services, travel, and construction industry, so that their specific weights in the national economy will be increased further. Thus, not only will energy be significantly conserved but also the market will be stabilized, people's lives will be improved, and financial income will be increased. While the economic structure is being reorganized, the products structure within enterprises must also be reorganized. Those small enterprises which waste energy, have large losses and produce low-quality, unattractive products must be systematically reorganized.

Sixth and last, economic policies related to energy conservation must be researched and developed, especially economic policies which will promote conservation of oil and reduce the use of oil for fuel.

In addition, the development of methane gas, forest for firewood and charcoal, small hydroelectric power generation, renovation and development of small coal mines in rural areas, together with utilization of solar energy and wind power, are all effective measures for solving the problems related to energy shortage.

Resource Measurement, Testing Work

Fuzhou FUJIAN RIBAO in Chinese 11 May 81 p 2

[Article by Cao Jichuan [2580 1323 1557], deputy director of Fujian Province Survey Bureau: "Stressing Energy Resource Measurement and Testing Work"]

[Text] Conservation is an extremely important task in the period of national economic readjustment. To a large extent, the effectiveness of conservation has an effect on the speed of economic development in Fujian Province, and the conservation effort must succeed. In the effort to conserve energy, if the method of measurement is not stressed or if the measurement methods used are not accurate, then just general talk about stepping up management will not achieve the required conservation.

Measurement and testing are the basic techniques in energy resource management. Over the years, the testing and measurement work at Fujian's factory and mining enterprises has been rather weak. Among the 11 large enterprises in the province, only 4 have established a measurement department. In some plants, although there are measurement departments, they are not in charge of the general measurement work of the entire plant. In other cases, the measurement departments are short of manpower, have too many new members and obsolete equipment and apparatus. Today there are a number of plants, mines, harbors and stations in Fujian where the incoming and outgoing amounts of coal, oil and electricity and the energy consumption within the plants and mines generally lack accurate measurement. In some cases, the accounting with regard to electricity, oil, coal and gas is a complete mess. With such confusion in energy consumption, it is difficult to evaluate the conservation or waste of energy resources. Just a 1-percent error of 5 million kilowatt-hours is equal to 50,000 kilowatt-hours! If these conditions are not improved, conservation work undoubtedly will be adversely affected.

To solve the problem of measurement and testing for large energy consumers, the first step is to install the proper meters and equipment according to the needs of the profession and enterprise. In June 1980, the State Economic Commission held a work conference forum and decided to complete the installation of measurement equipment and meters and testing procedures for the nation's large- and medium-scale enterprises within a period of 2 years or so. It was also decided that in the future, energy resource supplies will be restricted at those enterprises.without complete measurement equipment, meters and testing procedures. Such enterprises will not be regarded as progressive, and in the event of an energy resource dispute, they will have to assume the economic responsibilities. This is an important measure for realizing energy conservation and is part of the capital construction at plants and mining enterprises. It should be carefully investigated and studied and practical arrangements should be made and steps carried out according to the urgency of the matter.

With increased measurement and testing practice in plants and mining enterprises, the fundamental technical work at various measurement departments should be stepped up correspondingly. In Fujian Province, the measurement work had a late start, and a weak foundation; the great majority of local and municipal measurement offices were established within the last 1 or 2 years. Due to the lack of funds, many items of standard equipment in measurement and testing cannot be purchased and the measurement and testing work for energy conservation is difficult to develop. If the various measurement institutes cannot gradually establish their energy resource measurement standards, complete their conservation measurement and testing procedures, and greatly improve the conservation-related measurement standards and the operating condition, accuracy and stability of various types of equipment and meters, then it will be impossible to calibrate and service the conservation-related measurement and testing equipment and meters in plants and mines to keep them constantly accurate and consistent. Energy resource measurement standards should be established; electrical energy and petroleum flow standards are closely related to conservation and should be established; thermal equilibrium testing should be carried out; and calibration and service problems of energy measurement devices closely related to people's livelihood should be resolved. The measurement departments should tighten their control over expenses and put the limited funds into this urgent area. In addition, strong support from other departments is needed to resolve the problems together.

Energy resources are vitally important to the four modernizations of China and to the development of the society and the economy. The nation is now taking a series of measures to keep the conservation effort going. We therefore suggest that various levels of government and relevant departments stress and step up the leadership for measurement and testing work, help solve actual problems and let this work play its proper role and make its contribution to energy conservation.

Role of Banks

Beijing ZHONGGUO JINRONG [CHINESE FINANCE] No 1, 1981 pp 27-29

[Article by Bing Shenghai [6728 4141 3189]: "Promote Conservation and Development of Energy Resources by Properly Using Credits and Loans"]

[Text] The energy resource problem is an important issue in today's economic life and it is also closely related to the national economic readjustment and the four modernizations. To a large degree the speed of carrying out the four-modernization program is dependent upon the solution of energy resource problems. In Liaoning Province, sharp conflicts exist in energy supply and demand, and the various levels of party and government authorities are devoting great attention to the development and conservation of energy resources. At present the emphasis is on conservation, and corresponding measures are being taken to strengthen the guidance. Banks should play their professional role actively and sufficiently to provide monetary support to the nation in carrying out the plans for energy resource conservation and development and should be promoters of conservation and development.

Raise Awareness About Energy Conservation

Energy resources are the prime moving force for material production. To carry out the four modernizations we need a corresponding supply of energy resources. China is rich in energy resources and has made considerable achievements in energy development and construction since the revolution. However, due to the interference and destruction by Lin Biao and the "gang of four" for more than 10 years, the development of energy resources is seriously out of tune with demand, the management of energy is chaotic, the effective utilization rate of thermal energy is low, and the loss and waste in coal, oil, and electricity are alarming. All this has led to the present shortages in energy, seriously hampered the smooth progress of economic construction and caused inconvenience to the people's livelihood. In order to alleviate and eventually solve the difficulties in energy resources, intensified energy management, rational and conservative use of energy, and improved utilization rate along with an active increase in the investment for energy development and a forceful grasp of energy production have become urgent issues.

Energy conservation will inevitably involve improvement in technology, renewal and replacement of equipment, and reform of irrational structure in industry and products. The effectiveness of conservation will determine the growth of industrial production, the success of economic readjustment and the progress of the four-modernization construction. Comrades of the banking profession should all have a sound understanding of the energy problems and reinforce their initiativeness in supporting the conservation effort. They should have a sense of urgency and work to establish strategies for promoting long-term conservation.

Conservation Has Great Potential and Is Multifaceted

China is relatively backward in industrial technology and equipment and is not good at scientific management. Also, the cost of energy is on the low side and energy-consuming units often pay no attention to conservation and coordinated usage of energy. Accountability is ignored, energy consumption is high, thermal energy utilization is low, and losses and waste are ubiquitous. Based on rough estimates for the four municipalities of Shenyang, Anshan, Fushun and Benxi in Liaoning Province alone, the amount of combustible gas, low thermal value fuel, and production residual heat released and wasted every year is equivalent to some 6 million tons of standard coal, almost equal to the total thermal value of coal production of the nation's coal capital, Fushun Mining Bureau, in 1980. Last year, Laohutai mine at Fushun released 12 million cubic meters of mine shaft gas, which is enough to provide gas for 10,000 households for a year. The thermal efficiency of Fushun Power Plant is only 31 percent; the remainder of the heat is all carried away by the circulating water and released. If 20 percent of the released heat were recovered and utilized, it would be enough to heat 60,000 households for a year (assuming 50 square meters per residence) and the saving would be equivalent to 80,000 tons of raw coal. If the cast iron-coke ratio of Anshan Iron and Steel Mill were to reach the level of that at the Capital Steel Mill, 170,000 tons of coke would be saved every year. If the coke consumption per ton of steel were to reach the Japanese level, 2.38 million tons of standard coal would be saved in a year. The coal consumption for a ton of synthetic ammonia in Liaoning is 37 percent higher than that at more progressive provinces in the nation, and the electricity consumption is 16 percent higher, which is equivalent to additional consumption of 200,000 tons of coal per year and additional electricity consumption of 77 million kilowatt-hours. In addition, waste caused by unsystematized equipment and "big horse pulling small wagon"; waste in electricity, coal and gas; leakage, drip and evaporation due to mismanagement; and waste in the transportation and production management stages are also very serious. It is clear that the potential for conservation is very great in Liaoning Province and the ways to conserve are many. All units that consume thermal energy in casting and forging and use furnaces and kilns, especially the metallurgical, chemical engineering, construction material, petroleum, coal mining and transportation departments, have residual heat, waste gas and chemical reaction heat for reuse. Therefore, intensified management of energy resources and rational conservation are effective means for solving the shortages in energy. The guiding concepts of increasing production speed through conservation should be firmly established.

Use Credits and Loans as Leverage in Promoting Energy Conservation

Banks are in the position and have the responsibility to exploit credit and loan leverage to actively promote and support the accelerated progress of energy conservation measures. In recent years, banks at various levels and a great number of credit and loan officers have increasingly recognized the far-reaching significance of conservation and have taken an encouraging step forward in promoting conservation and developing energy resources using credit and loan leverage and have achieved preliminary results. The People's Bank of Shenyang City innovatively accumulated capital and loaned out 1 million yuan to help Petroleum Plant No 1 in carrying out modifications of its east distilling and refinery facility. The modifications were completed in 1 month and improved the thermal efficiency and thermal recovery rate by 15 percent and 25 percent, respectively. This means savings of some 20,000 tons of oil and 90,000 kilowatt-hours of electricity per year. The People's Bank of Shenyang City also provided loans to enterprises in support of new energy-saving boilers, civilian electric meters urgently needed in conservation and production improvement, and provided conservation equipment for industrial technical reforms.

In some cases the utilization and potential development of residual heat and waste gas involve a number of departments or the entire community. Here the banks can also use their broad contacts, carry out the coordination, use economic influence, promote cooperation and do a good job of systematic utilization. Bank credits and loans can play a major role in executing the national energy plans. Banks should actively use initiative in support of conservation and energy development and grasp them well as high priority efforts at this time.

1. Support technical modifications centered around conservation.

The technical modification of existing enterprises centered around conservation is a long-term policy of China's modernization construction. The various economic planning departments have now come up with a number of conservation and energy development plans, generally pointing toward engineering projects combining thermal and electric energy. From the viewpoint of long-term effects, these engineering projects make systematic use of thermal efficiency and are the proper way to make scientific use of energy resources in cities and towns. Compared with the single method of generating electricity, they have the advantage of not only increasing fuel efficiency but also of contributing to elimination of pollution and cleaning up the environment. Judging by today's needs, it is not unreasonable for the nation to support the rational development of some large-scale energy development or general energy utilization projects. However, in view of the large investments necessary for this type of construction (generally tens of millions of yuan), the complexity, high level of technology and long construction time needed for the engineering projects, and the associated problems such as resources, design, environmental protection, rational use of thermal energy and geology, the current credit and loan financial forces of the banks and the experience and technical level of the cadres are all incompatible with the work requirements. Therefore, for the time being, banks should be used mainly for the support of technical improvements centered around conservation.

For the same production volume, improvement, modification and development of potential, engineering projects generally save 50 percent of capital investment as compared with new construction projects; they also require shorter construction time and accomplish more for the same effort. Based on the principle of selective support for promising endeavors, we should give priority to those improvement and potential-development projects that require small investment, have rapid return and high economic efficiency, do not pollute the environment, and reduce the consumption of fuel. New construction projects that involve the general utilization of energy and the combination of thermal and electric energy should be left to investment by the government and planning and management by local governments. The focus for the people's banks in making loans should be energy conservation, at least for the next few years.

2. Insist on continuous decrease in energy consumption per unit of product and promote management improvement in enterprises.

This is an important avenue for boosting production, promoting readjustment and accelerating the four-modernization construction and is something every production enterprise should do. However, since energy resources constitute only a small fraction of the product cost, they often receive little attention. The banks should emphasize this point in making loans and exert their influence. This is a long-term strategy.

It has been estimated that the consumption of standard coal in China to produce 1 ton of steel, 1 kilowatt-hour of electricity and 1 ton of synthetic ammonia are respectively 1.6 tons, 453 grams and 2.7 tons. In Japan, the corresponding figures are 0.77 tons, 334 grams and 1.2 tons. In China the effective utilization rate of thermal energy is only about 30 percent, only half that of industrially developed nations. Obviously, reducing the energy consumption per unit of product is far more effective than increasing energy production in solving the inconsistency and conflict in energy supply and demand in China. One method is to use financial leverage--i.e., tight or loose credit, amount and duration of loan, and high or low interest--in promoting and supporting accelerated technical improvement and equipment updating in the existing enterprises, including the production of new high-efficiency energy-conserving equipment and material. Medium- and short-term loans should be made systematically to help the enterprises in making planned improvements and to phase out high energy-consuming equipment. This should be done on the basis of going from easy, urgent and minor reforms to more difficult, less urgent and major reforms; from single machines to serial machines; and within the available financial and material capability. We should help the enterprises to strengthen their energy resource management, rationalize their coordination, balance their production, avoid idle operation, plug leakage and reduce loss and waste. The task of conserving energy is getting more and more difficult and elaborate. Personnel in charge of credits and loans should go right to the enterprises and shops to investigate and understand the situation thoroughly so that they can effectively help the enterprises improve energy resource management.

3. Insist on unified planning and overall balance in conjunction with promoting readjustment.

Energy conservation and development are among the central issues of the economic readjustment. All regions and departments should plan well to achieve a general balance in equipment, capital, resources, production and construction force under the guidance of the national plan. Banks should get involved in the regional economic readjustment, open up their credit and loan activity, and provide selective support on the basis of economy, rationality, necessity and practicality. Large and medium-scale projects should be given overall planning and should be evaluated by special design and technical departments, then approved by planning departments. In making minor reforms and modifications, consideration should also be given to overall balance, long-term effect, potential in resource and recovery, and the development prospects of related enterprises to prevent waste of capital and material. The tendency to blindly rush into a program should be overcome.

4. Insist on credit and loan principles and economic effectiveness.

Economic effects should be stressed in making loans, and the pulses and minuses of capital investment and economic return in making conservation loans should be weighed carefully to insure better return and timely payback of the principal and interest. There are times when the investment for a certain reform, improvement or potential-development program is substantial but the monetary return to the enterprise is not evident. For example, the technical modification of the chlorine gas delivery pipeline at the Shenyang Chemical Plant required an investment of 2.6 million yuan; after the modification, the annual saving of electricity would be 3.38 million kilowatt-hours for a value of only 194,000 yuan, and it would take 15 years to recover the investment. Using loan money at the current interest rate for medium- and short-term loans, 130,000 yuan of interest would have to be paid every year, while the enterprise could only recover a few hundred thousand yuan of the investment in a year. For this reason, some enterprises are not interested in getting loans to fund energy conservation programs. Some people say that energy conservation projects require a lot of effort and investment but the saving and return are small, and so they are uneconomical.

In view of the situation just described, the emphasis in bank loans should be for projects with greater return. Programs utilizing combustible gas and residual heat for public service should be carried out through government investment. The loan amount should be determined through a general assessment of the reform and improvement fund and the equipment overhaul fund; the shortage amount should then made up by a loan within the ability to pay back. In principle, the source for paying back the loan should be using the entire saving and profit of increased production to pay back the loan in its entirety after production begins. After the loan is paid back, profits should go into contract payment. If some enterprises would rather use the excess overhaul fund and modification fund in expanding their reproduction operation and use a certain percentage of the profit to pay back the loan, this should also be acceptable to the bank.

Since energy loans are a new practice in the beginning stage, continuously consolidated experience will be needed to gradually perfect the practice. Bank personnel in charge of loans should carefully and extensively study the engineering projects and exploit the financial leverage innovatively within the realm of the current credit and loan system. To provide adequate power for the development of four-modernization construction and for economic readjustment, we should act according to the principles of economics, rationally determine the direction of investment, and actively support the conservation and development of energy resources.

Beijing Conservation Efforts

Beijing BEIJING RIBAO in Chinese 21 May 81 p 2

[Article by Hong Chuanzhen [3163 0278 2182]: "Municipal Government Holds Commendation Ceremony and Recognizes Conservation Achievers"]

[Text] The Beijing Municipal People's Government has held a citywide conservation commendation ceremony and recognized the outstanding achievements and contribution to conservation work in 1980 made by 42 progressive enterprises for conserving energy, 6 progressive units for conserving water, 10 progressive groups for conserving water, 474 progressive boiler rooms, 57 progressive motor teams, 236 progressive boiler operators and 119 progressive automobile drivers.

Among those addressing the meeting were Deputy Mayor Zhang Peng [1728 1756], representatives of conservation progressive enterprises, the municipal transportation company yard No 7, and the chemical plant, and representatives of progressive drivers and boiler operators.

In 1980, Beijing overfulfilled the conservation quota for coal, electricity, oil, and other fuels. As compared to 1979, the gross value of industrial production in the city increased by 9.7 percent, and the coal and electricity consumption per 10,000 yuan value of production decreased by 5.4 percent and 4.8 percent respectively. Increase in production and income through conservation was realized in 1980.

In his address to the meeting, Zhang Peng pointed out that the potential for conservation in Beijing is still great. Our industrial structure is basically oriented toward heavy industry and is energy intensive. The products, equipment, skill and technology of the enterprises are backward and the management work is incompatible. According to test results and statistics, the utilization rate of thermal energy is about 29 percent, and waste of energy resources is still prevalent. Leaders at various levels should further improve the understanding of the importance of energy work and step up the leadership. In supplying the energy resources, in addition to insuring an adequate supply for the political activities in the capital and the people's livelihood, a policy of selective support must be maintained in supplying resources for industrial production. Priority should be given to the needs of the light and textile industries, especially to products with good quality and market ability and economic in energy consumption. Energy needs for the production of well-known brand products and the 80 items for which increased production was recently affirmed at the municipal industry and transportation work conference should be insured. For energy-wasteful production, the supply of resources should be restricted or a deadline should be set for improvement. The three energy conservation directives of the State Council must be thoroughly carried out. The nation and the city have already decided to cut down on oil-burning units and facilities and to switch to burning coal. Electricity should be allocated in fixed amounts according to the permit; anyone who exceeds the allowed quota will be restricted in usage and the amount exceeding the allowance will be deducted and returned, but the amount saved belongs to the user. Consumers of electrical energy during the "valley" period will receive special treatment; those who use electricity at the "peak" period and exceed the allowed amount and those enterprises whose electrical consumption in 1982 fails to meet the national standard will receive a price increase. The consumption of automobile fuel and processed oils must be controlled and decreased. The recovery of lubrication oil should be insisted upon, and regarding the supply of coal, a price increase whould be imposed on those users who exceed the allowed consumption.

Shanghai Metallurgical Bureau Conservation

Shanghai JIEFANG RIBAO in Chinese 23 Mar 81 p 1

[Article: "Encouraging Results Achieved by City's Metallurgical Bureau; By Strengthening Management, Lowering Unit Consumption, Remodeling Facilities, and Renovating Technologies, Energy Equivalent to More Than 265,000 Tons of Standard Coal Saved Last Year; Nearly 83 Percent of All Steel Rolling Heating Furnaces Achieved Oil Consumption of the Level of "First-Class Furnace" as Designated by the Ministry"]

[Text] The vast majority of the staffs and workers of the Shanghai Metallurgical Bureau have strived for increased production and development while conserving energy. Last year the entire bureau was able to conserve various types of energy resources equivalent to 265,000 tons of standard coal, including more than 58,800 tons of fuel oil. During the months of January and February this year, compared with the same period last year, the entire bureau further conserved energy resources equivalent to more than 20,000 tons of standard coal, including more than 3,600 tons of fuel oil, and contributed significantly to easing the contradiction in the city's energy supply and demand and assuring the growth of the light and textile industries.

The metallurgical industry is a major energy-consuming enterprise, consuming more than four times the energy per unit of production consumed by the light and textile industries. Since the products of the metallurgical industry are basically things which are indispensable to the national economy, it is impractical to cut down on production in order to save energy so as to help develop the light and textile industries. Under such circumstances personnel in this industry have tried all means and methods to conserve energy. Since last year, they have implemented overall norm management on all energy resources, including oil, coal, coke, electricity, water, wind and steam, methane, oxygen, and compressed air. They have implemented management of the entire process of energy conservation of all departments, including all aspects such as planning, supply, facilities, and operation. From the plant headquarters to the factories and shops, energy management organizations have been established and everybody has been involved in the energy conservation management. Various measuring instruments have been installed and overall accounting of various forms of energy resource has been implemented. Energy conservation is practiced in all fields, including transportation, production and consumption. Significant results have been achieved through the strengthening of these management measures. Moreover, since the overall process of energy conservation management was implemented under the premise of guaranteeing the quality and quantity of products, the No 3 Steel Plant has operated its blast furnace only as much as necessary and has shut down the furnace as much as possible in order to conserve energy. The No 3 Rolling Mill used to operate three furnaces all the time. Since last year, this mill has strengthened planning and coordination and has steadfastly operated only two furnaces at a time. As a result, production there increased 13.5 percent over the previous year together with a 17.1-percent reduction in the oil consumption per ton of steel produced.

Remodeling facilities and renovating technologies have also had a significant impact on energy conservation. Altogether there are 29 oil-burning steel rolling heating furnaces belonging to this bureau. These furnaces used to consume 65 percent of the oil consumed by the entire bureau. Starting in 1979 a series of consolidated energy conservation technical measures was implemented, including modification and improvement of the furnace type, reduction of heat loss through the furnace wall, renovation of water pipes beneath the furnace floor, and increasing the volume and temperature of the hot air. As a result, per ton of steel, oil consumption decreased from an annual average of 61.69 kg to 52.94 kg last year, amounting to a drop of 14.2 percent. By this single item alone, more than 40,600 tons of oil were conserved last year. Today, the oil consumption standard of 24 out of the 29 oil-burning furnaces has already reached or surpassed the standard of "first-class furnace" as designated by the Ministry of Metallurgy, and no furnaces are classified as either "third-class furnace" or "outside class furnace" any more.

In addition, the bureau has further implemented norm undertaking and the principle of selecting the best to make arrangements on matters related to use of oil by the various enterprises in order to promote each plant carrying out its own energy conservation work. Each plant has tried all means and methods in order to bring down the unit consumption and to guarantee the economic effect and has achieved quite significant results in the conservation of energy.

Wenjiang Nitrogen Fertilizer Plant Accomplishments

Chengdu SICHUAN RIBAO in Chinese 17 Mar 81 p 2

[Article by Zhang Shangqing [1728 1424 3237]: "Wenjiang Nitrogen Fertilizer Plant Overcomes Insufficient Natural Gas Supplies"]

[Text] Faced with sharp cutbacks in natural gas supplies in 1981, the Wenjiang Nitrogen Fertilizer Plant did not fight for energy resources with the administration but instead strived to increase production and profit by developing internal potential and conservation. The January-February synthetic ammonia and ammonium carbonate production target was completed 10 days ahead of schedule, and the average gas and electricity consumption per ton of ammonia and the total energy consumption per ton of ammonia were both lower than last year's level, putting the plant among the top rank of similar plants in Sichuan Province. The Wenjiang Nitrogen Fertilizer Plant is a red flag unit on the national small chemical fertilizer front and is a progressive enterprise in Sichuan Province and the local area. Last year this plant produced some 20,000 tons of synthetic ammonia, reduced its energy consumption and product cost, and overfulfilled the contract payment quota. In 1981 the volume of natural gas allocated by the administration has been cut back sharply and the supply is far below the level demanded by production needs. In the face of this situation, some comrades were deeply concerned and wanted to ask the administration for a larger allocation. However, after analyzing the situation, the plant leadership decided that they should not fight for energy resources which are in short supply but instead they should develop internal potential. They decided that they should not just have their own enterprise in mind but should also think about other plants. They explained this clearly to the staff and workers at a meeting of the staff and worker representatives and encouraged them to increase production, support the agriculture and contribute to the national cause even though the natural gas supplies were cut back sharply.

On the basis of this common understanding, the plant made production adjustments centered on improvement in the effective utilization rate of the energy resources and shut down one system and let a single system run at full power to carry out production. It also made efforts in the area of conservation and loss reduction, strengthened the management of energy resources and equipment, and improved the effective utilization of resources and the economic effect per unit of energy.

It distributed the energy resources to the main shift like rationing food, and demanded a certain volume of qualified products in return for the consumption of a certain amount of resource in order to achieve the maximum economic results. In the meantime, it worked out technical measures for conservation, recovered the gas released from the synthetic tower and increased the daily production of synthetic ammonia by 2.5 tons. The small amount of ammonia contained in the water of the carbonization recovery wash tower, which used to be discharged into a ditch, is now returned to the recovery tower and reused. In order to increase the economic efficiency of the energy resources, the plant also compared the economic return of producing ammonium carbonate and aqueous ammonia and adopted a plan to produce more ammonium carbonate and less aqueous ammonia. By using this scheme, it increased the ammonium carbonate production per cubic meter of natural gas from the level of 2.93 tons last year to 3.3 tons. The economic return per million kilocalories of thermal energy showed a net gain of 7.44 yuan, representing a 20.72-percent growth, and the consumption of gas and electricity have also been reduced greatly. For the first 50 days of 1981, the saving in gas and electricity amounted to 59,000 yuan in comparison with the requirement of the national plan.

Hubei Hydropower Workers Conservation

Wuhan HUBEI RIBAO in Chinese 10 May 81 p 1

[Article by Lan Guozhang [5695 2654 7022]: "Province's Hydropower Workers Go All Out To Conserve Energy"]

[Text] Employees and workers of Hubei's electric power department--the biggest consumer of coal--have adopted a scheme of periodic analysis of the economic activity and selected the most efficient and economic measures in the drive to conserve coal. In the first 4 months of 1981, Hubei province overfulfilled the electricity generation quota by 240 million kilowatt-hours, while at the same time the coal consumption registered a savings of 6,700 tons and the power department's own electrical consumption was reduced by 34 million kilowatt-hours.

Hubei is short on coal resources, but its hydroelectric machine capacity is rather large. Hubei should generate as much hydroelectric power as possible, while the thermoelectric power generation should be properly controlled so that thermoelectric power is principally used in balancing and adjusting the supply of large electrical power networks. This is an important policy first adopted by Hubei. In 1980 and 1981, Hubei had abundant rainfall. The hydropower stations used the water sensibly and generated an extra 1 billion kilowatt-hours of electricity. Just this one item saved Hubei 500,000 tons of standard coal.

When thermoelectric power generation is used mainly for adjusting the imbalance between peak and valley power usage, the generator will start and stop frequently and the coal consumption will certainly increase. Since the hydroelectric power is transmitted over long distances, the line loss increases accordingly. In order to conserve electricity used by the power industry itself and to cut down the line losses, the power plants set up a new award system for energy conservation. The operating crew at Songmuping power plant constantly carried out economic analyses, looked for causes and made timely adjustments to the operation. They consistently kept the facility in optimum condition and improved the thermal efficiency by 1 percent. Shashi thermoelectric power plant converted its water softening system into chemical salt-removing system and saved 5 tons of crude oil per day. Qingshan power plant also installed a comprehensive display system for continuous monitoring and control of the consumption and this had a significant effect on reducing the coal consumption. Before September 1980, the generation of 1 kilowatt-hour of electricity required 447 grams of coal, while now it is 443 grams. Just this one item alone saved 2,900 tons of standard coal for the province in 6 months.

SHANXI PLANT ADAPTS TO CUSTOMERS' ENERGY NEEDS

Taiyuan SHANXI RIBAO in Chinese 4 Apr 81 p 2

[Article by Li Hai [2621 3189]: "Building an Energy Resource Base During the Readjustment; Shanxi Machinery Plant Manufacture More Winches and Coal-Loading Machines to Meet the Needs of its Customers"]

[Text] The Shanxi Machinery Plant has aggressively grasped ideological education during the readjustment and has guided its staffs and workers to pay close attention to the product market, to strive to improve product quality, to honor the contract, to establish a good reputation, and to guarantee services and thus has contributed anew to construction of the coal energy resource base.

At present, the Shanxi Machinery Plant serves its customers with the motto "fast, excellent, cheap and new," and is aggressively attracting customers and expanding its product market. By fast, it is meant to shorten the production cycle as much as possible and to deliver goods on time by honoring the contract. By excellent, it is meant to manufacture a high-quality product, to create a name-brand product which the customers can trust, and thus establish a sales base. By cheap, it is meant to reduce the production cost while increasing production in order to achieve a rational product price. By new, it is meant to understand the needs of market, to adapt itself to the circumstances, and to manufacture new products in a timely way so as to meet the needs of the customers. A few years ago, this plant stuck to a few "continuous system" products and did not want to change. As a result, imbalance between production and sales was created, with a stockpile of unsold goods. Starting this year, in addition to the traditionally "hot line products," the plant has designed and trial manufactured a kind of high-efficiency, low-cost coal-loading machine after careful research and thorough understanding of the urgent needs of the small mine operators. As soon as the model machine was built, orders rushed in from everywhere, including mines in the southeast and middle sections of Shanxi Province. One of the units from Gujiao area even placed an order with prepayment. This plant understands very well the customers' circumstances. Sales and technical personnel are dispatched regularly right to the sales bases, the mines, and to the production front beneath the well in order to understand what is needed on the production front and what facilities are favorable to the mining industry, so that timely readjustment may be made on its production line. For example, plant personnel learned that a 30-kW electric motor was too big for the 800 windlass in an area where there was a shortage of electricity, they immediately started to manufacture 22-kW electric motors, and their engineers started to design smaller windlasses of 5-ton capacity. By doing so, they not only held onto an old sales base but also developed some new customers, and their path is growing ever wider. During the course of thoroughly implementing the readjustment plans, this plant also paid sufficient attention to educating its staff and workers in the concept of "quality first." They also organized customer service groups and called discussion meetings using informal come-as-you-are format and asked the customers' opinions, which were then passed on to the associate plants where technical tactics for launching an assault on the problem were formulated. In accordance with the needs of the customers, this plant has recently manufactured a new line of 11.4-kW winches. The customers are generally satisfied with the quality, performance, and the high production efficiency--a production of 7 tons of coal a minute. Each item of this product is snatched up by the customers before it is warehoused. So far, contracts to seel more than 200 units of this winch have been signed.

In order to maintain steady growth in sales of its products, this plant has reassigned a dozen or so strongly business-minded and intensely motivated comrades to the sales staff in order to strengthen its ranks and so they can be dispatched to various places to promote sales of its products. So far, they have sold more than 120 units of the 800 windlasses, 25-kW winches, and coal-loading machines. Furthermore, based on teh concept of total responsibility to the customers, they undertake the maintenance of their own products, are responsible for supplying the repair parts and make house-calls to service their products. They also organize operator training courses to help familiarize their customers with their products and to become more proficient in operational skills, and have thus won the acclaim of many customers.

COAL UTILIZATION DISCUSSED; SHANXI PRODUCTION VIEWED

Problem of Effective Utilization

Beijing MEITAN KEXUE JISHU [COAL SCIENCE AND TECHNOLOGY] in Chinese No 5, May 1981 pp 2-7

[Article by Wang Yinren [3076 1377 0086]: "Exploration of the Problems Concerning Rational and Effective Utilization of Coal Resources"]

[Text] The energy problem is an important strategic world problem. Rational development and effective utilization of various energy resources are the indispensable material foundations to realize modernization of the national economy. Coal, petroleum, and natural gas are common mineral energy resources; they are not only the main fuels and power for building up modern production, but they are also important industrial materials. At the beginning of the 1970's there was a crisis in petroleum, and since then many nations have placed their hopes on coal. Therefore, greatly developing and rationally utilizing coal resources have become an important part of the energy policies of many nations.

Our nation's reserve and production of coal resources rank third in the world. But compared to the world's industrially developed nations, our nation's efficiency of utilization of thermal energy is generally lower than the advanced levels of foreign nations because our nation's population is large and growing rapidly, industrial and agricultural development is rapid, while the business management of coal production is not perfect enough, and all this affects rational utilization. Now, these shortcomings have already visibly affected the national economic development and improvement of the needs of the people's livelihood. Therefore, various forceful measures must be taken to improve the structure and quality of products, and to strengthen the scientific management system for a rational and effective utilization of coal products in order to hasten the improvement of the techniques and efficiency of processing and utilization of coal, to study and develop new techniques and new technology for comprehensive utilization of coal chemistry to develop the economic value of coal to the greatest extent.

The development and construction of energy resources must be farsighted, because the construction cycle for developing energy resources is generally about 10 years. The energy resources needed 10 years from now must be studied, planned and arranged starting now. Scientific research in the rational development and utilization of energy resources must take the lead in building up production according to the patterns of scientific development. For such efforts to become applicable requires advanced technology, and developing the productive forces to promote the economy requires a relatively long period.

I. Production and Utilization of Domestic Energy Resources and Coal

Although our nation's coal resources are rich and all varieties are present, mining regions need to be more profoundly surveyed and explored, geological information must be supplemented in order to understand the hydrological condition and the changes in the quality of coal and to solve complex problems in shipping by sea and by land, transportation and power transmission. Therefore, it is still difficult to develop and utilize this part of the resources.

During the 5 years from 1975 to 1979, our nation's total energy consumption was 2.614 billion tons of standard fuel, and the average annual consumption was 523 million tons, a gradual increase from 453 millions tons in 1975 to 586 million tons in 1979 (see Table)

Domestic Energy Consumption, 1975-1979.

问题探讨

煤炭资源合理与有效利用问题的探讨

汪 寅 人

能源问题是一个世界性的重大战略问题。合理开发和有效利用各种能源，是实现国民经济现代化必不可少的物质基础。煤炭、石油、天然气等常规矿物能源，不仅是近代生产建设中的主要燃料和动力，而且也是重要工业原料。七十年代初期，石油发生危机以来，不少国家把希望寄托到煤炭上。因此，大力开发和合理利用煤炭资源，已成为许多国家能源政策的重要组成部分。

我国煤炭资源的储量与产量，目前都居世界第三位。但与世界工业发达国家相比，因我国人口多而增长快，工农业发展迅速，而煤炭的生产经营管理不够完善，影响合理使用，热能利用效率普遍低于国外先进水平，现已到了显著影响国民经济发展和改善人民生活需求的程度。因此，必须采取各种有力措施，改进产品的结构和质量，加强合理和有效利用煤炭产品的科学管理制度，尽快提高煤炭的加工利用技术和效率，研究和发展煤炭化学综合利用新工艺和新技术，达到最大限度地发挥煤炭的经济效益。

对于能源的开发建设，必须从长远着眼。因开发能源的建设周期，一般是10年左右。10年以后需要的能源，从现在起就应着手研究、规划和安排。而合理开发和利用能源的科研工作，必须按科学发展规律走在生产建设之前，而变成能应用的先进技术和发展经济的生产力，就需要更长的周期。

一、国内能源与煤炭的生产和使用情况

我国煤炭资源虽然丰富，品种也比较齐全，但在各地区的分布并不平衡。某些矿区还需加深勘探程度，补充地质资料，搞清水文和煤质变化情况，以及解决水陆交通、运输、送电等复杂问题。所以，目前开发和利用这部分资源仍较困难。

1975～1979年五年中，我国能源总消费量为26.14亿吨标准燃料，平均年消费量为5.23亿吨。从1975年的4.53亿吨逐年增长至1979年5.86亿吨（见表）。

1975～1979年国内能源消费构成表

1 年度	2 能源总消费量（亿吨标准燃料）	③ 能源消费构成（%）			
		④ 煤炭	⑤ 石油	⑥ 天然气	⑦ 水电
1975	4.53	72.2	20.7	2.5	4.6
1976	4.76	70.3	22.6	2.8	4.3
1977	5.21	70.6	22.2	3.1	4.1
1978	5.78	69.9	23.5	3.2	3.4
1979	5.86	71.3	21.8	3.3	3.6

我国能源总消费量已达到世界第三位。但按我国9.7亿人口计，每人平均能源年消费量仅为600公斤标准燃料（其中平均每人年消费标准煤约420～430公斤），与美、苏等工业发达国家按人口平均计算的能源年消费量，相差十分悬殊。

建国30年来，我国煤炭产量增长了近20倍，而工农业总产值增长了14倍。到1979年煤炭产量增长速度已放慢。30年来，其它主要工业，如钢、铁、化肥、电力等工业生产增长速度与幅度均高于煤炭工业。钢产量增长约218倍，生铁产量增长约147倍，电力增长约65.6倍（包括部分烧油电站），化肥增长约1690倍（包括用石油与天然气作原料的部分

[Key on following page]

Key:

1. Year
2. Total energy consumption (100 million tons standard fuel)
3. Composition of energy consumption (%)
4. Coal
5. Petroleum
6. Natural gas
7. Hydroelectric power

The total energy consumption in our nation already ranks third in the world. But taking into account our nation's population of 970 million people, the per capita average energy consumption per year is only 600 jin of standard fuel (average per capita annual consumption of standard coal is 420-430 jin), and compared to the per capita average annual energy consumption of industrially developed nations such as the United States and the Soviet Union, the difference is very great.

Over the past 30 years since the founding of the nation, our nation's coal production has increased nearly 20 times, while the total production value of industry and agriculture has increased 14 times. In 1979, the rate of increase in the production of coal began to slow down. For 30 years, both the rate and scale of growth of other major industries, such as steel, iron, chemical fertilizers, electric power, were larger than that of the coal industry. Steel production grew about 218 times, pig iron production increased about 147 times, electric power increased about 65.6 times (including some fuel burning power stations), and chemical fertilizers increased about 1,690 times (including the part of the nitrogenous fertilizer industry that uses petroleum and natural gas as raw materials).

Our nation's efficiency of utilization of coal is relatively low, and the potential for conserving coal is very great. For example, the ratio of consumption of coke for smelting iron during 1975-1977 was 620-640 kilograms of coke for smelting each ton of iron (equivalent to the level at the beginning of the 1960's abroad), and in 1978-1979, the ratio of consumption of coke per ton of iron dropped to 550-560 kilograms, a conservation of 60-80 kilograms of coke per ton of iron (equivalent to 80-100 kilograms of washed coal). But compared to the level of the 1970's of industrially developed nations (the ratio dropped to below 500 kilograms), there is still a lot of potential which can be exploited, and the ratio of consumption of coke per ton of iron can be lowered further, by 50-60 kilograms. The ratio of consumption of coke for smelting iron in medium and small blast furnaces operated by localities in general is even higher, averaging 700-800 kilograms. Again, for example, the difference between the average consumption of coal at our nation's coal fueled power plants and the advanced levels abroad is still very large (about equivalent to the level of the 1960's). It dropped from 450 grams of standard coal per kilowatt in 1975 to 422 grams in 1979. Foreign advanced levels have already reached 300-350 grams of standard coal per kilowatt. Again, for example, the unit consumption of raw coal for the manufacture of synthetic ammonia using coke or anthracite in recent years has dropped from over 1,500 kilograms to 1,360 kilograms, higher than foreign nations by over 300 kilograms. Viewing the indicators of coal consumption by the three major industries described above, we can see that if rational and effective measures are taken, a large amount of coal can be conserved.

II. Development and Utilization of Energy Resources Abroad

The total consumption of energy abroad, according to incomplete statistics, increased from 2.45 billion tons of standard fuel in 1950 to 8.55 billion tons in 1978 (it is estimated that by 1980 this already reached 10 billion tons), an average annual increase of over 200 million tons of standard fuel. The consumption of coal dropped from 61 percent to 27.5 percent, and the consumption of crude oil and natural gas increased from 37.5 percent to 69.5 percent. Within the last 30 years, the amount of energy consumption increased on a large scale. In Japan, it increased about 9.6 times, in the Soviet Union, about 5 times, in West Germany nearly 3 times, in the United States about 2.2 times (in 1978 the consumption of standard fuel already reached 2.5 billion tons). According to 1979 statistics, the national per capita average annual consumption of energy in the United States was 11.32 tons of standard fuel. In the Soviet Union, West Germany, Britain, France, it was 4 to 6 tons of standard fuel, and in Japan it was 3.78 tons. The average per capita production of coal in the United States, the Soviet Union, Britain, West Germany is 3.5 to 2.0 tons in the Soviet Union, 1.9 tons in the United States, and 1.4 tons in Great Britain. The average per capita production of natural gas is as high as 2,430 cubic meters in the United States, 1,540 cubic meters in the Soviet Union. The per capita generation of electric power is over 10,000 kilowatt-hours in the United States, nearly 6,000 kilowatt-hours in West Germany, and 5,450 kilowatt-hours in Britain. The per capita average production of steel is 965 kilograms in Japan, 750 kilograms in West Germany, and 560 kilograms in the United States and the Soviet Union. The per capita national product in 1979 was $10,320 in West Germany, $9,550 in the United States, $8,830 in France, $8,680 in Japan, $5,580 in Britain, and $4,750 in the Soviet Union. The amount of coal consumption in the United States, the Soviet Union, West Germany constitutes 86.8 percent, 97.8 percent and 94.8 percent of the nation's yield, respectively (West Germany counts only hard coal and does not include brown coal). In the United States, Great Britain and France, 78 percent, 69 percent and 55 percent of the domestic coal is used for power generation, and in West Germany and the Soviet Union, 47.7 percent and 40.0 percent is used for power generation. In Japan, it is only 11.3 percent. The percentage of coal used by the coking industry is 76.7 percent in Japan, 41.4 percent in West Germany, 31.9 percent in France, 30 percent in the Soviet Union, 11 percent in the United States and over 13 percent in Great Britain. The percentage of civilian coal is the highest in the Soviet Union, constituting 16 percent of consumption; in Great Britain, 10 percent; in France, 6.6 percent; and in the United States and West Germany, only 1-2 percent.

III. The Major Problems Existing in the Development and Utilization of Coal Resources in Our Nation

Internationally, the "energy elastic coefficient" (i.e., the ratio between the annual rate of increase in energy consumption and the annual rate of increase in the total production value of industry and agriculture) is frequency used to study the relationship between energy consumption and the growth of the national economy of each nation. Under ordinary conditions, this coefficient should be about 1.0, i.e., the rate of growth of energy consumption and economic construction should be basically the same. According to statistical information on some major industrially developed nations, during the beginning period of industrialization, the fuel industry developed relatively quickly to stimulate the rapid development of other industries. Limited by the level of science and technology of the time, the rate of increase in energy consumption has always been faster than the rate of increase in the total value of national production. The ratio between the two has frequently been greater than 1.0. From the beginning of the 1950's to the latter part of the mid-1970's, because of the rapid increase in the level of science and technology and the changes in the composition of energy and the national economic structure, the growth rate of energy consumption generally dropped. In industrially developed nations, the "energy elastic coefficient" has already dropped to 0.7-0.8, while that of developing nations is usually larger than 1.0 (it is 1.22-1.27 in our nation). When implementing our nation's energy policy mainly based on coal, studying the "elastic coefficient" of energy consumption must be considered on the basis of coal as the main factor. To assure the continued growth of our nation's national economy and to enable the "elastic coefficient" of energy consumption to drop from 1.22-1.27 to ≤ 1.0 are important questions that are worth overall study. What effective measures can be taken to solve this important problem? The first is to intensify the development and increased production of energy (mainly coal). The second is to change the structure of the national economy, adjust the ratio of ihe industries that consume a lot of energy and those that consume less energy (the ratio of heavy industry and light industry). The third is to greatly conserve energy, implement various effective technological reform measures, and increase the efficiency of utilization of thermal energy so that coal can be rationally and effectively utilized. Solving the shortage of supply and demand for energy must place conservation of energy (especially conservation of coal) in a position of priority within the near future. Considering the long range development, we must rationally develop and effectively utilize our nation's energy resources according to the "principles of equal emphasis on increasing production and conservation." It should also be pointed out that at present it is possible to conserve relatively large amounts of energy. But as the efficiency of utilization of energy increases, the rate of conservation will drop. Therefore, gradually developing the study and developing various kinds of new energy according to plan are also very important.

There is a lot of potential in the conservation of energy in our nation. This means that a lot of waste still exists in the use of energy. According to surveys and analysis of concerned aspects, about 35 percent of the waste is mainly due to the lack of a sound scientific management system within the enterprises. The remaining 65 percent of the waste is due to outdated and backward production techniques and technological facilities, irrational economic structure and inadequate planning. The main problems related to coal in energy consumption are the following:

1. Irrational structure of coal products, few varieties, and poor quality, affecting the efficiency of use

Among the world's major coal producing nations, our nation still produces, operates and manages raw coal. Because the coal producing departments "only care about production and do not care about use" and fail to conduct in-depth surveys and studies of the true needs of the users, therefore, the varieties of coal produced are few, the quality is poor, and "they care only about completing the production task and not about the quality." Although in the bureaus and mines with a relatively large coal system there are a definite number and scale of separation plants and dressing and washing plants, and there are regulations concerning the ash content and the size and granularity for certain types of coal, these processed product types are few, frequently they are not fixed varieties, and they can hardly satisfy the demands for quality and variety of products by the various different industries.

2. Irrational production and utilization of types of coal

Of the raw coal produced in our nation, coal for coking constitutes over half of the production of coal of the entire nation. But the proportion of washing in recent years has constituted only 28 percent of the coking coal. The remaining 70 percent and more is used as ordinary fuel. This is a poor use of superior quality resources and a great waste. For example, the fat coal of Fangezhuang Mine of Kailuan and the coking coal of Shitai Mine in Huaibei are superior quality coking coal, but regrettably they can only be used for electric power generation and ordinary fuel because no washing plant has been built. If such irrational production and utilization are not corrected in time, a seriously unfavorable situation will result that will affect the necessary supply of superior quality coking coal for some large-scale joint steel and iron producing enterprises. Another phenomenon of wasting coking coal is that a relatively large quantity of metallurgical coke "is being used unsuitably and high-quality products are used for menial purposes."

One of the prerequisites of rational utilization of coal is "the consistency of supply and demand, the marketed products must be suited to the needs of the market." Otherwise, "the supply will not satisfy demand and products will not be suited for marketing." The coal will not be effectively utilized and this will cause wastefulness and loss. If raw coal is supplied to power plants with boilers burning pulverized coal, because of the relatively large quantity of lumps of coal and waste rock, sometimes this will cause the coal grinder of the power plant to fail to supply sufficient pulverized coal, thus affecting the efficiency of the boiler and reducing the capability of power generation. The coal fired boilers of ordinary power plants are all designed according to the characteristics of the quality of the coal, and the appropriate type of coal of corresponding quality must be supplied to assure a relatively high combustion efficiency of the boiler and output by the power station so that the coal is rationally and effectively utilized. For example, nitrogenous fertilizer plants generally require the use of lump anthracite as the raw material for manufacturing synthetic gas. But the percentage of lumps in the coal produced by our nation's major anthracite mines is relatively low, constituting only 15 percent of the total yield of anthracite throughout the nation. The percentage of lumpy anthracite produced by the Shanxi Jingcheng Bureau of Mines reaches over 55 percent, and there is still a potential to be exploited for increasing the production of lumpy anthracite (including the building of more separation plants, and the separate production of lump coal and pulverized coal). At present, anthracite is not fully screened and classified and rationally distributed, and many small chemical fertilizer plants make pulverized anthracite into lumps, increasing the cost of producing gas and wasting coal. This is a conflict of the irrational use of coal. In designing enterprises that consume a lot of coal, frequently, too little consideration has been given to the study of the adaptability and the economy of the needed coal source (including the varieties of coal, demands for characteristics and quality). Thus, production cannot be carried out normally, causing serious wastefulness, loss and environmental pollution. The main reason is that the designers do not have an overall understanding and grasp of the technical and technological demands of rational utilization of coal and the basic nature of the coal producing regions of our nation.

3. Low efficiency of utilization of coal, high consumption, poor economic results of technology

Reportedly, the average rate of efficiency in the utilization of energy domestically is about 28 percent. The average efficiency in the utilization of the thermal energy of coal is about 20 percent. According to analysis, the consumption of energy of major enterprises using coal varies greatly. In 1979, the nation's most advanced small nitrogenous fertilizer plant consumed 1,845 kilograms of standard coal per ton of ammonia, while the average consumption of coal at the nation's small chemical fertilizer plants was as high as 3,730 kilograms of standard coal. The thermal efficiency of our nation's thermal power station averages 27-28 percent, while the advanced level of foreign nations reaches 35-38 percent. The highest thermal efficiency can reach 40-41 percent. If various effective techniques and management measures are taken, it is possible to lower the consumption of coal by the different systems of industries.

In our nation, there are also many regions that produce massive amounts of "indigenous coke" (estimated total production reaches 10 million tons). Compared to organic coal, the coke forming percentage is low, 15-20 percent, valuable chemical byproducts cannot be retrieved, and serious environmental pollution is caused. This is a big waste of coking coal resources. The annual consumption of civilian coal in our nation has already reached 150 million tons, and the efficiency of utilization of thermal energy is only 15-18 percent. The efficiency of ordinary coal fired industrial boilers is also relatively low, averaging about 55 percent. The result of direct burning of coal is a massive waste of thermal energy and pollution of the environment. If the techniques and technology of burning coal can be reformed, if the efficiency of utilization of thermal energy can be increased, a large amount of coal can be conserved. If the thermal efficiency of every 100 million tons of civilian coal can be increased by 3-5 percent on the present foundation of efficiency in the utilization of thermal energy, this would be equal to a conservation of 20-36 million tons of coal.

4. Coal for daily use is deficient, affecting improvement of livelihood and production; coal for production is inappropriate, affecting the increase in production value and efficiency

The ratio of the use of energy for living and for production in our nation is 1:4.5, while it is 1:2.3 in Japan, and 1:1.2 in the United States. In 1978, the percentage of fuel for civilian use was 17.8 percent, mainly coal used for living (not counting the supply of coal for local kilns and coal for self-consumption by plants). The average annual per capita consumption of coal was 211.5 kilograms.

The average annual per capita consumption of coal used for living by city residents was 730 kilograms. The average annual per capita consumption of coal used for living by farm village residents was only somewhat over 110 kilograms. The farm villages burn 500-600 million tons of stalks and grasses each year (equivalent to 250-300 million tons of standard coal). The availability of coal gas in our nation's cities is very low; there are only a little more than 12 million people throughout the nation who use gas, constituting only 1.3 percent of the nation's population (in Japan, it is over 76 percent), and about 7 percent of the urban population. Of the nation's more than 190 medium and larger cities, only one-third of the cities has partial availability of gas. Most of the city residents still use coal as direct fuel, seriously polluting the urban environment. According to foreign reports, the lowest average consumption of energy needed for living by the modern urban dweller is about 1.6 tons of standard coal per person per year--far from that of our nation.

In 1978, the energy consumption of our nation's industries was equivalent to about 400 million tons of standard coal. The major users were metallurgy and the chemical industry. The total energy consumption of the metallurgical industry was equivalent to 85 million tons of standard fuel, constituting 16 percent of the total consumption of the nation's energy (it consumed 11.7 percent of the nation's coal, 14.9 percent of the heavy oil, 24.1 percent of the power, 9.5 percent of the natural gas). The total energy consumption of the chemical industry was about 68 million tons of standard fuel, constituting 12 percent of the total national consumption of energy. Half was used for the production of chemical fertilizers, and synthetic ammonia alone consumed 29,350,000 tons of standard coal and 1,850,000 tons of heavy oil (not including natural gas and power). These two industries consumed 30 million tons of energy more than the nation's energy for civilian use and agriculture combined.

Since 1953, our nation's consumption of energy has increased about 10.5 times, while the total production value of industry and agriculture (according to stable prices of 1970) increased only about 6 times; thus energy consumption has increased more than economic growth. Therefore, the energy consumed for each 100 million yuan of production value has gradually increased from 50,000 tons to over 100,000 tons, and the production value created by each ton of energy has dropped from 1,850 yuan to 960 yuan, a drop of nearly one-half.

IV. Several Opinions Concerning the Rational and Effective Utilization of Our Nation's Coal Resources

1. Improve the structure of commercial coal, increase varieties, improve quality, satisfy the needs of departments using coal

At present, the structure of commercial coal of our nation is not sufficiently rational; although washed coal is classified into many grades according to the different ash contents, actually, there are only two types of coal for smelting and other uses. The washed coal for coking consumed domestically varies greatly in quality because of the difference in the variety of raw coal. A standardized norm (mainly by the content of ash) established for washed coal used for coking in the production of metallurgical coke to supply different types of coking furnaces and blast furnaces for coking and smelting iron often cannot satisfy actual needs. The supply of coal used for smelting in large coking furnaces and blast furnaces should be superior washed coal for coking as much as possible (the ash content should be < 8-9 percent, the sulfur content should be < 0.5-0.7 percent. The ash content of washed coal for ordinary smelting should be increased appropriately to 9-12 percent, and the sulfur content should be ≤ 1.0 percent. The washed coal for other uses can be divided into several varieties according to higher ash content (including some weakly caking bituminous coal for power generation). Lump coal can also be divided into various varieties according to different grades of granularity and the different demands for variety and quality of coal by users. It can also be divided into various varieties of different quality according to the thermal value or the ash and sulfur content so that the products will satisfy the technical demands and standards for industrial coal, thus preventing inappropriate quality in the use of coal and a waste of energy.

2. Rationally adjust the prices of commercial coal, negotiate prices according to quality

At present, the price of coal in our nation is too low, only one-fourth to one-sixth the international market price of coal. The comparison of prices among different varieties of coal is not sufficiently rational. The difference in price of strongly caking bituminous coal and weakly caking bituminous coal is very small. If the comparative price of noncaking bituminous coal is 100, the weakly (medium) caking gas coal is 104, and the strongly caking fat coal is 110. The difference between 15th grade fat coal and gas coal of the same ash and sulfur content is only 0.6 yuan/ton. Comparative prices of the quality (calculated mainly according to the ash content at present) of coal is also not very rational. For example, for washed coal, regardless of the degree of difficulty of selection of washing the raw coal, for each increase or decrease of 0.5 percent in the ash content of washed coal, the price is adjusted by 1.5 percent. Generally, the selectivity of raw coal produced by most of the coal mines of our nation is relatively poor (medium difficult to difficult to select). After the ash content of washed coal has been washed to 10 percent, further lowering of the ash content in washed coal will reduce the retrieval of washed coal noticeably (each drop of 1 percent in the ash content means a reduction of 5 percent in retrieval rate; after the ash content drops to 7 percent, each further drop of 1 percent in ash content may produce a drop of 10 percent in the retrieval rate). The retrieval rate of dressing fat coal and coking coal in our nation drops more noticeably as the ash content drops. In practice, it is unfavorable to a correct evaluation of the variety and quality of coal and to fully developing the economic gain of rational utilization of coal resources if we do not base our judgment on the basic properties and the difficulty of selecting the various types of coal, if we do not take into consideration the classification of the granularity, the ash and sulfur content and the rationality and the economy of the rate of retrieval in dressing, and if we use a mechanical and uniform comparative price formula to establish the quality standards and the pricing policy for commercial coal. Therefore, to fully develop the active function of coal as the main energy, we must negotiate the price according to quality, and rationally adjust the prices of various types of commercial coal. Under set conditions, the mines and the plants can negotiate prices, sign contracts, supply coal at fixed points, and assure quality to enable both parties to actively develop production and conserve energy.

3. Suit measures to local circumstances, study and develop solid fuel of low thermal value, effectively utilize such fuel at the locality or nearby

The quality of raw coal produced in our nation is relatively poor. Each year, about 50-60 million tons of waste rocks are produced. A substantial amount of oil shale, carbonaceous shale and peat is produced. Such solid fuel of low thermal value should be effectively and comprehensively utilized locally and by nearby localities. Thus, the sources of thermal energy and power needed by the locality can be supplemented and they can also be used to fire bricks, tiles and lime, and even ash residue can be used to produce cement and light aggregate building materials. In mining regions, another effective way to develop energy and conserve coal is to appropriately process these solid fuels of low thermal value and to utilize boilers to burn them (or dry distillation) to produce steam and generate electric power (or retrieve dry distilled products). But long-distance transport must be avoided (for example, shipping 1 million tons of coal of low thermal value with an ash content of over 50 percent from the north to the south compared to shipping 1 million tons of raw coal with an ash content of about 20 percent is equivalent to additional consumption of over 5,000 tons of standard coal. Hunan and Zhejiang produce plenty of carbonaceous shale of low thermal value (stone coal). In mountain regions where transportation is inconvenient and where there is a serious lack of fuel, exploiting and comprehensively utilizing these fuels of low thermal value locally or nearby are measures worth the attention of the localities, which should implement corresponding rational measures in the development of local small industries, providing the thermal energy needed for processing industrial, agricultural and sideline products and satisfying part of the civilian fuel and power needs of the locality to gradually develop and perfect efforts to open up resources and conserve energy. It is also worth noting that some mountain regions have a rich reserve of combustible minerals such as oil shale and peat. The rational development and effective utilization of these energy resources of low thermal value require efforts to conduct surveys and research and to arrange scientific research of the resources as soon as possible.

4. In regions of relative deficiency of coal resources, the need for development and utilization of new energy is urgent

The provinces and cities of Liaoning in the northeast and Jiangsu, Zhejiang, Shanghai, Guangdong, Guangxi and Hubei in the eastern part of our nation are all regions that are relatively poor in mineral energy resources. At the same time, they are regions with relatively high industrial and agricultural production values. Because the conflict in energy supply and demand is more outstanding, the increase in the industrial and agricultural production value has been affected. For example, in 1978 and 1979, Shanghai lost 500-700 million yuan in production value per year because of a shortage of electric power and gas. According to statistics, at present, the nation has an annual shortage of about 40 billion kilowatt-hours of electricity, a loss of 70-80 billion yuan in production value (the total loss of the northeast and Shanghai is about 30 percent) and a loss of 17 billion yuan in profits. The main reason for the serious shortage in electricity is the shortage of coal. In the near future, to depend on coal to produce secondary energy sources and solve the conflict in electric power supply and demand is not an easy task that can be quickly realized. In order to solve the conflict in the supply and demand for secondary energy sources in the northeast, besides hastening the construction of coal pits to increase coal production and conserve energy, we must also consider the development and utilization of new energy sources, mainly nuclear energy. If we build a nuclear power station of 1 million kW to replace a coal fired power station, although the investment in capital construction will be onefold more, after the plant begins operation, only 30 tons of nuclear fuel are required each year; this means a conservation of the capability and cost of transporting large quantities of coal, and the expenses incurred in the investment in capital construction can be made up year after year. If surplus heat from nuclear power stations can be further utilized and if the new technology of gasification of coal is developed, the efficiency of gasification of coal and the economic gain of nuclear power stations can be improved. It has become very urgent to actively study and develop the new energy centered around nuclear energy on the foundation of coal as the main energy source in the above mentioned regions.

5. Actively develop research in systems engineering to develop and utilize energy, technical economics and new technology in coal processing

At present, there are many irrational phenomena in the utilization of various kinds of energy in our nation. The main reasons are more or less a blindness and a lack of scientific foresight in the production and rational utilization of energy. Therefore, as quickly as possible we must develop the study of systems engineering in the development and utilization of energy, including forecasting and surveying mineral resources, the techniques of building pits, the technology of construction, the method of production, and the rational distribution of energy, distribution and transportation, composition of consumption, proportion of selection, quality standards, conversion technology and environmental protection measures, etc., as well as the study of new technical paths and economic gains of developing and utilizing other new energy sources (including nuclear energy, solar energy). For coal resources, new technology for processing and utilization of coal should be studied and developed as soon as possible, including conversion of coal into clean liquid fuel (gasification and liquefaction of coal) and elimination and reduction of the sources of pollution from coal (including harmful gases, elements and organic matter).

6. Actively develop the propaganda and popularization of science concerning the rational development and effective utilization of coal resources

At present, in the development and utilization of coal, there is insufficient understanding of the different varieties, basic properties and technological characteristics of production of coal. The differences and the scientific classification of the types of coal and the quality are not thoroughly understood. There have not been conscientious surveys and studies to learn how to reach the most rational and most effective use of the various types of coal produced by each province and even each mining region and how to produce the greatest economic results. This is also a cause of irrational production and utilization. To correct this, we must strengthen propaganda and popularization of the scientific and technical knowledge of rational and effective utilization of coal so that the production departments, management and users of coal can fully understand the original basic properties of the various types of coal, the technological characteristics and the rational demands for quality in the technology of using coal to adapt to practical needs. Rational quality standards of the various types of coal for industrial use should be established. In this way, well coordinated supply and demand and rational distribution can be realized.

7. Hasten training of scientific, technical and managerial personnel, strengthen research and management of rational utilization of coal

For good rational utilization of coal, a lot of work must be done in the scientific management of production and utilization and technical reform to improve the efficiency of utilization of thermal energy. In addition, the development of new technology, such as producing gas from coal, producing oil from coal, mixed burning of coal and oil, joint cyclic power generation to prevent pollution produced by coal, environmental protection and the protection of people's health, and maintaining ecological balance all require a large amount of scientific, technical and managerial talent, and at present, the manpower engaged in these aspects is very deficient. We must begin now to grasp well the work of training personnel in a big way and develop intellectual resources. It is hoped that each department can actively take up the responsibility and quickly train a large number of people in specialized fields to contribute toward the rational utilization of coal and the rapid realization of the four modernizations.

Views on Rational Utilization

Beijing MEITAN KEXUE JISHU [COAL SCIENCE AND TECHNOLOGY] in Chinese No 5, May 1981, pp 8-10

[Article by Chen Chengxia [7115 4453 1115] and Wang Duan [3769 4551]: "Views on Several Major Problems in the Rational Utilization of Coal"]

[Text] In the development of the national economy, energy is an important material foundation. Viewing our nation's energy composition, the proportion of coal will remain at about 70 percent from now till the end of this century. Coal is our nation's major energy source. According to an analysis of the present coal production, a difference between energy supply and demand will emerge around 1985. The need for coal will increase year by year, while the production of coal will not be able to achieve a large-scale increase within a short time because in construction of coal mines the scale is small, and a long, stable period is required. Therefore, demand will outpace supply. During the coming period, improving the efficiency of utilization of energy is the most important factor of the present energy policy. Rational utilization of coal to improve the efficiency of utilization is necessary so that each ton will function more effectively and thus the goal of conservation can be achieved. Increasing the efficiency of utilization of coal as viewed at present involves the following relatively practical aspects:

I. Study Rational Dressing, Selection and Processing of Coal, Increase Varieties, Improve Quality, and Supply Coal That Meets the Demands of Users

Since the founding of the nation, our nation's coal dressing industry has developed greatly. At present, most coal washing plants dress coking coal. The amount of raw coal for washing constitutes only 19 percent of the total yield of raw coal. The proportion of dressed coal is very low, and this has a serious effect on the rational utilization of coal.

Dressing, selecting and processing coal are important links in the rational utilization of coal. After dressing, waste rocks constituting about 15 percent of the amount of raw coal can be locally eliminated. Most of the troilite is no longer brought to the user, which greatly reduces the burden on the railroads and reduces the cost of shipping, and more importantly, less troilite prevents corrosion of the equipment and reduces pollution of the atmosphere. After selection, coal of different specifications and varieties can be chosen to satisfy the needs of various users and production techniques and to improve the efficiency of utilization. Besides the need to greatly enhance the dressing of coal for power generation, the development of the selection industry must be emphasized at present in order to increase commercial coal of various qualities and granularity specifications and to avoid the distribution of raw coal. Because the locomotive uses raw coal, a large amount of pulverized coal is carried away by smoke. It is understood that the amount of coal carried away constitutes 30 to 40 percent of the pulverized coal. Each year there is a loss of several million tons of coal. Therefore, using lump coal and small lumps of coal for combustion produces good results. The pulverized coal boilers of power plants require finely pulverized coal. If raw coal is supplied to the power plants, the consumption of electricity to grind the coal has to be increased, so the cost increases and a large amount of lump coal is wasted. Conversely, the needs of users for lump coal will not be satisfied. If the more than 100 million tons of coal used by the power plants and the more than 26 million tons of coal used by locomotives at present were all selected and processed to screen out lumps of coal larger than 13 millimeters or even small lumps of coal of 6-13 millimeters for use by locomotives and other coal burning equipment, then the loss of fuel coal could be greatly reduced and the effective utilization rate of coal by locomotives and other engines could be greatly improved. Therefore, dressing by washing and selection of coal are necessary as an industrial goal. But the extent of the processing of coal must be based on surveys and studies of the situation of our nation's coal resources, the quality of coal, the selectivity of coal, the technical requirements, the combustion equipment of the user, and technical and economic results, and it must be implemented in one region and one mining area at a time. The relationship between the effective utilization of coal resources and the dressing and washing of coal and the rate of retrieval of washed coal must be studied. To rationally utilize resources, the quality of coal must be evaluated on an overall basis in order to determine the most rational number of grades of coal. According to the results of utilization by the users and the supply capabilities, we must first satisfy the major users and distribute to users on the basis of major users first and then secondary users. To improve the results of utilization of coal, this work must be actively developed, and it is an aspect of work that has been effective.

II. Study and Improve the Various Combustion Techniques, Improve the Efficiency of Combustion

Improving the efficiency of utilization of coal is closely related to the equipment utilizing coal and the combustion technique. Improving the quality of coal can of course improve the efficiency of utilization, but it has its limitations. Improving the combustion technique is an important measure to improve the efficiency of utilization of coal on a large scale. Our nation produces 600 million tons of coal a year; nearly 100 million tons of coal are used as raw material and fuel for coking and synthesizing ammonia. Most is used as fuel. Burning by layer not only has a low thermal efficiency, but it also produces great waste. At present, the burning efficiency of pulverized boilers at power plants is relatively high. For example, the Tangshan Power Plant has been burning and dressing medium-grade coal for a long time, and the thermal efficiency reaches 80-90 percent. Coal used by the ordinary layer combustion furnace has a high ash content, granularity is small, resistance is high, and air does not easily come into full contact with the combustible organic matter. The coefficient of surplus air is large, the thermal efficiency is low, and in particular, certain vertical boilers and small civilian stoves burn bituminous coal with a high volatile fraction. The coal burns at the bottom and undergoes dry distillation and thermal decomposition at the top, emitting large amounts of volatile substances and coal tar. These products that have not fully burned are exhausted from the smokestack. The fuel has not been fully utilized and this causes serious environmental pollution. Therefore, studies to improve combustion techniques, especially studies to improve the presently available medium-size and small boilers and civilian stoves are very significant for conserving coal and improving efficiency. Take coal for civilian use as an example: studying top-lit honeycomb coal and the structure of the stove or gradually expanding the supply of anthracite of low-volatile fraction and low sulfur and semicoke so that thermally decomposed products burn fully can improve thermal efficiency, and compared to the thermal efficiency of 15-20 percent (calculated on the basis of a gasification of 60-70 percent, a combustion efficiency of 55-60 percent of coal gas), and is more beneficial to environmental protection. But the investment in capital construction needed to develop urban gas is large, and in our nation's present technical and economic conditions, it is very difficult to rapidly develop urban gas within a short time. Up to now gas in our nation is available to only 15 percent of the urban population. The use of coal as the main source to produce gas fuel will not increase in the short term.

According to our nation's actual situation, suiting measures to local circumstances is a more practical energy conservation measure at this time. The first consideration should be how we can concentrate a definite force to study the various combustion techniques and improve the efficiency of combustion. Although definite progress is being made in this regard, the force is relatively weak, there is insufficient emphasis, and it is far from satisfying the demands of the present development in production. While studying and considering major long-range technical problems that have the possibility of being solved within a short time. We must start out from our nation's actual situation so that new techniques for rational utilization of coal can be found continuously.

III. Develop Enterprises of Comprehensive Utilization Centered Around Coking, Produce Coke for Various Uses, Retrieve Coal Gas for Synthesis and for Civilian Use

Our nation is rich in coking coal resources and the proportion for exploitation is large; the yield of coking coal, gas coal, fat coke, and black jack constitutes about 48 percent of the nation's yield of coal. But the amount of coal washed constitutes only one-fourth of the raw coal for coking. Large amounts of coking coal cannot be rationally utilized. It is characteristic of our nation's coking coal that the proportion of gas coal is larger and the rate of rejection is high. On the basis of this characteristic, in order to rationally utilize these coking coal resources, it is necessary to further develop many methods of comprehensive utilization centered around coking; to produce coke for various uses, including metallurgical coke, chemical industry coke, and coke for civilian use; and to retrieve various chemical products and large amounts of coal gas for use by the chemical industry in synthesis, for civilian use, and for use as industrial fuel.

Our nation's coking industry developed rather quickly during the 1950's and 1960's. At present, the production capacity of mechanized coking furnaces already reaches over 30 million tons, but they mainly produce superior quality metallurgical coke. Because of the singularity of the variety, a large amount of superior quality metallurgical coke had to be used by the non-smelting industries, lowering the results of utilization. The amount of metallurgical coke produced each year is not small, but the metallurgical departments still experience a shortage in the supply of coke. At present, some departments still have to expend a lot of effort to study the use of weakly caking coal and noncaking coal to produce formed coke that does not have a high quality. This has caused a big waste of energy and power. At present, the degree of comprehensive utilization of coke products and coking furnace coal gas is poor. During the beginning period of the 1960's, plans to establish some joint bases of metallurgy-coking-chemical engineering were drawn up many times, but up to now none has been built. Our nation still produces large amounts of indigenous coke: over 10 million tons are produced each year. This type of indigenous coke has a coke forming percentage of only about 60 percent, and the ash content of the coke is generally higher than 20 percent. Nearly 50 percent of the organic combustible substances in raw coal are burned away: this is a big waste of energy and it seriously pollutes the environment.

To more effectively utilize coal resources rationally and conserve energy, our nation has already prepared a definite scientific and technical and industrial foundation. Indigenous coke furnaces should be gradually phased out, and small coking furnaces should also gradually undergo technical improvement. On the basis of the distribution of coal resources in our nation and technical conditions, developing urban gas is a possible direction; from the standpoint of the application of gasification furnaces in industry, only the Lurgi process of furnace gasification technique is sufficiently mature at present, but the Lurgi furnace requires lumpy brown coal and noncaking or weakly caking coal as raw coal, with a granularity of 6 to 50 millimeters. Resources of this type are very unevenly distributed in our nation; they are located mainly in Neimengol, and in the northwestern, northeastern and southwestern border regions, while reserves of this type of coal near the large cities are small. Only cheap brown coal should be used to produce urban coal gas of medium thermal value because it is economically more rational. This point needs to be considered. Because of the actural situation in our nation, besides developing the Lurgi furnace gasification technique in places where conditions are favorable, gas coal with a stronger caking property should be used more as raw material, by suiting measures to local circumstances; technically mature coking furnaces or vertical continuous coalification furnaces should be developed, producing coke and coal gas at the same time. Practice shows that the least expensive way to produce coal gas is in coking furnaces, so developing coking is an effective way to comprehensively utilize coal at present.

IV. Improve the Presently Available Gasification Techniques, Study New Techniques of Coal Gasification

In industrial production, the main use of coal is to serve as fuel for boilers and kiln furnaces. But for some industrial kiln furnaces, such as the open hearth furnace for steel making and the glass pool kiln and some other heating furnaces, only gaseous fuels can be used. Some industrial kilns can use coal directly as fuel, but the thermal efficiency is low, control is difficult, and the various technical demands are not easily satisfied, so product quality is affected and the environment is polluted. Industries within modern city limits abroad almost entirely use gaseous fuels.

The techniques of gasification of solid fuels which are technologically mature have already entered the commercial stage. Based on the different methods of contact between the gasifying agent (air, oxygen, steam) and coal, they can generally be divided into three major categories: the stationary bed, the fluidized bed and the air flow bed. Each gasification method requires a distinct quality of coal. The stationary bed coal gas generating furnace used both abroad and domestically requires a high quality of solid raw coal. For example, the granularity, moisture content, ash content, volatile content, sulfur content, slag forming, ash melting point, caking property, thermal stability, mechanical strength, and chemical activity all directly affect the normal operation, intensity of gasification, and technical and economic results of the gasification furnace. The stationary bed coal gas generating furnace has already developed into an important part of our nation's industrial energy. According to incomplete statistics, there are nearly 100 coal gas generating stations in our metallurgical machinery, building materials, chemical industry, and light industry departments. Some 500 units of fuel coal gas generating furnaces have been installed. It is estimated that they consume 4 million tons of coal each year and they have served greatly in industrial production. In the past, the shortage in the supply of lump coal and coke affected the development of this type of gasification furnace, and so some gasification furnaces were converted to burning oil. Now, because of the shortage of petroleum resources, the use of coal gas has begun to develop again. Therefore it is necessary to study the K-T furnace and the slag smelting furnace and such new pulverized coal gas production techniques in a big way and to expand coal resources for gasification and improve the efficiency of gasification. In view of the actual technical conditions of our nation at present and because the K-T furnace pulverized coal gas production requires a lot of oxygen, the investment and cost are high, so the gasification technique still requires further improvement. Therefore, the function of the various types of stationary coal gas generating furnaces presently available still needs further development. The problem is how to study and expand the resources of large lumpy coal and coke for gasification, how to carry out technical reform of the presently available gasification equipment, how to improve the level of automation, and how to handle the three wastes so that the presently available stationary bed coal gas production technique can be revived to realize further development.

In summary, we realize that rational utilization of coal, improving the efficiency of utilization of coal, and energy conservation are broad questions and there is a lot of work to be done, but in order to invest less, to produce quick results, and to be practical, we must start out from the characteristics of our nation's coal resources, from the presently available technical conditions and material foundations; long-range research work must be carried out, practical problems must be solved, and efforts that can change the present situation should be given sufficient emphasis.

Role of Shanxi Production

Beijing DILI ZHISHI [Geographical Knowledge] in Chinese No 3, 1981 pp 2-3

[Article by Cao Wenlong [2580 2429 7893]: "The Home of Coal--Shanxi Province"]

[Text] From the "Geological Distribution Map of Shanxi Province," one can see that Shanxi is indeed a world of coal, or a sea of coal. Rich coal resources can be found from east to west, from north to south. No wonder Shanxi has long been known as the "home of coal."

Shanxi's immense coal reserves are distributed from the source of the Sanggan River on the plateau beyond the Great Wall to the vast expanse of fertile land along the banks of the Fen River, and from the towering Taihang Mountains to the verdant Luliang Mountains. Its proven coal deposits are up to 200 billion tons, and the predicted coal deposits are over 800 billion tons. Shanxi is the richest coal province today. It not only ranks first in coal reserves, but its coal deposits are also scattered over a vast territory. Within the entire province's 156,000 square kilometers of land, there are 58,000 square kilometers of coal reserves, accounting for 37.2 percent of the province's total area; and 94 of the 105 cities and counties in the province have coal resources.

Shanxi coal has quite a few excellent features: first, there is a wide variety of coal, e.g., coking coal, power coal, and anthracite, which account for about half of these categories of coal deposits throughout the whole country. There is also a whole range of coking coal, i.e., primary coking coal, lean coal, fat coal, gas coal and other high-grade varieties. Besides, lignite is used in many ways and is one of the chief raw materials of the chemical industry. Second, the coal is of high quality. The majority of the Shanxi coal is of low ash content, low sulfur content, and high calorific capacity, and it is thus suitable for both industrial and civilian uses. Lanha coal, which is produce in Jin County, known both at home and abroad for its clean, high combustible and high calorific qualities. In the past it was used to light the fireplaces of imperial palaces in some West European countries. Third, the geological structure is rather simple. In general, the coal seams are fairly shallow and gently inclined with only a few heaving sand layers and faults, which makes it possible to construct mines at high speed and exploit the resources at low cost. The time generally required for constructing a medium-size pit in a geologically complicated region is sufficient to build a large mine shaft in Shanxi.

Classified according to the characteristics of the geological structures, there are eight major coalfields in Shanxi, i.e., the Xinshui, Xishan, Huoxi, Hedong, Datong, Ningwu, Wutai and Hunyuan coalfields. The Xinshui coalfield is located in the southeastern and central parts of Shanxi, and a large portion of Linfen District as well. The Taihang Mountains run along the eastern and southern sides of the coalfield, while the Huo and Hutai mountains lie to the west and north respectively. It is called Xinshui Depression based on geological structure. Both the Xishan and Huoxi coalfields are situated in synclinal structures. The coalfield west of the Luliang Mountains is located along the border of the Shanxi-Gansu-Ningxia (or Ordos) Basin, and because of its location west of the Yellow River, it is known as the Hedong [River East] coalfield. The Datong coalfield and the Ningwu coalfield are located in the geological structures of the Datong and Ningwu sedimentary basins, extending in an east-northeast direction. The slopes of the strata along the edges of the basins are fairly steep, but the strata in the central portions are gently inclined. The Wutai and Huoyuan coalfields are also situated in intermontane synclines. These geological structures help to preserve the coal seams.

Each of the eight major coalfields in Shanxi has its own unique feature. The Xinshui coalfield covers an area of nearly 30,000 square kilometers; it is the largest of Shanxi's eight major coalfields and one of the major coalfields in the world. The Hedong coalfield ranks second in size, covering approximately 17,000 square kilometers, but in terms of exploitation and utilization, it is still no match for the other coalfields. Next in line are the Huoxi, Datong, Ningwu, and Xishan coalfields. Although the Wutai and Hunyuan coalfields are smaller in size, they are regarded as a pair of precious 'black stones' by the residents in the mountain area as well as by the developers of local industries.

Long History of Exploitation

The history of coal exploitation in Shanxi goes back a very long way. It is said that "Nuwoshi" melted stone to repair the sky, and left the remains of the stone of Fu Mountain in the eastern part of Pingding County in Shanxi. According to "The Coal Geology of Shanxi," the Shanxi people began to dig out coal by hand 2,000 years ago, in the Han Dynasty. In a book entitled "Pilgrimage to Tang In Quest of the Law," it is written: "Exit from the western gate of Taiyuan Prefecture...travel west for 3 or 4 li to a mountain called Jinshan (note: now known as Xishan); there is a stone coal all over the mountain, and people come here from near and far to gather it as fuel for cooking. It is extremely flammable, and remain as tone coked into coal. So it is said that the fire [stones] from heaven can be burned." By the Song Dynasty, coal mining thrived and flourished.

In "The Outline for Construction of the Country." Mr Sun Zhongshan [Sun Yat-sen] proposed the following guidelines for industrial planning: "Shanxi's inexhaustable resources of coal and iron should be exploited extensively." However, it was not until the whole country was liberated that Shanxi's coal exploitation really got underway and became one of the major projects of the country. In 1949, the raw coal output of the whole province was only 2.6 million tons. During the period of the first 5-year plan, the newly enhanced productive capacity of Shanxi's coal industry accounted for 15.7 percent of the coal production of the entire country. It became 10.5 percent during the period of the second 5-year plan, 9.4 percent during the 3-year adjustment period, 9 percent during the third 5-year plan, and 11.3 percent from 1971 to 1977. It took more than 30 years of construction to set up a large-scale coal mining network. Today, the province already has 13 state controlled coal mines, such as Datong, Yangquan, Xishan, etc, and 182 local coal mines run by the provinces, district (municipality) or county (prefecture), as well as more than 2,000 small coal pits run by the commune or brigade. Last year, the raw coal output of the entire province topped 100 million tons, which was approximately one-sixth of the whole country's raw coal output, ranking first among all the provinces, cities and autonomous regions throughout the country. Moreover, Shanxi accounts for more than 50 percent of the coal output provided to the state by the various provinces, cities and autonomous regions, and Shanxi coal also accounts for more than half of the nation's coal for export. Shanxi also provides the country with more than 70 percent of the profits gained from the coal industry throughout the whole country. Shanxi not only produces enough coal to meet the needs of its own industrial and agricultural production as well as its inhabitants, it also supplies coal to more than 20 other provinces, cities and autonomous regions throughout the country. At present, coal is the top energy source of our country, and Shanxi is one of the strong supporting pillars of the nation's energy sources structure.

A Preliminary Energy Base

The impetus of the coal industry has helped to bring about the rapid development of Shanxi's electric power, coal chemical industry, metallurgy, machine building and light industry. To enable Shanxi's coal industry to contribute much more to the nation's four modernizations program, it was proposed at the Fifth People's Congress of Shanxi Province last December to build Shanxi into a strong energy base serving the entire country. To achieve this end as quickly as possible, with the support of the state, operations have already begun to construct a huge coking coal base in the Gujiao mining district with a projected capacity of 16.5 million tons, in the Guishigou mining district in Yangquan with a capacity of 4 million tons, and at the Yanzishan coal mine in Datong with a projected capacity of 4 million tons. The Ping(lu)-Shuo (Xian) open pit coal mine will be developed as a joint venture project with the United States. Also, in such large-size minesite power stations as the Shentou power plant, Datong power plant No 2 and Niangziguan power plant, some generating units have already become operational. Shanxi will also begin to build a large chemical fertilizer plant with imported equipment. These magnificient engineering projects will add strength to the Shanxi energy base.

The rapid development of Shanxi's coal industry will open up bright prospects for the Shanxi energy base. With the growth of the coal industry, Shanxi is vigorously developing mine-site power stations which will transmit strong electric current to Northern, Central and Eastern China. Shanxi will also energetically develop a coal chemical industry which will utilize the coal resources to make synthetic fibers, synthetic plastics and synthetic rubber, and change the structure of the industrial raw materials in Shanxi. Moreover, Shanxi is also capable of developing nonferrous metal industries which are heavy energy consumers, and it can make maximum use of its rich resources of aluminum, copper and iron, thus reversing the backward state of Shanxi's nonferrous metal industry.

With the changes in energy sources structure and the development of science and technology, the utilization of coal will become much more extensive. By then, Shanxi should be able to contribute a great variety of coal products to the nation's four modernizations. Shanxi will be a powerful energy base that will rank among the largest coal energy bases in the world, such as the Appalachians of the United States, the Dunbas of the Soviet Union, and the Rhur of West Germany.

Shanxi Work Conference on Coal

Taiyuan SHANXI RIBAO in Chinese 10 Apr 81 pp 1, 2

[Article by SHANXI RIBAO correspondent: "Greater Coal Extraction for the Four Modernizations"]

> [Text] The Shanxi provincial work conference on coal urged all coal mine workers to enhance their glorious tradition of fighting spirit, to make courageous contributions to stabilizing the national coal production at 600 million tons per year, to reaching the 110-million-ton coal production goal called for by the government, and to speeding up the pace of readjustment and mine shaft construction.

It was determined at the Shanxi work conference on coal that all coal mine workers in Shanxi should be organized and mobilized to enhance the glorious tradition of their characteristic fighting spirit in order to insure that the national coal production level is stabilized at 600 million tons per year. The workers were urged to keep the national situation in mind, assume heavy responsibilities and contribute their effort to accomplish the 110.44-million-ton coal production mission assigned to Shanxi by the government. They were also called upon to speed up the pace of readjustment, increase the rate of new mine construction, strive to boost income and cut spending, and accumulate and conserve more capital for the nation.

The Shanxi work conference on coal production was held from 26 March through 3 April in Taiyuan. It was attended by 350 officials, engineers, technical personnel and professional cadres of various provincial and local state-operated coal mines. All the comrades attending the conference agreed that the conference was a success and that it was held at just the right time. The aim of the conference was to learn further how to carry out the spirit of the central work conference. By consolidating the experience, analyzing the situation, communicating with each other and deciding what measures to take, the conference put the tasks of speeding up the pace of readjustment and new mine construction proposed at the national work conference on coal production on a solid basis. It was also a conference that raised the spirit, strengthened the confidence and promoted the objective of making Shanxi a strong coal energy base as soon as possible.

During the conference, comrades in charge of the Shanxi CCP Committee and the provincial people's government attended and addressed the conference.

The conference advanced the belief that whether the mission is to accomplish the current coal production goal as assigned or exceed the requirement or to accelerate the construction of the coal energy base, one must have a vision of the overall picture and view the local situation accordingly. There should be a clear understanding of the role and function of Shanxi's coal in the national energy production. Last year Shanxi's coal production amounted to one-fifth of the national total, and more than 73 million tons of coal were transferred out of Shanxi, that is, more than half of the inter-provincial coal transfer in the entire nation. At present, some 200,000 tons of coal are transferred out of Shanxi every day. This has an important role and function in supporting the energy demands of more than 20 provinces and municipalities. In order to stabilize the national coal production at the 600-million-ton level, the coal production assignment given to Shanxi for this year is larger than that planned last year. Moreover, the readjustment and new mine construction assignments are also heavier than predict anticipated, but all these assignments are required by the overall situation and their accomplishment is necessary. As for the conditions to accomplish the mission, the discussion and analysis at the conference led to the unanimous opinion that the favorable conditions and supportive factors are many and that they predominate. Unfavorable conditions and difficulties along the way do exist, but they can be changed with enough effort and the practical difficulties can be overcome. Especially important are the support, guidance and coordination provided to the production construction of the Shanxi coal industry by the central government and various departments in the province. Even though the national financial situation has encountered difficulties and the capital construction investment has been cut substantially, the capital construction investment allocated to the state-operated coal mines in Shanxi for this year is still some 22 million yuan more than that of last year. Equally strong national support is also given to production equipment, technical guidance and other areas. Various branches and departments within the province also provide their services in the manufacture and maintenance of mine equipment and in the improvement of transportation conditions and supply of commercial goods in order to actively support the production and readjustment of the coal mines and to help build a coal energy base.

The conference members also expressed the belief that after a long-term effort, Shanxi has formed a coal industry structure that combines large, medium and small operations. The state-operated large mining bureaus produce more than half of Shanxi's total coal production and they are the backbone of this industrial structure. The proper policy of combining the large, the medium and the small must be insisted upon if we are to insure the fulfillment of the national goal of upgrading the coal industry and accelerate the progress of building an energy base. We should not only advocate that the small mines respect the large mines, not compete for resources with the large mines and not cause problems to the large mines, but we should also advocate unified planning and regulation by the large mines so that the large mines help the small ones. Mines of various sizes should all have their readjustment period; all mine workers must grasp the main points from a pragmatic viewpoint. The local communes and teams should pay special attention to strengthening their safety procedures, improving their mining methods, raising their disaster-resistance ability and resource recovery rate, and protecting the workers' safety and the national resources. All coal mines in the province should insist on the "safety first" policy and establish a rigorous responsibility system for safe production. Safety regulations should be carried out conscientiously and safety measure engineering projects should be given high priority and completed first. Great efforts should be made to improve safe production in preparation for the national coal mine safety recognition conference to be held in Shanxi.

It was unequivocally pointed out at the conference that the basis for making a greater contribution and for accomplishing this year's coal production and construction assignments on schedule and ahead of schedule lies in the firm stance on the four fundamental principles and the directions and policies of the Third Plenary Session of the Party Central Committee. It also lies in strengthening the political thinking, the leadership and the working staff. We should maintain the system whereby bureau and mine directors are responsible to the leadership of the party committee and fully exploit the efforts of party organizations of various levels and party members serving as the central and leading examples in production and construction. Engineering and technical personnel should develop their function to the fullest extent and make great efforts to strengthen scientific research and full staff training. Competition in style and contribution should be advocated; being on the front line in the mine shaft, finishing all the assignments and not missing any work should be recognized. We should be proud to learn culture, science, technology and management. We should be proud to follow orders, obey rules, to be civilized and to have good manners. The comrades participating in the conference looked back on history and talked freely about their accomplishments. They are vivid evidence of the fact that Shanxi coal mine workers are a team who love the party, socialism, and their posts. They are also a team with a lot of practical experience and are able to endure great hardship, a reliable team that are not afraid of difficulties, that are courageous, and that have a vision of the overall picture. These are reliable insurance for constantly creating new results and accomplishing new victories in our progress ahead.

Energy Base in Shanxi

Taiyuan SHANXI RIBAO in Chinese 10 Apr 81 pp 1, 2

[Editorial: "Making Shanxi a Strong Energy Base"]

[Text] In the relationship between the local situation and the overall situation, the overall situation dominates and the local situation is a part of the entirety and should serve the overall situation. Any department or region and any task in the revolution are parts of the whole. To truly understand the role of the local situation and to make it function properly, one must view the role and function of the local situation as part of the overall situation and understand the relationship among various local situations. Lenin quoted Hegel in his "Philosophical Notes": "The various parts of a body are what they are only when interconnected. A hand without the body is only a hand in name." This vividly illustrates the inseparable nature of the parts and the whole. The parts can function fully only in serving the whole.

The advantages of Shanxi Province are that we have a rich reserve of coal and we contribute a large production of high quality coal of all varieties. In order to further exploit these advantages, we must consciously view the local situation from the standpoint of the national situation. The nation has assigned Shanxi the mission of producing 110.44 million tons of coal in 1981, 6.19 percent more than under the 1980 production plan. In the meantime, we are required to accelerate the pace of readjustment in the coal mines and the rate of constructing new mines. We must carry out the honorable and difficult tasks of completing a large number of engineering projects on safety measures, on improving the linkage ability, and on new mine construction. We also need to accumulate and conserve capital for the nation wherever possible. All these tasks are aimed at stabilizing the national coal production at the 600-million-ton level and to insure a daily transfer of 200,000 tons of coal out of the province to support the energy needs of the nation. These tasks are necessary for the further readjustment of the economy and further political stability--in other words, for the needs of the overall situation. Essentially, to exploit the local advantages from the viewpoint of national needs is to act objectively and to wield the superiority of the socialism system.

In making use of the local advantages for the national cause, in accelerating the pace of readjustment and mine construction, and in completing and exceeding the coal production assignment for 1981, the most important thing is to conscientiously and thoroughly carry out the spirit of the Central Work Conference and, under the guidance of the policies of the Third Plenary Session of the Party Central Committee, to mobilize and organize the vast ranks of coal mine workers and to develop the honorable tradition of a special fighting spirit. The spirit of being unafraid of hard and tedious work, of being proud to be a coal mine worker contributing to the four modernizations should be highly publicized. We should also publicize the spirit of obeying discipline, following orders, not missing any work and completing all the assignments. Be proud to learn culture, science, technology and management. And be proud to be civilized and good mannered. Based on the special circumstances of the coal mines, combine the tasks of solving thinking problems with those of solving practical problems and combine the general education with the idea of each individual doing his job well. Recognition should be given to achievers and their accomplishments should be publicized to establish a model for others to learn from. Socialist labor competition should be broadened and deepened in order to guide the vast ranks of coal mine workers to become models of maintaining the four fundamental principles, of building the spiritual civilization of socialism and of creating new records in production.

In the process of making Shanxi a strong energy base as soon as possible, the industrial structure and the entire economic structure of Shanxi need to be changed step by step. Further development of the coal industry must rely on the development of agriculture, light textile industry and science and technology. Within the heavy industry, there are already changes toward serving the construction of an energy base. The communication and transportation departments are also strengthening the existing railroads and highways and constructing new roads to accommodate the transfer of coal from the province. The commerce and service departments have also done extensive work to improve their service and supply to the mining community and have accumulated useful experience. All in all, a large-scale provincewide socialist collaboration involving all the relevant branches and departments is taking form in making Shanxi an energy base for the cause of the national situation. This large joint effort in socialism, capable of creating new production power, certainly will continue to grow and develop in the course of further promoting economic readjustment and political stability. This effort will consistently provide the coal industry and the coal producing workers with firm support and coordination by various branches.

Stalin once said that coalminers sacrifice their own sunshine and give light and heat to the people. The 400,000 coal mine workers are a heroic team that love the party, socialism, and their posts, they are a team that are unafraid of hard and tedious work. It is this team that have mined a cumulative total of more than 1.3 billion tons of coal and accumulated 6 billion yuan of construction capital for the nation. They have plenty of practical experience whether they are mining with advanced machines in large and medium-size modern coal mines or producing coal by traditional methods in small coal mines. The tasks before us now are to consolidate the exchange of experience and to further strengthen the team by grasping well the training of all personnel and continually raising the political understanding, technical level, and the sense of organization and discipline of the coal mine workers. This is the most important work in building an energy base and taking advantage of a local situation for the cause of the national situation. We hope that all the coal mine leaders are determined to make great efforts to carry out the very important foundation work of building up the best possible team of workers.

EFFORTS TO STEP UP SUPPLY OF COAL GAS TO CITIES REPORTED

Coal Gas Company Initiative

Beijing BEIJING RIBAO in Chinese 8 Apr 81 p 1

[Article by Liu Tingzhao [0491 7200 2507]: "Coal Gas Company Takes Initiative and Provides Fast Installation for Dozens of Units"]

[Text] After a discussion on how to "serve the people and be responsible to the people," the municipal Coal Gas Company has taken the initiative and is striving to eliminate procrastination in coal gas installation and speed up the installation engineering in the residential areas of Jinsong and Tuanjie Lake, where 12 locations have now been officially supplied with gas.

The installation of a coal gas supply for civilian, educational, commercial and service units in the Jinsong and Tuanjie Lake residential areas involves a large amount of work and a number of departments; overall organization and planning are required. In the beginning, it was suggested that the largest unit--the Tuanjie Lake General Merchandise Store--should take the lead. This store submitted, however, that it is a peer unit to other stores and could not assume a leading role. The stores suggested that their superior, the Chaoyang Ward financial management, should take the lead. The financial management was concerned that units under its jurisdiction might become reliant upon the ward and cause the ward financial losses. Then everybody expressed the hope that the Coal Gas Company would take the lead. The thinking at the Coal Gas Company was that in installing a gas supply, the usual procedure has been that the customer made the request and the company carried out the installation. It was not the company's responsibility to come out and help solve problems among the customers in installing a gas supply. Besides, some of the units were short of materials and funds; if the company were to take the lead, it would have to look for the capital and materials, and it would obviously be taking on an additional burden. So the Coal Gas Company did not want to take the lead either. Since the burden was passed from one unit to another and nobody wanted to assume the responsibility, coal gas installation for these units was progressing very slowly, with delays as long as 6 months. Some schools, stores and service posts delayed opening for business, which affected the move-in schedule and the daily life of the residents.

In the "serve the people and be responsible to the people" discussions, leaders of the Coal Gas Company changed their old passive attitude of "waiting for others to call us, we don't call them", took the initiative and coordinated well with other units. Late in February, the Coal Gas Company held two "coordination meetings for local coal gas engineering" and invited the comrades in charge at the Chaoyang Ward grain bureau, nonstaple foodstuffs company, education bureau and a dozen other units to discuss the coal gas connection for the 3 schools and 36 commerical and service units in the Tuanjie Lake and Jinsong residential areas. At the meetings, the gas company open-mindedly solicited the opinions of the units and, based on customer requests, grouped and ranked the coal gas installation for all locations according to the size and urgency of the projects. Comrades in charge and technical personnel were immediately dispatched to the network points to make on-site investigations and surveys and to work with the customer in completing a concrete construction plan. Because seven service units at Tuanjie Lake will share the same coal gas pipeline in the same building, conflicts would be likely to occur if the pipelines were installed improperly. The Coal Gas Company held discussions with the customers at the installation site and took the proper technical and safety measures to determine the layout of the coal gas pipelines and the furnaces. By doing so, the seven units had a common understanding of the project and that insured the normal progress of the installation.

The Coal Gas Company played a leading role not only in organizing the work but also in actively helping the customers to overcome some of their actual difficulties. According to the regulations, the requesting customer must have the funds and construction material ready before the Coal Gas Company can accept the installation job. But the post office of the Jinsong residential area does not have any construction material and the sixth elementary school of the area does not have any funds. The Coal Gas Company came up with pipes, construction materials and parts intended for their own repair and maintenance use and also made a 2,500-yuan advance for the sixth elementary school so that the gas installation at these two places could be carried out.

New Taiyuan Coal Gasification Company

Taiyuan SHANXI RIBAO in Chinese 2 Jun 81 p 1

[Article by Zhou Enying [0719 1869 5391]: "Taiyuan Coal Gasification Company Officially Founded"]

[Text] The Taiyuan Coal Gasification Company, to be operated jointly by the Ministry of Coal Industry and the Shanxi Province government, has recently been approved by the State Council and officially founded. Establishment of this company will greatly speed up the coal gasification construction in Taiyuan city, and the wishes of the people of Taiyuan for a coal gas supply as quickly as possible and for rapid elimination of environmental pollution will soon be realized.

The principal missions of the Taiyuan Coal Gasification Company are to supply coal gas to Taiyuan city and to carry out integrated utilization of coal. The coal gasification construction engineering includes mining and washing of coal, gasification and pipeline network. Capital needed in the construction is invested by both parties in the joint operation--the Ministry of Coal Industry is responsible for the mining and washing of coal and the Shanxi Province government is responsible for the gasification and the pipeline network. In order for Taiyuan to realize coal gasification in stages and installments and to obtain the optimum economic effects, unified planning, design, construction and operation will be adopted. For this reason, a civilian coal gas supply from chemical plant and mine recovery will aslo be under the unified management of the Taiyuan Coal Gasification Company.

The Ministry of Coal Industry and the Shanxi Province government decided that multiple gas sources are required to provide a coal gas supply in Taiyuan city. The first step is to exploit the advantage of abundant coking coal around the city, gradually build up a coking plant that produces 1.8 million tons of coke per year, generate coal gas in the coking process, and export the coke and retain the coal gas for use in Taiyuan city. The goals of the coal gasification are to supply coal gas to the majority of the 1.2 million urban population, convert coal burning to gas burning in plants that are in the position to do so, and fundamentally solve the air pollution problem of Taiyuan. The engineering construction for coal gasification should be carried out in two steps based on the spirit of orderly progression and within the capabilities. The first step is to build a gas-producing coking oven of a capacity of 400,000 tons per year as quickly as possible so that household gas can be supplied to one-third of the Taiyuan residents. The second step is to build another gas-producing coking plant with a capacity of 1.4 million tons per year in order to provide coal gas for the household use of 1 million Taiyuan residents and some of the plants. The principal gas production equipment and refractory material for the 400,000-ton coking oven are already on hand and the preliminary design has also been completed. Contracts for water, electricity, transportation, land and material have all been signed and preparatory work prior to construction will basically be underway in 1981. Efforts are being made to have the official ground-breaking in 1982.

Moreover, the recovery, purification, external gas storage tank and supply pipeline network engineering projects of other gas sources under the unified management of the Taiyuan Coal Gasification Company, such as the coking oven residual gas and the methyl alcohol blowout gas at the Taiyuan Chemical Fertilizer Plant, started in December 1980. First-stage construction engineering is expected to be completed before the National Day in 1981; the 15,000 households located between the chemical fertilizer plant and Xiayuan will be the first users of the coal gas coming from the chemical fertilizer plant. When the second-stage engineering is completed in 1982, an estimated 40,000 families will be supplied with coal gas. The first stage of the paraffin-splitting liquefaction gas engineering at the Taiyuan Detergent Plant is completed except for the technically more difficult assembly of the compressor facility. It is expected to be completed and come on line before the National Day.

REVIEW, OUTLOOK FOR HYDROPOWER DEVELOPMENT DISCUSSED

Eastern Power Grid

Beijing SHUILI FADIAN [WATER POWER] in Chinese No 1, 12 Jan 81 pp 4-7

[Article by Yang Degong [2799 1795 0501] of the Survey and Design Academy Under the Ministry of Electric Power Industry: "Review of and Outlook for Hydropower Development in Eastern China"]

[Text] I.

The water energy resources in the six provinces and one municipality of Eastern China form only a very small part of the national potential. However, they were developed rather early. Construction of the hydropower stations at Huangtankou in Zhejiang and Gutianxi in Fujian began one after another shortly after liberation. Because of the lack of experience in the construction of large and medium-size hydropower stations, problems soon cropped up and we took the wrong path. With the establishment of the General Bureau of Hydropower Generation under the Ministry of Fuel Industry, leadership over hydropower construction was strengthened and during the first 5-year plan, large and medium-size hydropower stations were built at Shangyoujiang, Gutian, Huangtankou and Xinanjiang, giving us valuable experience. In addition to supplying electricity for industrial and agricultural production in various regions, these construction projects also played an important role in building up a hydropower construction contingent. Even now, the one-level two-stage construction at Xinanjiang, Shangyoujiang and Gutian enjoy high prestige because of their short construction periods, fine work quality and small investments.

By 1979, hydropower stations completed and under construction in Eastern China (excluding those below 500 kW) were capable of exploiting 22.5 percent of the water energy potential, and there are large and medium-size hydropower stations of around 9 million kW and small stations of more than 5 million kW to be exploited later. If the potential in Eastern China can be fully exploited, there will be an average annual power generation of 51 billion kilowatt-hours. At the consumption rate of 400 grams of standard coal per kilowatt-hour, this is equivalent to a large coalfield with an annual output of 20.4 million tons of standard coal for a long time.

Hydropower construction in Eastern China has not been smooth sailing. During the Great Leap Forward in 1958, the "three simultaneous" [simultaneous design, construction and operation] was vigorously enforced because of the evil influence of the "wind of exaggeration" and high targets. The construction sites were determined hastily and the construction of many large and medium-size projects was started at the same time, even though the scope of work undertaken was beyond the limits of our national financial and material resources. This was followed by 3 years of difficulty and the construction had to be halted, resulting in great waste and loss. The lessons learned from such rash action, disregard of capital construction procedures and failure to concentrate efforts on specific jobs should be learned well.

When construction was resumed later and the closed or suspended large stations had to be dealt with, no serious analysis or research was carried out on the long-range strategic layout for hydropower development. Furthermore, no clearcut policy decision was worked out on such questions as whether the construction of Oujiang Hydropower Station in Qingtian County, Zhejiang, or the Jianxi Station of Fujian should be continued at a reduced scale, even though heavy investments had been expended on them and people had already been mentally prepared for the removal of homes from the reservoir areas. Thus everything remained in suspense pending a protracted review of the plans for the river basins. Finally, the projects in Qingtian and Jianxi were criticized as typical examples of grasping for things grandiose and foreign, and since then, nobody has ever proposed the resumption of the projects according to the original plans. The time has now changed, the population of the reservoir areas has swollen; and production and construction in both urban and rural areas are undergoing large-scale development. However, it is no longer possible to build these large hydropower stations according to the original plans. At present, there is a compulsory revision of the plan for the development of the Oujiang River basin so that the single-level dam in Qingtian can be developed as a multilevel dam. In terms of energy, this means there has been an annual loss of more than 700 million kilowatt-hours of electricity and a 4 million kW capacity. The case of the Jianxi Hydropower Station is even worse. This is a key project in the strategic plan for Fujian's hydropower exploitation and plays an important compensatory and regulative role. Since the reservoirs cannot be built according to the original plans, the setting up of two power stations at Shuikou on the lower reaches of the Jianxi River will mean an annual reduction of 3 billion kilowatt-hours of electricity and some 600,000 kW of guaranteed power. The losses from the Qingtian and Jianxi stations have greatly affected the energy resources of the Fujian and Eastern China power grids.

From 1960 to 1965, hydropower construction in Eastern China was mainly for the purpose of filling in the blanks in addition to preparations for the resumption of a small number of projects. No new power generation center was built. During the Great Cultural Revolution, both design and construction were seriously disrupted. The cascade power station at Gutianxi was not completed until 1974, after 24 years of construction. Had it not been for the dispersal of forces, materials and funds in 1958, it is estimated that all four cascades could have been completed in 1964, and the construction period would have been shortened by 10 years.

A review of hydropower construction in Eastern China raises many thought-provoking questions. The following three points first come to mind:

1. Selection of the site is a fundamental task. Projects were carried out at Shangyoujiang, Gutian and Xinanjiang during the first 5-year plan after a comparison of alternate plans for the development of the river basins and the selection of the best. All these sites were easy to develop. Therefore, we had a clear idea of the task to be performed, the people to enjoy the benefits of power supply, and the great economic advantages. After completion, these stations became the backbone power sources of these localities and proved to be good investments. In the second half of 1958, projects were started hastily without selection of sites according to the river basin plans or a comparison of alternate regional plans. Therefore, they left behind many problems. The problems would be even greater and the adverse effects more serious if large-scale engineering projects had been started hastily. A glance at these conditions will show that a planned selection of sites, including a comparison of many alternate river basin plans and regional plans, is a strategic action in hydropower construction which should be highly regarded.

2. Survey, design and construction must be carried out well and the timely supply of construction funds and materials must be assured. These are mandatory for the construction of hydropower stations with greater, faster, better and more economical results. In the course of construction for the one-level two-stage projects at Shangyoujiang and Gutian, and the project at Xinanjiang, both design and construction were conscientiously carried out with a high regard for work quality. As soon as these projects were determined upon, both investment and material supplies were assured. Thus the general work progress was ahead of schedule. For instance, preparations for the Xinanjiang project began in the second half of 1956; the main project began in April 1957; and by April 1960, the first set of equipment was able to generate power. The whole project took only 3 and 1/2 years. Again, the Shangyoujiang project was started in 1955 and power was generated by 1957. The whole project took less than 3 years. Construction of the one-level two-stage project at Gutian began in July 1957, and power was generated by October 1959. The whole project took slightly more than 2 years. From these instances we can see that as long as there is proper and meticulous preplanning and the assurance of funds and materials, the construction period of hydropower stations can be shortened. The "beard-growing" projects which occurred later were mostly attributable to crude survey and designs--which account for the difficulty in working out a construction plan--poor work quality and the unreliable supply of funds and materials. The interference and sabotage by Lin Biao and the "gang of four" further prolonged the construction period.

3. It is very important that strong support for hydropower development can be counted on from various quarters, because the building of large hydropower stations involves a wide range of problems. When several projects were carried out during the first 5-year plan, the localities adopted an attitude of mutual concern and active support in such matters as assignment of cadres, supply of materials, allocation of manpower, relocation of people in the reservoir areas, and coordination of transportation and forestry. As a result, the construction proceeded smoothly. Now, very high demands are being made on the hydropower construction departments in matters of relocation of people, transportation, forestry and posts and telecommunications. These demands have added to the burdens of investment and workload for hydropower projects and reflect a change from the former attitude of

mutual concern for the development of hydropower. To facilitate hydropower construction hereafter, it is necessary to formulate rational policies as a satisfactory solution to these problems.

II.

Eastern China's water resources are mainly concentrated in Fujian, Zhejiang, Jiangxi and Anhui. Many water resources in Anhui and northern Zhejiang have been developed, and the main efforts should be directed toward the exploitation of those in southern Zhejiang, Fujian and Jiangxi. The Ministry of Electric Power Industry has defined that region as one of our national hydropower bases which are of great significance in promoting hydropower construction in Eastern China.

There are two very distinctive cnnstruction tasks for the development of the Fujian-Zhejiang-Jiangxi hydropower base: First, we should increase the capacity of the existing Eastern China power grid for peak adjustment, frequency modulation and standby purposes, and reduce the consumption of crude oil and coal in order to create conditions for a better power supply from these power grids, a more economical operating water level, and an expansion of the power grids to integrate with those in Fujian. Second, we should accelerate the economic development of the regions concerned through the supply of local electricity. We have to rely mainly on the efforts of various provinces in setting up small and medium-size hydropower stations to bring about such development.

To increase the capacity of the existing Eastern China power grid for peak adjustment and frequency modulation, we should hereafter actively carry out the construction of large and medium-size hydropower stations in the river basins of Oujiang and Feiyunjiang in southern Zhejiang, and the Minjiang River basin in Fujian. According to data from existing plans, there are five cascades in the Oujiang River basin totaling 1.06 million kW, with an average annual power generation of 220,000 kW, which can be gradually developed. It is anticipated that by 1990, we will require a peak adjustment capacity of approximately 4.5 million kW. After deducting the peak adjustment capacity of the thermopower stations now in existence, we still need an increase of 2.5 million kW of peak adjustment capacity, and reliance on the development of hydropower in southern Zhejiang alone is not enough. Therefore, we must take early action to develop the hydropower of northern Fujian. The Shuikou power plant on the trunk of the Minjiang River is an ideal one for further development. This station will be the largest hydropower station in Eastern China. It enjoys good geological conditions for construction, and seasonal adjustments can be carried out on the reservoirs. At a 95-percent guaranteed utilization rate, it will have a capacity of 260,000 kW, and after the completion of reservoirs along the tributaries, the capacity can be further raised to above 300,000 kW, with a final installed capacity of 1.4 million kW. The average annual power generation will remain at 4.95 billion units for many years. When the Shuikou Power Station is linked up with the hydropower stations of Xinanjiang and Fuchunjiang and compensatory adjustments are made, full play can be given to the regulative role of the Xinanjiang Reservoir, and even in dry seasons the capacity of the Xinanjiang Hydropower Station can be raised to more than 50,000 kW. This will create favorable conditions for increasing the installed capacity and the frequency modulation and peak adjustment capacities. The Shuikou Power Station will also be a junction station when the Eastern China power grid moves southward to join up with that of Fujian, and through the power transmission lines from the Shuikou station to the Eastern China power grid, the vast hydropower resources of Fujian can be better utilized. Besides Shuikou, there are still 10 billion units of power energy in the Minjiang River basin to be exploited and utilized. Among them are the power stations at Shaxikou and Jiemian, and their construction within the next decade can be considered.

Fujian is quite poor in coal and petroleum, but rich in water resources. We should take advantage of this strongpoint by developing hydropower, working out long-range plans for hydropower construction and by carefully planning the capital construction procedures for various types (runoff, regulation) of power stations so that the problem of load used can be solved by basically relying on hydropower stations. The Mianhuatan Hydropower Station in southwestern Fujian should be developed early as the backbone power source of the south in Fujian's unified provincial power grid. There are also many cascade power stations along the Muyangxi River and the Huotongxi River in eastern Fujian and along the Jinxi River, the Shaxi River, the Dazhangxi River and the Jianxi River in northern Fujian which can be gradually developed and utilized.

Jiangxi Province is fairly rich in water resources, and hydropower development should be encouraged there. First, we should build the Wanan Hydropower Station, and then we should plan for the construction of a number of medium-size power stations, such as the Guting Hydropower Station on the upper reaches of the Shangyoujiang River. The Xiashan Hydropower Station in the Ganjiang River basin is a key project in the development of this river basin with great advantages in power generation and flood prevention. However, a lot of land will be inundated and many people will have to be relocated. Therefore, plans should be worked out early.

Based on the requirements of the Eastern China power grid and the power requirements of Fujian, Zhejiang and Jiangxi, plans for the construction of hydropower bases in these three provinces for the next 10 years are now being worked out for the Eastern China Power Administration Bureau and the power bureaus of these provinces. The Eastern China Survey and Design Academy intends to build 13-15 power stations in 10 years with a total capacity of 4.2-4.6 million kW and an annual power generation of 14-15 billion kilowatt-hours. Five of these stations will be set up in southern Zhejiang and four will be in Fujian, where it has been proposed that the Jiemian Hydropower Station designed by the provincial design academy will soon be included in the capital construction plan. There will be three stations in Jiangxi, where the Wanan station is now being designed by the Changjiang staff office. In addition, two other stations, the Huangtankou and Hunanzhen stations, can still be expanded in order to increase the peak adjustment and standby capacities of the Eastern China power grid.

Apart from its hydropower resources from rivers, Eastern China is also rich in tidal energy. In Zhejiang, Fujian and Jiangsu Provinces alone, there is a potential for 230 billion units along the coast. Zhejiang has already set up the Jiangxia Tidal Energy Experiment Power Station with an installed capacity of 3,000 kW, and the first generating unit with a capacity of 500 kW has been in formal operation since last May.

Despite the problems of heavy investments in construction, large amounts of materials required for the generating units, corrosion from sea water and silt, and complexity of construction, tidal power stations have the advantage of regenerative energy and require very little inundated land and relocation of people. They also provide facilities for sea water breeding, extraction of precious metals (including uranium) and many economic advantages for comprehensive utilization. Tidal energy can also be fully utilized in the joint operation of large hydropower and thermopower stations in large power grids. Therefore, in developing future tidal energy resources in Zhejiang and Fujiang, it is proposed that the Jiangxia Tidal Power Station be used as a base for scientific experiment, and that we should also proceed with the planned selection of sites, the experiment of generating unit designs, the prevention of corrosion by sea water and microorganisms, research in the laws of silting, study of the methods of design for building structures in deep water bays, and so forth. It is also proposed that scientific research on tidal energy be included in the program of energy scientific experiments and that the state should annually allocate funds for this purpose. If necessary, special organizations should be set up and charged with responsibility for organizing and coordinating this work with other related scientific experiments.

The coal and water resources in Eastern China, in our opinion, are quite inadequate for future power consumption. By the year 2000, it is likely that nuclear power stations will be vigorously developed, while thermopower factories will make use of high-efficiency equipment with high single-unit capacity to meet the future growing demands. Based on the available load of the Eastern China power grid and the distribution of energy resources, we can see that the load will be concentrated in Shanghai, southern Jiangsu, northern Zhejiang, Nanjing, Wuhu and the narrow strip of land along the banks of the Changjiang River; while coal resources are in Huainan, Huaipei, northern Jiangsu and southern Shandong; and water resources are in Zhejiang and northern Fujian. These resources are all too far away for power transmission to the area of load concentration. To take better advantage of the nuclear power stations and high-capacity generating units, we should, as we have observed from international experience, build water-pumping and energy storage stations in southern Jiangsu, southern Anhui, northern Zhejiang and other areas that are close to the area of load concentration, in order to solve the problems of peak adjustment and absorption of residue electric energy late at night. According to planning, surveying and research in recent years, there are a number of water-pumping and energy storage power stations which can be developed, such as Xiangshuijian and Xixingchong in southern Anhui. It is proposed that planning and research be started at locations suitable for water-pumping and energy-storage stations, and then two or three feasibility reports be drawn up for further preliminary design in an attempt to build a water-pumping and energy-storage power station of about 300,000 kW during the seventh 5-year plan. This will reduce the difficulties resulting from overloading, improve the working conditions of hundreds of thousands of workers, and pave the way for building large energy-storage power stations in the future.

III.

In hydropower construction, Eastern China still faces several problems which must be resolved.

1. The question of strengthening and formulating long-range plans: Based on the special characteristics of Eastern China, such as its scattered hydropower resources and the large number of small and medium-size stations, we must follow the state's long-range plans and energy policies in order to avoid the indiscriminate addition of projects. Through comprehensive study of the characteristics of power load and the methods of developing river basins as well as the plans of regional economic development, we should work out long-range plans for hydropower construction and determine the sites for development and their order of priority as the basis for surveying, designing and annual planning. There should be no gaps left between surveying and designing, or between designing and construction, so that our limited forces and funds can be used to the best advantage and the waste of time and resources avoided. Hydropower construction plans already determined should be relayed by the central authorities or the provinces to various counties and communes in the appropriate manner. Capital construction projects should be prohibited below the backwater line of reservoirs so as to avoid losses from extended inundation.

2. The question of reforming the present capital construction procedures and the readjustment of planning stages: According to the present regulations on capital construction procedures and methods of administration, preparations for construction can be carried out only when the preliminary design has been approved. Preliminary design involves a very great deal of work, and it takes 2-4 years to prepare one that is only barely acceptable for a large or medium-size hydropower station. However, if the advanced planning and site selection work before the preliminary design are insufficient and superficial, if there has not been in-depth study on the question of suitability of sites, and if no investigation has been conducted at either the central or the provincial levels on the choice of sites after a comprehensive comparison, then nobody can have any idea as to how to use the investments for maximum economic results. Sometimes, there may be a lot of redtape in connection with certain projects that is not urgently needed at all, causing waste of precious time and energy. Again, there is the usual practice of setting timelimits for the submission of preliminary design documents in order that the project can be included in the annual capital construction plan at an early stage "in accordance with" capital construction procedures. However, if important technical problems in the design have not been thoroughly studied, revisions are inevitable even after approval. In such an event, important technical changes have to be made after construction has already been started. To speed up and improve hydropower construction, it is proposed that the capital construction procedures be reformed and that readjustments be made to the work during the designing stage. Our initial idea is that more intensive planning should be carried out at the stage of site or dam selection so that part of the work specified in the preliminary design could be done at this stage. Then, on the basis of this planning, a job description could be compiled for the project. An approved job description would serve as the basis for construction preparations, financial allocations and the "construction design." Another part of the work specified in

the preliminary design together with the first part of the work specified in the technical design should be included in the construction design, and the approved "construction design report" would be the basis for compiling the construction blueprint, which then could not be changed any further. The main portion of the engineering construction could not be started without this "construction design report."

3. The question of apportionment of investments in projects for comprehensive utilization: In building hydropower stations, rational consideration should be given to comprehensive utilization for navigation, timber production, water supply, irrigation and flood prevention. This was basically the rule for building hydropower stations before. In the future, if the investments required for all these items (including long-range development) were to be borne exclusively by the hydropower construction units, then the burden of capital construction investments for the electric power industry would inevitably be increased and the construction would be slowed down or reduced in scope. Therefore, we suggest that: 1) the former joint notice from the four ministries and the documents issued jointly by the former Ministry of Hydropower Industry and the Ministry of Forestry be reconsidered, and rational and practical measures should be worked out; 2) investments should be apportioned; if they must be exclusively borne by the Ministry of Electric Power Industry, then the State Planning Commission should be asked to transfer to the Ministry of Electric Power Industry the funds originally earmarked for the departments concerned. The detailed methods could be studied and determined according to specific conditions.

4. The question of funds for relocation of people and removal of homes in reservoir inundated areas is very complex in hydropower construction in Eastern China. At present, heavy demands are being made on the issue of people's relocation, and the funds required for this purpose have nearly doubled. This is unfavorable to giving priority to the development of hydropower. In order to accelerate the exploitation and utilization of water resources and to rationally solve the problem of people's relocation in the inundated areas, it is suggested that the state should work out "reservoir laws" to be enforced after approval. All units and personnel concerned should realistically discuss and solve this problem in a joint effort to build hydropower stations in the interest of energy conservation for future generations and to contribute to the four modernizations.

In conclusion, we should say that there is a great future for hydropower development in Eastern China. It is hoped that this construction will be supported strongly by various quarters so that the water resources of Eastern China will be developed and utilized as a contribution to the four modernizations.

Hejiang River in Guangxi

Beijing SHUILI FADIAN [WATER POWER] in Chinese No 1, 12 Jan 81 pp 47-48

[Atricle by Huang Zhihua [7806 3112 5478] of the Hydropower Survey and Design Section of Wuzhou region, Guangxi: "An Example of Harnessing Small and Medium-Size Rivers in Cascades--Tentative Idea of Harnessing Hydropower Potential of Hejiang River"]

[Text] The Hejiang River is one of four large rivers in the Wuzhou region of Guangxi. It is 186 km long inside the region, with a natural drop of 146 meters, and controls a valley area of 7,030 square kilometers. The average flow for many years has been 240 cubic meters per second. Its greater tributaries are the Linjiang, the Maweihe and the Paishahe. It also has 44 small tributaries, and is very rich in water resources. According to preliminary statistics, the total water energy potential in the entire valley is 242,000 kW. At present, the installed capacity of the small hydropower stations already built totals nearly 100,000 kW. For many years, the average annual rainfall in tee valley has been 1,670 mm. There are 5 hydrology stations and 17 rainfall stations and weather stations which have been carrying out on-the-spot observations for more than 22 years, supplying valuable hydrologic data for the development of the Hejiang's cascades.

The main course of the Hejiang is a combination of two river courses--the Fujiang and the Hejiang. The Guishi Power Station on the first cascade of the Fujiang River was built at the end of the 1950's and the beginning of the 1960's, and was completed and commissioned in 1963. The total capacity of the reservoir is 178 million cubic meters, with an installed capacity of 12,000 kW. To further utilize the power station's tailwater for power generation and irrigation, all the counties and communes in the lower reaches have taken advantage of the gentle slope of the riverbed, the flat land surface on both banks, the concentration of urban and rural populations and the centralized farmland, and, in accordance with the principle of less inundation and no removal of homes, built cascades at Chengxiang, Jiangjia, Yangtou, Huangshi, Fanglin, Xiadao and Longjiang. Besides giving the Hejiang the features of "one-level regulation and multiple-level utilization," these people have accumulated a great deal of experience in water resource exploitation. Construction of the main power station of the Hejiang cascades--the Hemianshi Power Station with a total reservoir capacity of 235 million cubic meters, an installed capacity of 68,000 kW, and a designed irrigation area of 103,500 square mu--began in the early 1970's. After its completion, there will be a unified power grid embracing Fuchuan, Zhongshan, Hexian, Cangwu and Wuzhou. This will not only greatly improve the power situation in Wuzhou region, but will also reduce the heavy burden of transporting coal from the north to the south. According to preliminary statistics, the two thermopower plants in Xiwan and Wuzhou alone can annually help the state save more than 200,000 tons of coal and more than 3 million yuan in transportation expenses. The entire investment can be recovered 3 years after the power station goes into operation.

For a rational layout and the planned and designed exploitation of the water resources of the Hejiang, we have made certain changes to some aspects of the cascades considered to be a little irrational when we planned and designed for the small and medium-size rivers in 1978. In the disjoined portions of the cascades from Guishi down to the Hemianshi Reservoir, we built the Longjing, Lengshuichang, Dajiangzhai and Gongdong cascades according to the standard course of a canal. As to water transportation, we planned to extend the navigation route to Zhongshan.

We also carried out planning on the tributaries of the Hejiang. Since the upper reaches are mountainous, the middle reaches are broad and there are gorges in the lower reaches, and because of relatively less inundation which would require the removal of homes, on the lower reaches it would be easy to build high dams and large and medium-size reservoirs, and to improve the power stations for irrigation, power generation, flood prevention and regulation. These measures are of great, practical significance in making full use of the existing equipment in the Hemianshi Power Station. Therefore, on the tributaries, we have planned and designed the building of reservoirs in Xiangshi, Matao, Nantang and Liuyang with a total capacity of 481 million cubic meters. After the completion of the construction, it is estimated that the power stations on the lower reaches can be regulated each year to increase the amount of electricity by 331 million kilowatt hours, which is equivalent to the capacity of a newly built Hemianshi Power Station. On the 37 km course from the lower reaches of the Hemianshi to Fulong, we have planned for three cascades at Xindu, Shijue and Fulong with a total installed capacity of 26,000 kW. After the completion of these cascades, and because of Guishi on the upper reaches, Hemianshi and the newly built reservoirs with a capacity of more than 1 billion cubic meters for flood prevention and regulation will become a power station with the highest utilization rate in Wuzhou region, and the navigation along the trunk of the Hejiang will be free from any obstacle.

Management of Small Stations

Guangzhou NANFANG RIBAO in Chinese 15 Jun 81 p 1

[Article by Weng Zuoxiang [5040 0155 4382], Luo Jianshan [5012 1696 1472] and Bai Shanhua [4101 0810 5478]: "Management of Small Hydropower Stations Strengthened for Improved Economic Efficiency"]

[Text] A national symposium on improving the economic efficiency of small hydropower stations was held in Yangshan County, Guangdon Province, from 1 to 9 June. Engineers and technical personnel engaged in small hydropower research from 25 provinces, municipalities and autonomous regions, experts and scholars of universities and research institutes, and administrative comrades of relevant departments, a total of 140 people, attended the conference.

During the conference, representatives heard reports on experience in strengthened scientific management and improved economy of small hydropower stations in Yangshan County and other places in China. Penetrating studies were conducted on a number of special topics on improving the economic efficiency of small hydropower stations; 44 technical papers were presented and exchanged. The consensus of the discussion was that small hydropower stations have made great progress in China since the revolution, and especially in the past few years. Up to the end of last year, 88,000 small hydropower stations had been built in China, with a total machine capacity of 6.93 million kilowatts and an annual generation of 12.7 billion kilowatt-hours. Among the 2,000 counties (banners), 1,478 have now small hydropower stations. This is a substantial force in China's energy construction and is an important supplement to the major electrical networks.

It was also pointed out that China has numerous small and medium rivers which provide a bright future for small hydropower stations. Not many of these water resources have been developed, and even among the ones with small hydropower stations, some have not yet fully developed their potential. Participants at the conference made a number of suggestions; they expressed the belief that in the period of national economic readjustment, the most important task is to shift the emphasis at small hydropower stations to readjustment and stepped-up management. The attitude of construction first and management second must be overcome, and scientific management, readjustment, systematization, and development of potential must be carried out seriously at existing small hydropower stations. Electrical loads should be actively developed and annual utilization hours improved so that the efficiency of existing facilities can be fully developed.

The symposium was jointly sponsored by the specialty committee on rural electricity of the China Electrical Engineering Association and the Bureau of Agriculture and Water Conservation of the Ministry of Water Conservancy and Electric Power.

GROWTH OF ELECTRIC POWER INDUSTRY DISCUSSED

Hong Kong CHING-CHI TAO-PAO [ECONOMIC REPORTER] in Chinese No 19, May 1981
pp 8-9

[Article by Zhong Ping [0112 1627]: "Development of the Chinese Electric Power Industry in 1980"]

[Text] In 1980 the Chinese electric power industry completed all the national plans above norm. A total of 300 billion kilowatt-hours of electricity, which represents a 6.4-percent growth and is 10 billion kilowatt-hours more than originally planned, were produced, insuring that the electrical demand of an 8.4-percent growth in industry were met. Generators with 2.48 million kilowatts of capacity were installed, making the national total generator capacity 60.25 million kilowatts; 5,532 kilometers of transmission lines of 110 kilovolts or higher were completed, which exceeded the planned level by 36 percent; and major technical and economic indicators such as coal consumption and equipment operation also reached or exceeded the best level in history. The nation's agriculture, light textile industry and people in cities and towns were basically guaranteed an electricity supply and the quality of the electricity was also noticeably improved. But due to the excessive deficit of the past, the problem of a severe imbalance between the electric power and the national economy has not been completely resolved. The problems of unbalanced generation, transmission and transformation of electricity within the electric power industry have not been completely solved either. Although the shortage situation of some inland electric power networks has been temporarily improved, electric power is still in short supply for major networks of coastal industrial bases in northeast China, the Beijing-Tianjin-Tangshan area, and eastern China, and for some provincial networks as well.

In 1981, the electric power industry is continuing to move forward on the basis of the 2 years of readjustment and is striving to do well in making internal adjustments, generate more electricity, provide better electric service and make a greater contribution to the national economic readjustment. The electric power industry mainly needs to do well in the following 10 areas:

1. Make good use of limited capital construction investment for optimum effect.

With capital construction investments greatly reduced in 1981, the electric power industry still remains a high priority in China, with an investment equal to

9.1 percent of the total national investment, an increase of 2 percent from 1980. Within the Ministry of Electric Power Industry, the investment direction continues to adjust the proportion of generation and delivery of electricity, to increase the investment in the transmission and transformation of electricity, and to strengthen the weak links in this area. In 1979 the investment in the transmission and transformation of electric power increased from 13.2 percent to 17.2 percent of the total investment of the entire electric power industry; it further increased to 22.3 percent in 1980, and this year it is continuing to increase to 28.1 percent. The investment in hydroelectric power is rising from 48 percent of the industry total investment in 1980 to 50 percent in 1981, and thus is creating favorable conditions for major developments in hydroelectric power. In order to get the maximum impact, the capital construction investments are mainly concentrated on priority engineering projects, including the Gezhou Dam project, projects to bring a dozen hydroelectric and thermoelectric power stations on line, major power transmission and transformation projects, and preconstruction preparations. Seven new construction projects are also being added in 1981.

2. Strive to complete the 305 billion kilowatt-hours electricity generation plan above normal and raise the quality, production safety and equipment operation to new levels.

According to the national economic development plan for 1981, electricity generation is set at 305 billion kilowatt-hours, out of which 50 billion kilowatt-hours are hydroelectric. This goal has room for improvement; if the fuel supply is more abundant than planned and the water situation is better than expected, the generation of additional electric power is possible. The quality of the electric power, safety in production, and equipment operating condition will also be raised to a new level in 1981. In the area of quality improvement, the current task is to simultaneously improve the frequency specification and solve the problem of electric voltage not up to specification. The proportion of class I generation facilities will be gradually increased from 41 percent to over 50 percent.

3. Concentrate on priority engineering programs under construction and final-stage projects.

First, grasp well the ongoing major hydroelectric construction projects at Gezhou Dam, Longyang Canyon, Dong River, and Dahua, and complete the coffer dam construction to insure safety during this year's flooding season. Second, bring 1.8 million kilowatts of machine systems into operation in 1981. Although there is a decrease in the installation of production equipment this year, the machine systems to be installed for production are all large-capacity machines with an average capacity of 120,000 kilowatts, which is twice the average capacity per machine in 1980. Third, accelerate the design, construction and operation of the 500,000-volt ultrahigh-voltage engineering projects, including the completion of 610 kilometers of 500,000-volt ultrahigh-voltage transmission line from Ping Ding Mountain in Henan Province to Wuhan in Hubei Province. The 500,000-volt high-voltage line from Yuanbao Mountain in Inner Mongolia Autonomous Region to Liaoyang municipality in Liaoning Province should be built quickly, and the 120-kilometer transmission line from Jinzhou to Liaoyang in Liaoning Province will also be completed in 1981. In the meantime, large hydroelectric power stations and large power plant delivery networks at Gezhou Dam, Wujiangdu, Shentou, Fu-la-er-ji and Huai Bei should be undertaken. Fourth, undertake well the 24 final-stage projects (9 hydroelectric and 15 thermoelectric). Among these construction projects, wherever the main machine has come on-line for generating electricity, but the public utility system, the hydraulic engineering construction and the transmission lines are unfinished, efforts should be made to push for completion in 1981.

4. Contrive to conserve energy.

Energy conservation is a key mission in the period of national economic readjustment. Conservation is particularly important in the electric power industry. In 1980 each kilowatt-hour of electricity consumed 448 grams of coal, 9 grams less than in 1979, and saved 2.92 million tons of crude coal. In 1980 China suffered from floods in the south and drought in the north; the combined water volume of large- and medium-scale hydroelectric facilities of the nation was only 2 billion cubic meters more than that of 1979. However, by insisting on the rational use of hydraulic resources, the amount of electric power generated was 10.4 billion kilowatt-hours more than planned, which was equivalent to a saving of some 6.2 million tons of crude coal.

We need to decrease the consumption of coal, electricity and oil to a new low in 1981. The goal of national average coal consumption for supplying 1 kilowatt-hour of electricity is set at 444 grams, 4 grams lower than last year, and the line loss is set at 8.9 percent. The conversion of oil-burning machines to coal-burning machines should be continued in order to reduce the oil consumption. Concurrent with the efforts for energy conservation in the electric power industry itself, efforts should also be made to coordinate among various regions to strengthen the management of electricity consumption in order to carry out the policies of national economic readjustment. In arranging the distribution of electric power, priority should be given to agriculture, light and textile industries, energy resource industry, construction material industry, communication and transportation, and industries that serve the export business and people's livelihood. Electricity supply should be limited at those enterprises that consume large quantities of energy and produce inappropriate products. Reform proposals for the price of electricity should also be investigated in order to promote electricity conservation and the rational use of electricity.

5. Preparatory work of capital construction should be greatly strengthened.

One of the vitally important tasks in readjusting the electric power industry is to turn around the phenomenon of disorder in the preparatory work and the engineering projects under construction. The 1981 plan calls for the completion of preliminary designs to provide 6.67 million kilowatts, the execution of 14 river projects, the completion of plant-site selection and plant-site planning for 10 million kilowatts each, and the long-term planning for major networks. The various design institutes should strive to move the schedule forward, and now is the time to make proposals for the post-readjustment seventh 5-year plan and the early-stage work necessary for future development. In order to do a good job in hydroelectric planning and construction, the construction work of the three hydroelectric design institutes in eastern, south central and northwest China are being accelerated.

6. Continue to reform the network management system and broaden the test point work for enterprise autonomy.

Electric power networks in China are being placed under the concentrated and uniform management of the electricity management bureaus in the six large regions. This is different from the provincial and regional management system of the past. In doing so, a proper balance can be maintained in the generation, supply and sales of electricity; the integral nature can be maintained in the network's generation and distribution; and the maximum economic efforts can be insured. In the past year or so, progress has been made in moving toward a centralized and unified management of electric power networks. In addition to the existing electricity management bureaus in northeast and eastern China, bureaus in northern, northwest and central China have subsequently been established and a southwest bureau is also being planned and organized. Test point work on the autonomy of the enterprise and the power network will be continued in 1981, and reform will be carried out through consolidation of the national economic readjustment experience.

7. Grasp well across-the-board quality control and further improve the engineering quality.

A system of rules, regulations and codes should be established this year. Quality management and control of each engineering procedure, from construction to production and delivery, and the inspection of design, raw material and equipment that affect the engineering quality should all be strengthened.

8. Find satisfactory solutions for the problem of insufficient business for construction and building units and enterprises.

Because of the reduced capital construction program, some construction units and building enterprises do not have enough business this year. How should we solve this problem? First, we should carry out training programs for workers in these units and organize a part of the technical personnel to carry out research and develop new products urgently needed in the electric power industry. In the meantime, we should coordinate contracting or partially contracting jobs such as overhaul of power plant generators and boilers, construction of agriculture electricity supply, local housing construction, external system machine installation, machining of structures, machine maintenance and technical support. On the basis of current economic aid engineering projects to foreign countries, we should actively organize product export, contract foreign construction projects, and collaborate with foreign manufacturers in producing machinery and electrical products.

9. Strengthen scientific and technological research and work toward breakthroughs in some vital scientific research areas.

In the meantime, we must promote scientific and technological achievements so that science and technology can transform the production force as quickly as possible. Key technologies in electric power production construction and in conservation and production increase should be combined. Technical innovation and technical and scientific exchange with foreign nations should be broadly promoted to further exploit the use of a technical information network, scientific and technical exchange and the publicizing of results in science and technology. Channels for exchanging scientific and technological information and data should be systematically broadened.

10. Strengthen the training of all staff members and workers in order to elevate the professional technical level.

During the current period of national economic readjustment, we should grasp the opportunities for worker and cadre training; this is an imperative strategy for the realization of the four modernizations. The method should be a combination of on-the-job training and rotational on-leave training. Special attention should be paid to the systematic organization of short-term rotational on-leave training. For the workers, emphasis should be on young workers 35 years or younger and key production workers at major posts. Efforts should be made to complete one round of rotational on-leave training in the 1981-85 period. For those leading cadres not familiar with the business operation, classes in production knowledge, business and technology should be provided for them. For those management cadres not familiar with the production procedure, basic courses in production should be given. In the meantime, technical knowledge reviews should be organized for upper and middle-level engineering and technical personnel so that they can acquire knowledge of new foreign technical theory and technologies not available in China.

PROGRESS IN METHANE GAS RESEARCH DESCRIBED AS ENCOURAGING

National Methane Gas Conference

Beijing GUANGMING RIBAO in Chinese 18 Jun 81 p 2

[Article by reporter Song Guangming [1345 0342 2494]: "Methane Gas Research in China Shows Encouraging Progress"]

[Text] The reporter learned from the National Methane Gas Work Conference recently held in Beijing that methane research in China has progressed rapidly in recent years, some research achievements have taken effect, and the technical team of rural methane gas specialists has grown to 100,000.

In the past few years, methane gas development in China has made great progress. To date, 23 provinces, municipalities and autonomous regions have established and perfected methane gas management organizations and 700 million methane tanks have been constructed in China. Of the 700 million methane tanks, 143 million were new constructions after 1979 and the success rate has been better than 95 percent. Scientific research in methane gas has also increased markedly and some provinces, municipalities, counties, colleges and universities and scientific research units have set up methane gas research organizations and achieved some results. For example, scientific and technical personnel of the National Methane Research Tank-Building Coordination Group investigated various types of methane gas tanks in 20 provinces, municipalities and autonomous regions and has finished compiling a tentative edition of the "Selected Standard Models of Rural and Household Methane Gas Tanks." The newly selected hydraulic-type circular and spherical tanks are simple in structure, easy to manufacture, high in adaptability, low in cost, and provide satisfactory solutions for the interdependence between fertilizer and gas and between applicability and locality. Other achievements in research and development include the successful development of the anaerobic digestion contact technique, which has achieved a high standard; the generation of methane gas from sewage and sludge from leather plants and pharmaceutical plants; the first separation of pure methane, which filled a void in the field of methane research in China; and the successful development of electric generators running on gasoline-methane mixture and on pure methane gas. Application of these research achievements will further promote the development of methane production. The technique of methane production from plants' "three pollutants" using anaerobic fermentation is not only beneficial for environmental protection but also provides a cheap source of energy. At the Rongxian County winery in Sichuan Province, the liquid brewhouse was generating 120 tons of refuse every day and seriously polluting the environment. For this reason the winery was ordered to stop production for 8 months and suffered a loss of 1.3 million yuan in production value. In 1978, methane gas tanks were built to produce gas from the refuse using the anaerobic fermentation technique and a methane power station was built as well. In 1980 the winery generated 580,000 cubic meters of gas at a value of 35,000 yuan and generated 216,000 kilowatt-hours of electricity, which saved more than 7,000 yuan for the winery.

It was proposed at the conference that methane research be strengthened by stepping up the manpower, material and funding support. The erroneous belief held by some people that methane gas has reached the promotion stage and that there is no further need for scientific research and the prejudice against methane fertilizer should be corrected. The conference also discussed and approved relevant documents, including "Selected Standard Models of Rural and Household Methane Gas Tanks" and "Regulations Regarding the Rural Methane Gas Worker".

Methane Gas From Sludge

Shanghai WEN HUI BAO in Chinese 23 Apr 81 p 1

[Text] Shanghai has succeeded in producing methane gas by fermenting sludge from leather plants. All the experts participating in an evaluation held 2 days ago believe that this achievement has provided a new avenue in the development of energy resources, the control of the three pollutants and the development of leather production. The leather goods plants in Shanghai generate great amounts of waste water and sludge in the production process and cause serious pollution to the city environment. The sludge from the leather plants is especially hazardous because of its large volume, high concentration and complex composition. Since it cannot be discharged at will or used as fertilizer, it is even harder to process than waste water. The management of leather plant sludge has become an important issue in the development of light industry and the protection of the environment. In 1978, the Municipal Scientific Committee, the Environmental Protection Bureau and the Handicraft Industries Bureau assigned the key research mission on this issue to the Shanghai Institute of Leather Industry. In collaboration with the Shanghai Hongguang Leather Goods Plant and the Shanghai Microbiology Institute, and with the assistance of the Municipal Scientific and Technological Association, the Shanghai Internal Combustion Engine Institute and Tong Ji University, the Shanghai Institute of Leather Industry carried out a number of studies, made small and medium-scale tests and completed the assignment last October.

Two days ago, experts and researchers participating in the evaluation viewed the generation of methane gas from sludge and the generation of electricity from methane gas at the Hongguang Leather Goods Plant. It was explained that the two leather plants in Shanghai, Hingguang and Hongwei, discharge almost 100 tons of sludge a day; with this scientific achievement, 4,000 cubic meters of methane gas with a heat value of 5,500 kilocalories can be produced daily. More than 1 million kilowatt-hours of electricity can be produced every year. The effect is even greater when the methane gas produced is used as a fuel: it will allow a savings of 1.8 million cubic meters of coal gas each year.

Methane From Human Waste

Shanghai JIEFANG RIBAO in Chinese 24 Apr 81 p 2

[Article by Wu Youwei [0124 1635 1218]: "Methane Gas Production--Turning the Cities' Human Waste Into an Energy Resource"]

[Text] The idea of turning cities' human waste into an energy resource through methane gas production proposed by Zhou Shi-e [0719 1102 6166], chairman of the board of directors of the Nanjing Boiler Association, received wide response at the recent Second Congress of the Jiangsu Provincial Association of Science and Technology. As pointed out by scientists attending the meeting, the idea is simple and practical, costs little money and has practical significance for the cities' energy resources.

Each year large amounts of funds and manpower are spent on the transportation and treatment of cities' human waste, and it has long been one of the difficult problems of the city administration. It is possible to transform the waste into something valuable, to turn the human waste into energy resources? Zhou Shi-e thinks so. Zhou has engaged in teaching and research in thermal energy engineering for a long time. Chinese biological energy scientists have done extensive research in this area and have achieved results in the selection of fermentation culture and in the preparation of a rapid fermentation agent. The problems of optimum structure of the methane gas pool, constant temperature control and output automation can also be resolved under present conditions in China. The case of turning human waste into methane gas in Qingdao city is an example of a success story. At the National Work Conference on Energy Resources held in October 1980, Zhou Shi-e presented his proposal to develop city methane gas. Now he has concrete plans for his idea--the installation of 60 7-meter diameter spherical methane gas tanks in Nanjing. The tanks will be divided into 6 groups placed in the 6 wards of the city and managed by technical personnel. The methane gas produced will be used as a secondary gas source in solving the living requirements of thousands of households.

Zhou pointed out that the development of methane gas in cities is highly significant in conserving energy. Many large and medium-size cities in China have already been equipped with a coal gas supply, but at present the sole source of gas is coke furnace coal gas. This not only consumes a great amount of coal but also places a large burden on transportation. The development of methane gas as an energy resource using cities' human waste is one form of energy feedback. This closed-cycle feedback is a very powerful conservation measure and it can also reduce the energy imports. Take Nanjing city, for example. The human waste of the

1.8 million residents and the transient population can be used to produce 540,000 cubic meters of methane gas every day, equivalent to the heat released from 540 tons of coal. This converts to 190,000 tons of industrial coal a year and can meet the requirements of 800,000-900,000 residents. If only one-fourth of the human waste in Nanjing is used in producing methane gas, 40,000-50,000 tons of coal can be saved and 200,000 people can be supplied with gas. In addition, the waste water from meat processing plants, leather goods plants, and bone glue plants and the draff discharged from distilleries can also be used in methane gas production.

The development of methane gas in cities is also beneficial to the environment. Coal furnaces used by city residents are the major sources of air pollution under the 10-meter altitude level. According to test results, residential coal furnaces are the most serious polluters in Shanghai. Using methane gas will greatly reduce the cities' air and water pollution. After high-temperature fermentation, the human waste can be used as fertilizer on vegetable farms, and this process will also reduce the parasite recycle and decrease infectious disease.

SPEEDY FORMULATION OF NUCLEAR ENERGY POLICY URGED

Tianjin KEXUEXUE [SCIENOLOGY] in Chinese No 1, 1981 pp 45-46

[Article by Ji Xiaohong [4694 1321 1347], Zhang Shunjiang [1728 7311 3068], and Xiong Benhe [3574 2609 0735]: "A Study on the Decision for the Development of Our Nuclear Energy"]

[Excerpt] The energy question is one of the major problems facing the world today. One of the salient manifestations of the economic crisis in the capitalist world is the energy crisis. This is by no means accidental, as energy is the major material foundation for social and economic development and for improving the livelihood of the people. A country's gross energy consumption and its per capita energy consumption are important indexes to the state of that country's economy and the level of the people's livelihodd. With regard to China, the realization of the four modernizations program will require a vast amount of energy. Whether we can achieve the large-scale development, full supply, and rational use of various kinds of energy will seriously affect the speed of China's industrial and agricultural development, the improvement of the people's livelihood, and the success or failure of the four modernizations program.

Inasmuch as energy needs are increasing very rapidly while petroleum and coal deposits are finite, mankind today should keep the coming generations in mind and not burn up as fuel all the earth's oil and coal--these valuable raw materials for the chemical industry which were produced millions of years ago through solar photosynthesis. Many countries of the world began looking for new, alternative energy sources several decades ago. After 30 years of such efforts, among the various new energy sources being developed throughout the world today, the only one that can be used industrially within the next 30 years, that can be developed on a large scale, and that is safe and clean is nuclear energy. It can be predicted that in the next 50 years, or perhaps even sooner, nuclear energy will gradually supplant petroleum and coal and become the main source of energy.

Although China's energy resources are not inconsiderable, they are not over abundant when considered on a per capita basis, in view of the large population. Furthermore, the energy resources are very unevenly distributed, and with respect to those areas such as Eastern China, Southern China, and the Northeast, where industry is developed, the population is highly concentrated, which are fairly far from the coal and oil-producing regions and are lacking in hydroelectric resources, the energy supply problem is already fairly serious, so constructing nuclear power stations in these areas as quickly as possible is a very pressing issue. Furthermore, we have already achieved the basic conditions for developing nuclear power. In the past 20 years or so, in the course of studying nuclear weaponry, we have verified a certain number of uranium deposits and we have built a fairly sizable nuclear technology research system and a nuclear fuel industrial system. Considerable progress has been made in the manufacture of nuclear engineering equipment and in the nuclear materials industry. A contingent of people with a considerable amount of practical experience in nuclear research and nuclear engineering design has reached maturity, which means that the development of nuclear power on a large scale in China and building up our nuclear industrial system as quickly as possible is not only a matter of utmost necessity, but it is also entirely attainable. The most important issue at hand is the speedy formulation of a nationwide energy plan and the establishment of the position nuclear energy is to have among China's energy resources. In addition, we must undertake serious study and arrive at some decisions regarding how China will develop nuclear energy and formulate pertinent guidelines and policies.

FAR INFRARED TECHNOLOGY USED IN HEATING, DRYING

Beijing BEIJING RIBAO in Chinese 7 Apr 81 p 3

[Article by Dong Ping [2639 1627]: "Far Infrared Technology Performs in Energy Conservation"]

[Text] In recent years a new member emerged in the field of infrared technology--far infrared technology. It is a powerful tool for heating and drying and is a useful technology for conserving energy. Compared to conventional heating methods, the far infrared technique leads to high product quality and low operating cost, takes up one-third less ground area, saves 30 percent of the electricity and reduces drying time one-third to one-half. It requires simple equipment that can be modified easily and provides rapid effect.

It is well known that infrared radiation is electromagnetic waves with wavelengths longer than those of visible light. Infrared can be used in heating and drying because water molecules and molecules of most organic solvents absorb infrared radiation. Since far infrared has a much wider wave band than near infrared, it has a much higher probability of being absorbed by matter and is much more penetrating than near infrared. Therefore, the heating ability of far infrared is even better than near infrared. A far infrared radiator converts ordinary heat (such as heat produced by a resistive wire or steam heat) into far infrared radiation and irradiates the object directly. When an object absorbs far infrared radiation, the molecular vibration becomes more vigorous and the object's temperature increases. When the water molecules and organic solvent molecules in the object acquire sufficient energy and evaporate, the object is dried rapidly.

At present the surface temperature of most far infrared radiators in China is generally less than 600°C. If the temperature is too high, the radiated infrared will be near infrared instead of far infrared; some of the near infrared will become visible light and that portion of energy is simply wasted. It can be said that heating and drying with far infrared is a new technology that uses a minimum amount of energy to achieve optimum result.

In 1979, 800,000 kilowatts of far infrared equipment were used in China, and the electrical energy saved in Shanghai alone was 130 million kilowatt-hours. Today infrared is widely used in China for baking paint, fixing color in printing and dyeing, processing rubber, manufacturing plastics, dehydrating leather, food processing, instrumentation and dozens of other applications. As the development of far infrared technology progresses, there are more and more different varieties of far infrared radiators. Far infrared heating and drying technology will play an even greater role under the demands of energy conservation.

COOPERATION WITH JAPAN, FRANCE IN OIL EXPLORATION REPORTED

Successful Results

Hong Kong CHING-CHI TAO-PAO [ECONOMIC REPORTER] in Chinese No 20, 20 May 81 p 2

[Article: "Economic Prospects: Chinese-Foreign Cooperation in Developing Offshore Oil Has Bright Future"]

[Text] Victory messages relating to Sino-Japanese cooperation in the development of Bohai oil and Sino-French cooperation in the development of Nanhai oil were heard recently. Although the messages were short they were worth noting.

In May last year, Japanese and Chinese oil companies signed a contract to explore and develop oil in the southern and western sections of China's Bohai. Drilling of the first well was started on 13 December and finished on 7 March this year. This well is 3,334.5 meters deep, with oil- and gas-bearing strata more than 300 meters thick. According to an announcement concerning the results of the exploratory drilling issued jointly by the Marine Branch Company of the Chinese Oil Company and the Sino-Japanese Oil Development Company, the daily production of the well is estimated at 1,000 tons of crude oil, 600,000 cubic meters of natural gas, and 50 tons of coagulated oil. The crude oil is said to be of very high quality with low specific gravity and low sulfur content.

Also in May last year, the Nanhai Branch Company of the Chinese Oil Company and the Dahl Petroleum Company of France signed a contract for the exploration and development of Beibuwan oil in the Nanhai area. Drilling of the first well was started on 8 January this year and finished on 16 April. This well, which is 2,900 meters deep, was named "Wushi 16--No 1 Well" in early May. This well was a gusher. Tests carried out on part of the oil strata confirmed that the thickness of the oil strata as well as the pressure at the bottom of the well and other physical conditions are so favorable that nothing like this has been seen before.

Today, the eyes of the world are concentrated on energy resources. Therefore, discovery of these two gushers in China's Bohai and Nanhai cannot help but attract attention here as well as abroad, and many people have started making various estimates. A spokesman of the Sino-Japanese Oil Development Company said in Tokyo that the quality of the oil gushing from one of the experimental wells was similar in quality to the Arabian light oil produced by Saudi Arabia. The oil strata reaches a total of 105 meters. This financial juridical person of Japan, who cooperated with China in this engineering venture, further stated that the area under exploration could very possibly prove to be an oil field with a potential yield of 10 million tons of crude oil (or 69.3 million barrels) a year. Will these two areas where gushers have been found really develop into oil fields? How big will the oil fields be? How many more wells need to be drilled? At this point we can only guess. However, foreign specialists generally consider that they are both highly hopeful.

Chinese experts are also quite optimistic about the future of developing oil in Bohai and Nanhai. According to a report, Deputy Director Ye Longfei of the Oceanography of the South Sea Institute, Chinese Academy of Sciences, has stated: The Nanhai area is rich in resources. The oil reserves of the area are believed to be richer and more concentrated than those of Southeast Asian areas, including the Philippines, Borneo, Java, Indonesia, Thailand, and Vietnam.

China is a large country with rich natural resources. However, on account of weak technological strength and limited financial power, exploratory work is lagging behind, and a large quantity of oil is still buried underground which has not been discovered or exploited. In view of the situation concerning oil production and consumption in China in the past 2 years, an energy shortage problem will soon overtake China. Therefore, finding new oil fields has become one of the most urgent projects today. At present, in addition to increasing production of the existing oil fields, expanding the range of exploitation and drilling deeper into the oil-bearing strata, China is also aggressively pursuing exploration of oil on land as well as offshore by attracting foreign firms to carry out cooperative joint ventures. Within the guideline of independence and rebirth from one's own power, an open policy is to be implemented and economic cooperation with foreign countries is to be developed. This is the new Chinese policy which, of course, applies to the realm of oil exploration also. Successful drilling of the first wells in Bohai and Nanhai, respectively, through Sino-Japanese and Sino-French cooperation has painted a bright future for further offshore oil development.

High-Yield Oil, Gas Well

Guangzhou NANFANG RIBAO in Chinese 29 May 81 p 1

[Text] According to reports by NEW CHINA NEWS AGENCY reporter Huang Fengchu [7806 1144 0443], a high-yield oil and gas well drilled by a joint operation of China and a French petroleum company at North Bay in the South China Sea is the first prospecting well drilled in the North Bay area. From April 20 to May 26, oil tests were carried out for the six sections containing oil and gas. According to test results released jointly by the South Sea Branch of the China National Petroleum Corporation and the French Dahl Petroleum Company, two sections of the well are relatively rich in oil and gas. The second section has a daily crude oil yield of 320 tons and a daily natural gas yield of 59,000 cubic meters. The third section has a daily yield of 320 tons of crude and 70,000 cubic meters of natural gas. The crude is of high quality, with low specific gravity and low sulphur content. This finding provides additional proof that this sea area is rich in oil and natural gas.

FBIS FOREIGN BROADCAST INFORMATION SERVICE

NOTE

JPRS publications contain information primarily from foreign newspapers, periodicals and books, but also from news agency transmissions and broadcasts. Materials from foreign-language sources are translated; those from English-language sources are transcribed or reprinted, with the original phrasing and other characteristics retained.

Headlines, editorial reports, and material enclosed in brackets [] are supplied by JPRS. Processing indicators such as [Text] or [Excerpt] in the first line of each item, or following the last line of a brief, indicate how the original information was processed. Where no processing indicator is given, the information was summarized or extracted.

Unfamiliar names rendered phonetically or transliterated are enclosed in parentheses. Words or names preceded by a question mark and enclosed in parentheses were not clear in the original but have been supplied as appropriate in context. Other unattributed parenthetical notes within the body of an item originate with the source. Times within items are as given by source.

The contents of this publication in no way represent the policies, views or attitudes of the U.S. Government.

PROCUREMENT OF PUBLICATIONS

JPRS publications may be ordered from the National Technical Information Service, Springfield, Virginia 22161. In ordering, it is recommended that the JPRS number, title, date and author, if applicable, of publication be cited.

Current JPRS publications are announced in Government Reports Announcements issued semi-monthly by the National Technical Information Service, and are listed in the Monthly Catalog of U.S. Government Publications issued by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

Indexes to this report (by keyword, author, personal names, title and series) are available from Bell & Howell, Old Mansfield Road, Wooster, Ohio 44691.

Correspondence pertaining to matters other than procurement may be addressed to Joint Publications Research Service, 1000 North Glebe Road, Arlington, Virginia 22201.

'JINGJI YANJIU' ON ECONOMIC READJUSTMENT

HK061120 Beijing JINGJI YANJIU in Chinese No 6, 20 Jun 81 pp 9-17

[Article by Gui Shiyong [2710 0013 6978] attached to the Policy Research Office of the State Planning Commission and Zhou Shulian [0719 0647 5571] attached to the Industrial and Economic Research Institute of the Chinese Academy of Social Sciences: "On the Aims, Stages and Measures of Economic Readjustment"]

[Text] At present, the guideline of further readjustment of the national economy is being carried out actively throughout the country. This is a strategic change in our economic task, which concerns all fields of economic life and will be accompanied by a lot of new circumstances and problems. In solving all these, it is absolutely necessary to study how to set up appropriately the aims of readjustment, make sure what stages should be undergone to achieve these aims and work out the measures which are needed in different stages based on reality; and thus enable all jobs of readjustment to be carried on in close coordination, step by step and smoothly, while avoiding blindness and spontaneity which are likely to emerge.

Concerning the Aims of Readjustment

The aims of the current economic readjustment, for the near future, are to overcome the present economic difficulties and eliminate latent crises; fundamentally speaking, this involves changing the serious disproportion of the national economy which has gradually occurred in the last 20 years or more and, starting from the real circumstances in our country, set up step by step an economic structure which is fairly harmoniously proportioned, more effective in terms of economic gains, and will operate in a healthy cycle. The concrete characteristics of this kind of economic structure are as follows.

First, the proportionate relations between various sectors of the national economy, within different sectors, and between various links of social reproduction must mainly be well coordinated, and the industrial organizational structure must be comparatively reasonable. The economic structure which we have just mentioned mainly denotes the industrial structure; in other words, the qualitative connection and quantitative proportion between different industrial sectors under certain socioeconomic and production technological conditions. Only after comparatively appropriate relations have been established between various sectors can the two great divisions of social production be harmoniously developed and social reproduction be carried on smoothly. On the other hand, the economic structure also includes the industrial organizational structure, that is to say, specialized collaboration among industrial enterprises. The latter concerns technological progress and the raising of labor productivity, and thus is closely related to the industrial structure. Under the present conditions in our country, no rationalization of the industrial organizational structure means no rationalization of the industrial structure.

Second, different factors of social production, including manpower, capital and material resources, are utilized in a relatively reasonable way; under the direction of the principle of a reasonable layout, economic predominance in various areas has begun to operate more effectively. For this reason, we must not only correctly handle the relations between various sectors, but also rationally deal with the division of work and coordination among different areas, and make use of various natural resources and the technological and economic forces of different areas according to their particular circumstances.

Third, the development of productive construction and the improvement of the people's livelihood are closely linked together, and help each other forward. A rational economic structure must not only maintain a healthy cycle which enables different sectors of the national economy to be coordinated and help each other forward, but also ensures a relationship of mutual coordination and mutual promotion between different links of social reproduction such as production, distribution, circulation, consumption, and so forth. In the final analysis, the healthy cycle presents itself in the form of a healthy cycle from production to consumption, and vice versa. Undoubtedly we have various criteria to judge whether an economic structure is rational, and how rational it is; nevertheless, the most important one is whether it can produce the best effect with the existing manpower and material resources, and thus ensure for the people as much stable improvement as possible in material and cultural life, on the basis of the continued growth of the national income.

It should be pointed out that the rationalization of the industrial structure can never occur without the readjustment of the relations of production and the reform of the economic management system. The development of social productivity, the formation of the qualitative and quantitative relations between different sectors of the national economy, all of them have to be realized under certain relations of production. Therefore, it is impractical to isolate productivity from the relations of production. Past practice has shown that under the socialist system, the economic management system is the solidification of the relations of production which has the most important impact on the development of productivity and the shaping of the characteristics of the industrial structure. The industrial structure has remained irrational in our country for a long time. This is due not only to the influence of the "leftist" guiding ideology which has brought about a lot of mistakes in working out the strategy of economic development, but also to the economic management system in which various serious problems and shortcomings can be found. In short, the conformity of the relations of production with productivity is an indispensable prerequisite for setting up a rational industrial structure. Certainly we cannot simply take the rationalization of the relations of production and that of the economic system as a sign of the rationalization of the industrial structure. However, in judging whether an industrial structure is rational, we can never overlook the state of the relations of production and the economic system, we may even regard the healthy cycle which enables productivity and the relations of production to help each other as an indirect sign of the rationalization of the industrial structure. If we want to adjust the proportions of the economy to set up a rational industrial structure, we must readjust the relations of production and reform the economic system correspondingly. That is the very reason why we reiterate that we have to rely on readjustment for one thing and on reform for the other in opening a new path to develop the economy of our country.

Some people realize that modernization is a mark of the rationalization of the economic structure. In our opinion, such a view is not appropriate. The rationalization of the economic structure is a relative concept which may be suited to the different development levels of productivity. Under the socialist system, the realization of modernization will help the rationalization of the economic structure. However, we cannot consequently draw the conclusion that the rationalization of the economic structure can never be reached until modernization is accomplished. In fact, even if the modernization level is not so high, rationalization of the economic structure is still possible. In our country, the level of productivity was even lower than it is today during the period of "the first 5-year plan," but the economic structure was then comparatively rational because correct auditing principles had been adopted, and the plan was conformed fairly well with reality, and was well carried out. On the contrary, the accomplishment of modernization does not necessarily mean the rationalization of the economic structure. Although the economy has already been modernized in many capitalist countries, their economic structures still remain irrational or are even developing lopsidedly. Under the present conditions in our country, we can neither confuse the rationalization of the economic structure with the modernization of the national economy, nor separate them completely. It should be realized that the rationalization of the economic structure will serve as a great incentive to push ahead with the modernization cause. On the other hand, in the course of rationalizing the economic structure, we should eagerly, in accordance with needs and ability, adopt every advanced technique which helps to improve economic effect. We should particularly speed up modernization in the existing enterprises, and thereby push ahead with the modernization of the social economy step by step.

Some other people reckon that a rational economic structure is equivalent to a light structure. Such a view needs further deliberation. The light structure, which is mentioned in general as compared with a heavy structure, means accelerating the development of agriculture and light industry so as to make them account for a certain proportion in the national economy, say around 60 percent. Such a view emphases developing agriculture and light industry, and changing the present lopsided structure in which heavy industry predominates. Indeed they are completely correct on this point. However, it is inappropriate in many cases to take the fixed proportion that agriculture and light industry make up of the national economy as a criterion for the rationalization of the economic structure. The reason is that, at different economic levels, the relative proportions which agriculture and light industry account for the national economy may stand for very different absolute levels. The proportion of agriculture is actually very small in some economically developed countries, but the production of agricultural products is comparatively high. Therefore, a small proportion of agriculture does not necessarily mean that it cannot conform with the development of industry and meet the people's needs. Whereas in many economically underdeveloped countries, though the proportion of agriculture is very large, the supply of agricultural products cannot meet the demand. This proves from another approach that a large proportion of agriculture does not necessarily mean a rational economic structure. In the last 2 years, in our country, the proportion which the output value of light industry accounted for in the total output value of industry has been raised very fast, the proportion of agriculture and light industry in the national economy is probably approaching 60 percent. However, our country's economic structure still has a lot of serious problems which need to be solved through a readjustment over quite a long period of time. All these facts show that the fundamental problem does not lie in how large a proportion agriculture and light industry constitute, but in whether their relations with the national economy are harmonious and whether such relations conform with the needs arising from the growth of the national economy and the improvement of the people's livelihood.

Some other people believe that a rational economic structure should be a type of "unfolded" [Shu Zhan 5289 1455] economic structure. Comrades who advocate this view call the existing economic structure an "extruded" [Ji Ya 2357 1090] type, based on the fact that various sectors of the national economy, with tense relations between them, are pushing each other out. These comrades are asking for the situation to be changed so as to turn the relations between various sectors of the national economy to an unfolded state. We feel that this view does not seem pertinent either. First, the concepts of "extruded" and "unfolded" are not precise enough, since people can define them in a variety of ways. Therefore, such concepts can hardly be precise indicators for judging the rationalization of the economic structure. Second, in conceptualizing the present economic structure of our country as "extruded," they have not managed to grasp the core of the problem. In other words, they did not point out the most fundamental weakness of our country's economic structure, that is, the serious divorcement of productive construction from the people's consumption. Moreover, the practices of pushing each other out to some extent among various sectors of the national economy do not exclude the effect of pushing each other ahead; while the structure of the "unfolded" type does not necessarily enable those sectors to push each other ahead either. Anyway, according to the real circumstances in our country, it is inevitable that tense relations will still remain for a long period of time between some major sectors of the national economy, and between some important links of social reproduction. Just as pointed out by Comrade Chen Yun, "we must take care of economic construction as well as the people's livelihood, there must be an equilibrium between them. It looks as if this kind of equilibrium will still remain basically rather unstable for quite a long period of time." "Our work is to keep this unstable equilibrium from overturning." These words, said in 1956, profoundly revealed a phenomenon of regularity in the economic development of our country. Now, 20 years or more have passed, but the observation of Comrade Chen Yun is still completely applicable. We can neither talk about rationalization irrespective of our national condition, nor totally disfavor the tense relations between economic sectors either. Our very task is to correctly handle these tense relations, keep the necessary balance between them, and give full play to their function in promoting each other.

On the Stages and Periods of Readjustment

In order to properly divide the whole readjustment into stages, and carry out the job step by step with each closely linked to another, we have to comprehensively analyze the problems existing in the present economic structure and the contradictions which we are confronted with.

What contradictions and difficulties do we have in our present economic life? In our opinion, the major ones are: 1. Agriculture and light industry are still backward. 2. Heavy industry is being lopsidedly developed and the internal proportions are unbalanced. 3. There is a shortage of energy as well as of some important raw materials. 4. Communications and transportation do not meet the needs of the development of the national economy. 5. Those sectors such as commerce, service trades and so on are backward. 6. There are contradictions between capital construction and financial and material resources. 7. There is disproportion between "bone" and "flesh." 8. The foreign trade development does not conform with the needs of the development of the national economy. 9. Quite a part of the people still live a difficult life and there are quite a lot of people in the towns awaiting employment. 10. We have had financial deficits in successive years; as we have issued too much currency, the prices of many commodities have gone up.

To deal with the above-mentioned contradictions, which are linked with one another we must find out how they are connected, differentiate the important from the less important and the urgent from the less urgent, and solve them one by one. In our opinion, to solve or basically solve these contradictions, the job can be divided into three stages and will take about 10 years before a comparatively rational economic structure will be initially established.

The first stage is to eliminate deficits and stabilize the economy. The aims of this stage include: to accomplish financial balance; to stabilize commodity prices; by reasonably allocating jobs to people in towns awaiting employment, actively promote the commerce and service trades, improve the relations between the "bone" and the "flesh," and thus further improve the livelihood of the people in the towns and countryside on the basis of the results achieved in the last few years.

Why do we consider eliminating deficits and stabilizing the economy as the central link of the present stage of readjustment? Because this problem being the comprehensive expression of various contradictions in current economic life, reflects the fact that the scale of capital construction has gone beyond the capacity of our country's financial and material resources, that the growth of the people's consumption has surpassed the developing speed of the production of consumer goods, and also that the various sectors of the national economy are so seriously out of proportion that reproduction cannot be carried on smoothly and is resulting in very bad economic effects. On the other hand, it has brought about inflation and the rise of commodity prices, which have affected the people's livelihood. This is the main problem we mean when speaking of the underlying crisis in the present economy. Without solving it, the other tasks economic readjustment will hardly be attainable. That will not only prevent the people's living standard from further improvement but will also counteract, through the rise of commodity prices, the good results already achieved, or even disturb the stability of society.

At this stage, the following measures, such as concentrating on the elimination of financial deficits, making every effort to reduce expenditure and broaden sources of income (in particular, vigorously promoting the production of consumer goods) can accompany and help the gradual solution of a series of other contradictions. We anticipate it will take about 2 years to complete the tasks of this stage.

The second stage: To readjust the proportions of agriculture, light industry and heavy industry. In this stage, emphasis should be placed on the further readjustment of the proportions of agriculture, light industry and heavy industry so as to basically harmonize the proportions of the two major divisions of social production and thus push ahead with the appropriate improvement of the people's livelihood. During this stage, national investment in capital construction will not increase noticeably, and energy production will not rise obviously either, some energy resources will even probably decrease a little bit. But, relying on the basis of the readjustment in the previous stage, and by giving full play to the latent power of the existing enterprises and vigorously economizing on energy resources, we will be able to turn the state of the serious disproportions of agriculture, light industry and heavy industry into a basically harmonious relationship, through various measures of readjustment and reform.

Why should we make the further readjustment of the proportions of agriculture, light industry and heavy industry the central link of the economic readjustment after the balance of revenue and expenditure has been achieved? Because industry and agriculture, being the fundamental material sectors in society, occupy a decisive position in the whole national economy at the present level of development of productivity in our country. They control the direction of economic development, and condition the development of other material production sectors and other social causes. The relations between agriculture, light industry and heavy industry basically embody the relations between the two major divisions of social reproduction, which are the most fundamental proportionate relations affecting the social reproduction process. Meanwhile, the harmonization of the relations between agriculture, light industry and heavy industry is the prerequisite for correctly handling the relations between accumulation and consumption. How large a portion of the national income can actually be used for accumulation and consumption respectively, in the last analysis, is decided by the social production structure consisting of the production of the means of production and the production of the means of subsistence, as well as by the possibility of change of this structure within a certain period. Now the accumulation rate is still too high, and should be lowered further. And the condition for this is to further harmonize the proportions of agriculture, light industry and heavy industry, and to readjust the relations between the production of the means of production and the production of the means of subsistence. In fact, the faults in the economic development strategy in the past were mainly due to the mishandling of the relations between agriculture, light industry and heavy industry. And this is exactly the key issue responsible for the irrationality of the economic structure at present. In the first stage of readjustment, in order to accomplish the balance of revenue and expenditure and the stabilization of the economy, the relations between agriculture, light industry and heavy industry must also undergo readjustment. Nevertheless, as changing the industrial structure takes time, we cannot expect to reverse the series disproportions of agriculture, light industry and heavy industry in the first stage. After the completion of the basic tasks of the first stage, as the conditions for further harmonizing the proportions of agriculture, light industry and heavy industry are available, to deal with these relations should become the most important task of the second stage.

Of course, this in no way implies that tasks in other fields can be neglected. In the past, when placing emphasis on the problem of agriculture, light industry and heavy industry, we have always overlooked the functions of those sections such as commerce, service trades and so on, and neglected the role of scientific education, and even that of those infrastructure and vanguard sectors such as the construction industry, communications and transportation, and so forth. From now on, we should prevent such erroneous practices. In the course of harmonizing the proportionate relations between agriculture, light industry and heavy industry, the collaboration of other sectors is needed. Hence tasks in these sectors have to be strengthened correspondingly. Based on the appraisal of the present economic situation, we may envisage the completion of the tasks of this stage in about 3 years if the jobs are well done.

The third stage: The preliminary rationalization of the economic structure. In this stage, importance should be attached to changing the grave backwardness of the infrastructure, so that the energy industry, communications, posts and telecommunications services, and municipal construction can be developed relatively fast, comparatively harmonious relations can be established between and within agriculture and industry, and between other sectors of the national economy, and economic and social development can be better coordinated. On this basis, we will try to considerably enhance economic effect, enable the national income to achieve a fairly high rate of growth, and the people's livelihood to improve fairly substantially. May we suggest a tentative idea as follows: to raise the growth rate of the people's consumption level in the urban and rural areas to, or near, what it reached in the period of the "first 5-year plan," in other words, around 5 percent per year on average, in the later period of this stage?

In the second stage, the readjustment of the proportions of agriculture, light industry and heavy industry still have to be restricted by many objective conditions. First of all, the energy production will not be noticeably increased; second, communications and transportation will still remain rather weak; moreover, the backwardness of other infrastructure sectors will hardly be changed enormously. Apart from other causes, all these circumstances are closely attributable to the fact that the investment in capital construction is strictly limited. For this reason, while the proportionate relations between agriculture, light industry and heavy industry can only be readjusted to a reasonable extent within the limit of the above-mentioned conditions, quite a few problems will still exist in the economic structure as a whole. On the other hand, as social production and national income will not rise very fast, the growth of the people's revenue and the improvement in their living standard will still be quite limited. Precisely because of this, strengthening the energy industry, communications and transportation, and other infrastructure sectors will become the key problem which urgently needs to be solved to further improve the economic structure after the end of the second stage.

By the way, the basic conditions for this will be at hand by that time, since the proportions of agriculture, light industry and heavy industry will have been basically harmonized in the previous stage, both the development of production and the national financial state will have been substantially improved, and the economic status of enterprises and their operational and administrative level will have been improved and enhanced. Therefore, it will be possible to gradually and reasonably increase the accumulation on the premise that an appropriate growth of the people's consumption will be guaranteed, and to increase the investments in the energy industry, communications and other infrastructure sectors and speed up their development in accordance with our needs and ability. Take the energy industry for example, we have placed emphasis on economization in the first and second stage. Of course we will try our best to increase investment a little, but the amount will be limited after all, and it will take time to produce an effect. Only from the third stage on will we be able to attach due importance to the exploitation of energy while upholding economization. As everybody knows, our country is quite rich in energy resources, if only we can gradually release more funds, and rationally make use of foreign capital which is favorable to us, and do a good job of exploration and exploitation, we can be optimistic about the prospect of solving the energy problem.

Following the strengthening of the energy industry, communications and other technological structures, agriculture, light industry and heavy industry will be further developed under the new conditions, and the relations between them will be further harmonized as well. Starting from this basis, the primary rationalization of the whole structure of the national economy will be completed. Besides, as the relations of production have been gradually modified, the reform of the economic administrative system has been completed step by step, and the economic development of our country has turned to a new path, the development speed of production can be speeded up, the effects of economic activities will be much better than at present, and the growth of the people's consumption level will considerably exceed that in the two previous stages. In our opinion, we should make every effort to accomplish the tasks of the third stage in 5 years. Whether or not this idea is appropriate needs further deliberation.

It should be noted that the above-mentioned three-stage division is relative. These stages are differentiated from each other because of their own priority tasks, yet related to each other because of their common aims. For example, in order to eliminate financial deficits, we have to stress developing agriculture and light industry and readjusting the relations between agriculture, light industry and heavy industry. The promotion of energy production and communications and transportation also cannot only be undertaken in the third stage. It should also be noted that 2 years or more have passed since our plan of readjustment got under way soon after the third plenary session. This should be considered as well in deliberating the matters of the stages of readjustment and the tasks and interval of each stage. After the completion of the tasks of the second stage, we believe, the situation of serious imbalance in the important proportionate relations of the national economy will primarily be overcome, the latent crises completely eliminated, and the readjustment period--the period with readjustment as its key task, which we are concerned with at present--will be terminated. However, the rationalization of the economic structure will still be far from being entirely completed, and should be continued. Nevertheless, the task of readjustment will not necessarily remain the core of economic tasks again, it can be dealt with in combination with other jobs. In fact, during the third stage mentioned above, the reform of the economic administrative system will become more and more important. Besides, even after the completion of the readjustment tasks of the 3rd stage, we will still have to readjust and improve the economic structure from time to time in accordance with the current domestic and international economic situation and with the change of social needs and that of the technical conditions of production.

Concerning the Measures for Each Stage of Readjustment

We have discussed above the tasks of the different stages of readjustment. In order to accomplish these tasks, we are required to deliberate and take various appropriate and concrete measures.

Because the tasks of readjustment concern every domain and field of economic life, and have to be carried on stage by stage over quite a long period, some principles which are to be shown below must be observed in working out the readjustment measures. First, all readjustment measures should embody clear-cut aims in accordance with the major tasks which are designated to be accomplished in each stage. Second, all measures must be synchronized to form a complete chain, so as to coordinate and enhance each other, aiming at solving the central task; mutual exclusion and counteraction must be avoided. Third, all stages must be coordinated. While various measures are divided by stages, continuity still has to be maintained to link them together. Fourth, an important characteristic of the current economic readjustment is that it is being carried out along with the reform of the economic administrative system. Therefore, the relations between readjustment and reform must be correctly dealt with so that they complement and enhance each other. Actually this is nothing other than the correct handling of the relations between the productive forces and the relations of production, and those between the economic base and the superstructure. Fifth, we must pay attention to economic effect in working out various measures. Every measure must undergo accurate calculation and strict proof, with advantages and disadvantages being weighed again and again, so as to achieve the greatest results with the least effort. In the past, one could ignore the costs as well as economic effect in endeavoring to complete a certain task. Such practices are not encouraged anymore.

Now we are going to discuss, stage by stage, some important readjustment measures which should be taken.

(1) Measures to be taken in the stage of economic stabilization.

All readjustment and reform measures in this stage must aim at the completion of the tasks to realize the balance of revenue and economic stabilization. On the other hand, they have to prepare the necessary conditions for the readjustment tasks in the next stage. In brief, the measures to realize the balance of revenue and expenditure are nothing other than reducing expenditure and broadening sources of income. Basically speaking, the most important things are to promote production and increase income. Based on this principle, the principal measures in this stage are as follows.

1. Attach great importance to promoting the production of consumer goods for daily use, while trying our best to ensure good agricultural harvests. We should start from famous brands and center around key cities, to speed up the development of those consumer goods which can produce results in a short period because of the urgent market demand, great return of currency and technological maturity.

The agricultural harvest has been fairly good in the last 2 years, which is the basis for the present good economic situation. However, in a country with a large population and scarce cultivated land like ours, we still have to pay due attention and can by no means lower our guard to the importance and arduousness of agricultural development. The agricultural problem cannot be regarded as solved and will still remain a problem of primary importance to the national economy in the future. The direction of the latest agricultural development to depend on correct policies in the first place and on science in the second has already been proved totally correct by practice. Therefore, we should carry on in this direction. We must have a full evaluation of the fact that the latent power to develop agriculture in various areas is still quite enormous. It would be absolutely possible to achieve steady growth in agriculture if only we could conscientiously uphold all the correct policies set by the central authorities, continuously sum up experience, promote and modify various forms of production responsibility systems in accordance with different places and situations, and promote diversified economy while taking good care of grain production.

To vigorously promote the production of consumer goods for daily use is an important measure in the current drive to improve the people's livelihood, and also a key act for the present readjustment of the economic structure. We should conscientiously carry out the important plan which the State Council has drawn up lately with regard to this problem. To promote the production of consumer goods for daily use can provide more and better industrial products for the market and for export, thus money can be withdrawn from circulation and the state's financial income and foreign exchange earnings can be increased. In particular under the circumstances that the purchasing power of peasants has been greatly raised in quite a lot of areas after good harvests, the increase in the production of consumer goods for daily use will serve as an important condition for stimulating the economic interflow between town and countryside, satisfying the needs of peasants and further spurring the enthusiasm for production. It should be noted that in such a country with an enormous rural population of 800 million like ours, the promotion of light industry, which provides consumer goods for daily use is indeed a measure of vital importance for strengthening the support of industry to agriculture and consolidating the alliance of workers and peasants. We should have a sufficient understanding of this. On the other hand, to promote the production of consumer goods for daily use can spur on the development of heavy industry as well, which will play an important role in improving the present situation of the irrational internal structure of heavy industry. Therefore, to vigorously promote the production of consumer goods for daily use is not only an important measure for overcoming the present financial difficulties and balancing market supply and demand, but also a long-term guideline for the further readjustment of the economic structure in the days to come.

2. In order to produce more consumer goods, the production capacity of all those heavy industrial departments, such as metallurgy, machinery, chemical engineering and so on, which can be more accurately forecasted and more easily shifted to other types of production, must be turned to serving the light industry market. Some of these departments may produce durable consumer goods, directly or in collaboration with other plants. Nevertheless, the most important thing is to provide more and better raw materials, technical equipment and other technical services for the development of production of consumer goods for daily use. We must try our best to boost the production of light industry and that of those heavy industry departments that render service to the light industry market so that their growth can partly compensate for the temporary decrease in heavy industrial production due to the cutting down of capital construction, and hence ensure a fair growth of the whole industrial production and a bigger increase in the national financial income.

3. Strengthen the rational distribution of energy resources as well as strict administration, and push ahead with the technological reform in energy economization step by step. The energy problem is a very important one in the present drive of promoting production and increasing financial income. The guiding principle for solving the energy problem is to attach equal importance to exploitation and economization. In the near future, we should give priority to economization and make every effort to save oil and other energy resources.

4. Vigorously promote the commerce and service trades, actively develop the collective and individual economy in towns and countryside, try hard to increase the production and supply of nonstaple food in towns, boost economy, make things convenient for the people's livelihood and open up all avenues of employment. It should be noted that the capacity to recruit labor power in this way is quite great. A great development can be achieved if only the proper guideline and policies are adopted and all positive elements motivated. This is another important measure to improve the people's livelihood in this stage.

5. The work of cutting down the scale of capital construction must be upheld well. In order to realize the balance of revenue and expenditure as soon as possible, enormously cutting down the investment in capital construction is an absolutely necessary measure. At the end of last year, the central authorities made the decision of once-and-for-all drawing back with regard to this problem in deadly earnest. Therefore, we must be firm and persistent in carrying out this decision. Not only the contemporary investment but also the total scale of the projects under construction have to be cut down. On the other hand, it is necessary to rationally allocate investment funds and try hard to improve investment effect. Apart from the above, at present, we have to conscientiously deal with those problems that arise after the suspension or closing of construction projects and work hard to minimize the loss of the state's property.

6. Reduce administrative outlays and cut down group purchasing power. All business units which survive on revenue must do their utmost to become enterprized [Qi Ye Hua 0120 2814 0553]; all those which cannot be enterprized should adopt the system of taking full financial responsibility.

7. The policy of closing, suspending, merging and shifting must be resolutely and cautiously enforced in the enterprises that are competing with advanced ones for fuel and raw materials, producing inferior goods with great consumption and high cost and suffering from enormous loss. For some others which have to be maintained yet cannot turn loss into profit in the near future, the system of taking full responsibility for losses must be adopted.

8. Carry on the reform of the economic administrative system which is advantageous to readjustment. Consolidate, substantiate and perfect the reform measures of expanding enterprise autonomy. Strengthen the systematic direction and control by the state while activating the economy. Since great importance must be attached to the reorganization and integration of enterprises, we must actively enforce the restructuring of enterprises with concentration being put on the requirement to promote the production of consumer goods for daily use, organize companies and integrated complexes of various forms in accordance with the principle of coordination between specialized departments and economic rationality. We must create conditions to gradually adjust the prices which are really unreasonable, of a small number of means of production, on the premise that commodity prices are kept stable. In the meantime, we should pay enough attention to making use of the taxation lever and other economic levers to condition the economic relations between enterprises and the state, and between enterprises themselves, so as to improve the situation of disparity in suffering and joy, and ensure a stable financial revenue to the state. Put into force the system of employing funds with interest compensated, by levying resources tax, conditioning tax and income tax for all units and individuals who are profiting from sales revenue. Change the present situation whereby the central authorities suffer from financial deficits while local units are benefiting from surplus, by readjusting the base quantities and limits set for full responsibility in central and local units, according to the real circumstances. At last, we must improve the foreign trade price setting system, carry out the system of accounting at different levels for foreign trade and the unity in action in dealing with foreign businessmen, restrict or even prohibit high-loss commodities from being exported, work hard to reduce the loss in foreign trade and make every effort to turn loss into profit.

9. Put rectification in its due position. Do a good job in rectifying the existing enterprises so as to give full play to them. Enterprise rectification should concentrate on improving operational management and raising economic effect. The following tasks must be conscientiously dealt with: (1) Strengthen fundamental jobs such as calculation, original record, statistics, quota setting and so forth. (2) Comprehensively set up and strictly carry out various systems of job responsibility. (3) Comprehensively put into force the economic accounting system. (4) Correctly carry out the principle of distribution according to work, enlarge the area of piece rate wages and modify the bonus system. (5) Strengthen democratic administration.

While rectifying enterprises, we must also rectify financial and economic jobs, enforce financial and economic discipline, and resolutely ban speculation and profiteering and crack down on smuggling activities.

10. Strengthen the training of workers and staff members. Transform in a planned way a number of closed or suspended enterprises into technical secondary schools and technician training schools, enforce a regular rotational training system for staff and workers, try hard to raise their ideological and political consciousness and technical level.

11. Appropriately control the growth of consumption funds according to the feasibility for developing production. Stop reckless issuing of bonuses and [illegible] the practice of price bargaining.

12. Strengthen economic legislation. Establish and amplify executive and supervisory setups.

13. Unfold extensive economic investigations in a planned way. Make a thorough study of the conditions of our state, try to find out the real situation of various trades, enterprises and products, and forecast changes in market demand. Based on comprehensive balance, work out the readjustment and reorganization plans for different trades and regions, the draft and plan for price adjustment, plans concerning the systems of materials, labor, finance, banking and so on, so as to prepare well for the readjustment and reform in the second stage.

(2) The measures to be taken in the stage of harmonizing the proportions of agriculture, light industry and heavy industry.

All measures to be taken in this stage must center around the requirement to change the serious disproportions among agriculture, light industry and heavy industry, and around the full functioning of the latent power of the existing enterprises. On the other hand, they should aim at changing the investment structure and preparing for the readjustment task of the third stage.

1. Continue to vigorously promote agriculture. On the basis of ensuring steady increase in grain production, try harder to boost the diversified economy in rural areas, and hence provide better conditions for developing light industry and improving the people's livelihood, and gradually decrease the quantity of imported grain and agricultural raw materials.

2. Light industry must be developed in a comprehensive way. While raising the production of general consumer goods, boost the production of medium and high grade commodities. Improve the quality of products, increase their types and variety, bring forth a number of new products and push the popularization of electronic products. In order to raise the proportion of industrial raw materials and push ahead with the development of heavy industry by promoting light industry, the light industrial raw materials structure has to undergo a relatively great change. The food industry and fine processing of agricultural raw materials should be vigorously promoted, strive to make the tax gain surplus arisen from developing the industrial production which relies on agricultural raw materials, compensate for or exceed the increased outlay caused by bargaining and price increases due to the purchasing of agricultural products in excess of the quota, and thus stabilize price compensation at the present level.

3. The heavy industry structure must undergo substantial readjustment as conditions allow so that it can conform with the development of agriculture and light industry as much as possible.

The machine building industry must further be oriented toward the production of consumer goods, the technological restructuring of old enterprises, national defense and export trade. Readjusting the orientation of service of the machine building industry is the key link to readjusting the whole industrial structure. On the other hand, it is also an important condition for the steady and stable growth of heavy industrial production in the course of readjustment. In the past, the machine building industry did not get enough jobs to utilize its full production capacity. This situation must be changed in this stage and a fair rate of growth is supposed to be achieved. To reach these aims, (1) according to the new circumstances, actively expand the production of various marketable machines for light industry and agriculture including forestry, animal husbandry, sideline production and fishery, so as to boost light industry and agriculture. (2) Strive to enforce equipment renewal and technological restructuring in old enterprises on the basis of enterprise restructuring. Fully make use of the production capacity of the machine building industry to serve the restructuring of old enterprises and speed up the modernization of the existing enterprises. (3) Actively pursue sales on the international market. Increase the export of electrical products by a big margin so as to change the export structure and raise the foreign exchange revenue. (4) Enforce a protective tariff policy. The importation is strictly prohibited of all mechanical equipment which can be produced and is subject to quality control domestically. The emphasis is to be placed on raising the level of the domestic machine building industry when introducing new technology. All these measures should be adopted consecutively in the first stage and be comprehensively carried out in the second stage in the expectation that obvious results can be achieved.

The chemical industry should concentrate on developing the means of production for agriculture such as highly effective compound fertilizers, highly effective agricultural chemicals with minimal side effects, and so on. In the meantime, we must strive to expand the production of raw materials for light industry and that of basic chemical industrial products, and make the chemical industry a strong backup for developing light industry.

The civil construction industry and building material industry must be greatly developed. Various ways should be adopted to gradually solve the problem of commercialization of urban housing.

The production structure and orientation of service of the metallurgical industry will also have to undergo a corresponding readjustment so that it can provide suitable and good-quality metal materials to agriculture, light industry, the machine building industry, the construction industry and other departments of the national economy.

4. While continuing to strengthen energy control, concentrate on technological restructuring for energy saving. Further take care of the technological restructuring of substituting coal for oil, and spur the drive to eliminate equipment which wastes much energy and to evolve new products. Strive to considerably lower

the per unit energy consumption of various products. These measures form an important condition for maintaining the steady growth of production at this stage.

5. Continue to limit the scale of capital construction. Employ a portion of the investment saved in restructuring the existing enterprises, and the rest in the construction of those weak links such as energy, communications, and so on.

6. Continue to strive to promote commerce, service trades and urban public utilities. Continue to develop the collective and individual economy in towns, try to raise their proportions in the national economy to the level which was reached in the "first 5-year plan" period.

7. Comprehensively enforce enterprise reorganization, systematically group all enterprises which should and could be organized together into companies and integrated bodies of different forms, primarily realize the rationalization of the organizational structure, create conditions for the vigorous enforcement of technological restructuring and for the further reform of the economic management system.

8. With consumer goods prices basically stabilized, take appropriate measures to adjust the prices of the means of production, and primarily change the present situation whereby the price system is extremely unreasonable.

9. Enforce the new planning system step by step, further bring into play economic levers such as pricing, taxation, credit, and so on, under the state's systematic guidance, and let economic legislation function as well.

10. Comprehensively reform the scientific and technological systems, make science and technology play a more active role in boosting economic development.

(3) Measures to be taken in the stage of preliminary rationalization of the economic structure.

1. While developing upper-level industries, vigorously strengthen and improve the construction of the infrastructure sectors such as energy, communications, posts and telecommunications, and so forth, to ensure the smooth and steady growth of the national economy.

2. With the continuous growth of agriculture and light industry guaranteed, enhance the construction of heavy industry, in particular the construction of mines, raw material production, chemical industry and so on, in accordance with the requirement to further promote agriculture and light industry and to let heavy industry develop in an internally harmonious way.

3. Starting from the basis of the steady growth of the national income, we should increase accumulation on the premise that the people's consumption grows normally. On the other hand, we must rationally expand the scale of capital construction and allocation of investment.

4. As the major proportionate relations of the national economy are taking a turn for the better and the state's financial and material resources are on the increase, a big readjustment of the price system can be carried out.

5. On the basis that the price system has been initially rationalized, we can enforce to a greater extent the reform that substitutes the system of taxation and responsibility for one's own profits and losses for that of turning profit over to the state in companies, enterprises and integrated bodies, and enhance the reform of other economic management systems concerned as well, in an effort to primarily accomplish in this stage the major tasks of systems reform.

6. While developing material production, more vigorously combine economic development with social development by employing more funds and material in promoting science, education, cultural activities, public health and other social utilities.

What we have deliberated above is tentative and quite immature. Our major aim is to cast a brick to attract jade in the hope that the studies and discussions on the problems of economic readjustment can be further intensified so that they will help us in our actual work.

--Completed in April 1981.

PRC ECONOMIC JOURNAL ON SOCIALIST ROAD

HK060400 Beijing JINGJI YANJIU in Chinese No 6, 20 Jun 81 pp 38-43

[Article by Zhai Songtian [5049 2646 1131] and Geng Taoke [5105 2711 4430] drafted in April 1981 and revised May 1981: "An Important Theoretical Problem Concerning the Principle of Adhering to the Socialist Road"]

[Text] If we are to adhere to the socialist road, we must have an unshakable faith in socialism. This is of major importance to all revolutionaries. However, this unshakable, clear-cut faith does not come into being just like that, but is based on a deep understanding of the Marxist theory historical dialectics and scientific socialism.

Can there be said to exist in this plot of land called China a crisis as far as our faith in socialism is concerned? Naturally the problem is not as simple as that. Due to the unprecedentedly close attention paid by the 1 billion people to the cause of socialism and the ability of the Chinese communists, the mainstay of the Chinese revolution, to withstand the tests which any stormy sea presents the lofty ideals of socialism and communism remain unshakable. However, within society as a whole, there is also no denying the fact that there are certain people who are experiencing various problems in having faith in socialism. For example, some people have pointed out that, according to the laws governing the development of human society brought to light by Marx, history should advance through the sequence of a primitive society, slave society, feudal society, capitalist society, and communist society. Is not the fact that China became a socialist society directly without having been a capitalist society contrary to the laws governing the development of human society? Others are of the opinion that the development of human society presupposes the development of the productive forces and that the productive forces determine the production relationships. Since China's backward productive forces obviously do not have the objective material base for the realization of socialism, and since they are unsuited to the advanced socialist production relationships, is this not similarly contrary to the laws governing the development of human society? In short, there has arisen in these comrades' minds the following question: Was the establishment of socialism in China premature? Can the difficulties inherent in the early establishment of socialism ultimately be overcome? What sort of future can China expect to have?

How should we in fact handle this problem?

After Marx and Engels, by applying dialectical materialism and historical materialism which they founded had conducted much painstaking research into the vast complexities of human society, they pointed out that the development of human history is, like any other object, subject to its own fixed laws: beginning with primitive society, right through the slave, feudal and capitalist societies, up to the transformation into a communist society, we can discern the general law governing the ascent of man. This law, which was brought to light by the founder of Marxism, not only confirms past historical developments, it will also confirm future historical developments. Undoubtedly, this is an objective law of universal significance.

However, we need delve just slightly deeper into the study of the Marxist laws governing the government of human history to discover that the development process of human society is by no means a simple mechanical movement but a living dialectical development process. If we are to correctly understand and grasp this process, we must gain a clear idea of the difference between the logical sequence reflecting the general law governing the process of history and the concrete historical sequence of the development of certain nations and countries, and also the connection between the two. Looking at the overall picture, the logical sequence of history and the concrete historical sequence agree with one another, because the logical sequence of history is merely the abstraction and condensation of the concrete historical sequence. The logical sequence reflecting the laws governing historical development cannot possibly run counter to the course of history. However, the logical sequence of history is not exactly the same as the concrete historical sequence. The difference between the two lies in the fact that the logical sequence of history has discarded the historical sequence molded by externalism and chance and "is a reflection of the process of history in an abstract, theoretically consistent form."[1]

The whole of human society, when viewed in the light of its historical development process, advances strictly according to a logical sequence. However, as far as the concrete sequence goes, when it comes to speaking of a country, nation or locality, the situation is sometimes not like this at all. As Engels said, "History often advances by leaps and along winding paths."[2] Lenin also clearly pointed out: "The general law governing world historical development not only does not preclude individual development stages from showing their peculiarities within a development form or sequence, but on the contrary, it presupposes them."[3] In the history of the world, as for Rome and Greece, in advancing from a primitive society to a slave society, and then to a feudal society, their development process and the logical sequence of history completely correspond. As for the Spartans and Germanic peoples, together with the Romanians and peoples of certain other countries lying in the valley of the Danube River, their development process and the logical sequence of their history do not correspond. Further, the historical development of each of these nations and countries has different characteristics.

Looking at the situation as a whole, many countries in the world have, in the later stages of primitive communes, experienced agricultural communes, this "last stage of the primary social formation." Because agricultural communes possess the characteristics of both public and private ownership, they have become the bridge linking public-ownership-based primitive society with private-ownership-based class society. Marx pointed out: "Since agricultural communes are the last stage of the primary social formation, they are also the transitional state on the path toward the secondary formation, that is, they mark the transition from a society based on public ownership to a society based on private ownership. It goes without saying that the secondary formation includes a series of societies built upon slavery and serfdom." The ultimate effect of agricultural communes "depends entirely on the historial environment."[4] Obviously, the "historical environment" which Marx speaks of here included many historical conditions. Among these, the first to have a decisive effect is the tendency for the form of the internal land ownership system to change. If the principle of private ownership gains dominance over the principle of public ownership, the free private land ownership system will have replaced the communal collective ownership system, paving the way for the development of a slave society, which was the case with Greece and Rome. If the free private land ownership system has not yet come into being, or the conditions for its smooth development are not present, but due to military conquest by other nations, the conquered people and their land are treated as the public property of the conqueror's communes, this will lead to the establishment of a serf society, which was the case with the Spartan and Germanic peoples.

There are some countries in Europe which, with agricultural communes as their base, naturally established dictatorial state regimes and then became feudal serf societies directly. This was the case with the many duchies on the river Danube. "There, the original mode of production was built upon the basis of the communal ownership system, but this communal ownership system was not the same as the Slavic version and was also completely different from the Indian version. One section of land was a free private field, cultivated by the respective commune members, while another section of land was a public field, cultivated by the commune members communally. ...In due course, prominent military and religious leaders seized the communes' landed estates, thus also seizing the labor expended on the public fields. The labor expended by the free peasants on the public fields had become corvee labor carried out for the pirates of the public fields. Thus the relationships of serfdom were developed in its wake."[5]

Although the concrete form in which these nations and countries were directly transformed from primitive societies into feudal societies without ever having been slave societies varied. All these examples occurred during the same historical period, namely the period when the ancient slave civilizations in the whole world were declining and the production relationships of feudal serfdom had already developed. From this we can see that all changes in the social form of a nation or country are closely linked to characteristics of the period in which they occur. The tendency for the social form (here the social form refers to the mode of production which has attained a ruling position, not overlooking the factor that in these countries and nations, other social production relationships existed) to leapfrog in some areas is also attributable to this.

Is this tendency for human societies to leapfrog reasonable? It definitely is, because this leapfrogging has still not transgressed the common path of human historical development. It seems at first glance to be a contradiction in terms to acknowledge both the truth of the logical sequence of history and the peculiarity shown by history at individual stages in its development. In fact it is not. Facts have shown that only by acknowledging the reasonableness of the fact that individual stages of historical development will show peculiarities in the form and sequence of their development can we be said to be historical materialists in outlook.

Historical materialism also asserts that each social form, by changing from a low to a high level and from a simple to a complicated form, is advancing in accordance with the law that the production relationships must be suited to the nature of the productive forces. Marxism once summed up social relationships as being production relationships and production relationships as being the level of the productive forces. It further illustrated with reliable evidence that "any change in the social system and any reform carried out in the ownership relationships are the necessary consequences of the development of the new productive forces which are no longer suited to the relationships of the ownership system."[6] Therefore, when discussing problems concerning the relationship between the laws governing the development of human society and Chinese socialist society, regardless of whether problems are being raised from the point of view of the logical sequence of the development of human society or of the productive forces, we are essentially raising and expounding from different angles one and the same problem, namely that of whether the establishment of socialism in China has violated a basic principle of Marxism.

That the productive forces determine production relationships is indisputable. The productive forces have always been the driving force, behind social development and progress, and the criterion for measuring the development level of the productive forces has been the means of labor. Marx pointed out: "The difference between the various economic eras does not lie in what they produced, but in how they produced it and what means of labor they used to produce it. The means of labor are not only the instruments for measuring the development of the human labor force but also the indicator of the social relationships which labor relies on for its operations."[7] Whatever the means of labor the appropriate production relationships will necessarily come in being.

However, this correlation between the productive forces and the production relationships has a particular form of manifestation under particular historical conditions. The movement of contradictions between them is not a mechanical movement which simply matches up one thing with another. Taking as an example the rise of the capitalist production relationships, the first capitalist revolution in the world successfully took place in England in 1640. However, the tools of production were at the time exactly the same as the tools used in feudal societies. The main ones were still hand tools. Marx said: More workers worked at the same time and in the same space (or we can say at the same place of work) in order to produce the same type of commodity under the auspices of the same capitalists. Both historically and logically speaking, this is the starting point for capitalist production. As far as the mode of production itself is concerned, as for example in the early workshop handicraft trade, apart from the fact that there were more workers employed at the same time with the same capital, there was practically no difference between this and the handicraft trade under the guilds."[8] Steam engines, an important symbol of the industrial revolution, were invented by Watt in 1769 (simple movement) and in 1772 (complex movement). This advanced production tool still had to wait some time before it was used in industrial production. It was not until the late 18th century that it came to be widely used in the textile industry and the chemical, excavation, metallurgical, machine building and other such sectors. It was also not until this period that it laid a material technological base for the capitalist system, enabling the capitalist system to finally triumph over the feudal system and thus attain the ruling position.

From the time the capitalist production relationships attained the ruling position in England to the time a suitable major industrial material base was set up, there was a time lag of about one-and-a-half centuries. This proves that in establishing a suitable material base, it is not unusual for a new social system to require a historical process. Due to differing concrete situations among the various countries, this process requires differing lengths of time. We can see that it is quite normal for our country to require a historical process to establish a material base suited to the socialist system.

We can further see from the history of the birth and development of capitalism in England that the tools of production do indeed ultimately determine production relationships. However, the tools of production are not the only factor to have a decisive effect on the productive forces. Why was it that in the early period after the birth of capitalism in England, when there was no marked change in the tools of production and feudal society, the social productive forces underwent an important change? This was because the capitalist workshop handicraft trade revolutionized the mode of labor of the individual, and coopertion itself gave rise to new productive forces. This transformation of the social production relationships brought about by the productive forces created by cooperation itself was still in accordance with the law that production relationships must be suited to the nature of the productive forces. It in no way violated this objective law. Was it for this reason that some people complained that capitalism should not have emerged in England so soon? Apart from the toppled class of feudal lords, there was probably no one else around making this complaint.

The birth of the socialist society in our country took place in accordance with the objective laws governing human historical development and came about under the effect of the basic law that the production relationships must be suited to the nature of the productive forces. We know that even though the level of economic development in our country is low because of the fetters of long feudal rule, from the time Western technology was introduced in the Qing Dynasty up until the eve of liberation, large-machinery production was already in existence in China and was developing over this period of about 90 years. Modern industries already accounted for 17 percent of the total output value of industry and agriculture in the whole country, and industrial workers numbered over 3 million. The development process of large-machinery production in China was different from that of countries overseas. It had its roots in the military industries operated by officials of the Qing government. Not until afterwards did we have the heavy and light industries operated by businesses under the supervision of officials and also those operated jointly by businessmen and officials. Only eventually did we see the development of private capitalist industries consisting mainly of light industries and did they reach a fixed standard. For example, all soda-making industries set up by certain patriotic national capitalists, regardless of their production, equipment, management or technological level, had by the 1840's reached advanced levels compared with identical products on the international scene at the time.

Another characteristic of large-machinery production in China was that it was concentrated in the hands of the imperialist class and the bureaucratic comprador bourgeoisie. They monopolized the economic lifelines of China. These reactionary and backward production relationships severely hindered the development of the productive forces. There was an urgent need to destroy these degenerate production relationships if the productive forces were to be developed. According to a basic Marxist point of view, both human and material factors are included within the productive forces, and only a social system which makes full and reasonable use of both human and material resources in the production process can be called an advanced social system. Man was the most active of the social productive forces in China at the time. Regardless of whether he was one of the less common industrial workers, a proletarian or semi-proletarian from the vast countryside, or one of the other laborers, he was subjected to enslavement and oppression of a kind that far exceeded that to which European and American laborers were subjected. History had already reached the state where the ruling class of the day definitely could not continue to rule and the ruled class definitely could not continue to live. The social productive forces were in a state of atrophy and were in desperate need of liberation. These forces became an enormous driving force in the transformation of the then degenerate and declining production relationships. Social mention must be made of the fact that poor peasants and farm laborers accounted for 70 percent of the rural population of China. Under the leadership of the Chinese Communist Party and having been tempered in the protracted revolutionary struggle, they soon became reliable allies of the proletariat and the main force in the revolutionary ranks of China. They looked forward to the birth of an independent, democratic, free, happy and strong new society. Under these circumstances, the worker movement were united quite naturally and forged into one body. This became an evident characteristic of the Chinese revolutionary movement. Therefore, proceeding from the realities of Chinese society, in 1949, when the new democratic revolution was victorious, we already had the necessary economic and political preconditions for embarking upon the socialist path. To be sure, our material base was not completely suited to the demands of a mature socialism, but this unsuitability, when compared with the situation in England in the early period of the bourgeois revolution, showed a much higher degree of "suitability." If this was the case even in the capitalist revolution then the proletarian revolution, the greatest in human society, should not abandon its own historical mission either. Of course, it should vigorously propel society forward. As Lenin pointed out when speaking of the October revolution: "If we say that since we acknowledge the fact that our economic 'strength' is not suited to our political strength and we should 'therefore' not seize political power, then we have made a cross error. So-called 'blinkered men' reason in this fashion. They have forgotten that there will never be such a thing as 'suitability' whether we are talking about developments in the natural world or about developments in society. This kind of adaptation can never come about. Only after numerous attempts--of which every individual attempt will be one-sided and suffer from certain errors of maladjustment--can a perfect socialism be established with the cooperation of the proletarian revolutions in the various countries of the world."[9]

In our investigation into why China should bypass the capitalist stage and embark upon the socialist road from a semifeudal, semicolonial society, we cannot depart from China's specific historical conditions and the overall international scene at the time. Ever since China got rid of slavery and became a feudal society, its economy, politics and culture have for a long time developed at a snail's pace. Of course, we should be certain in our minds that, regardless of how lengthy the duration of the process of feudal society, China would sooner or later have entered the phase of a capitalist society. As Comrade Mao Zedong pointed out in his analysis of the nature of Chinese society: "The development within Chinese feudal society of a commodity economy already carried within itself the seeds of capitalism. If it had not been for the influence of foreign capitalism, China would also have gradually developed into a capitalist society."[10] However, with the outbreak of the opium wars in 1840 and the invasion by Britain, France and other such imperialist countries, the possibility of China gradually entering the phase of a capitalist society was dashed. "The purpose of the imperialist powers' invasion of China was definitely not to change feudal China into a capitalist China. The purpose of the imperialist powers was the opposite of this. They wanted to transform China into a semicolony or colony."[11] After we achieved the victory of the new revolution on the semifeudal, semicolonial base, in the light of developments in the world, capitalism had long entered the imperialist era. At that time, any oppressed nation or country that wanted to establish an independent capitalist society would meet with obstruction and suppression from imperialism. There was really no way of shaking off the position of a country enslaved and oppressed by imperialism. It can be said that the international conditions prevalent at the time had already blocked the path for China to enter the phase of capitalism. At the same time, because the big bourgeoisie among China's bourgeoisie had long been embraced by imperialism and become the allies of the landlord class, they became accomplices in colonialism and the mainstay of feudal rule. Further, due to the weakness and compromising nature of the national bourgeoisie, they could not assume the task of leading to the end an anti-imperialist, antifeudal bourgeois democratic revolution. Although leading figures among them like Kang Youwei and Yan Fu had made indefatigable efforts in their quest for truths from the West to save their country and to embark upon the path towards capitalism, as it turned out, this was nothing more than wishful thinking. As for the revolution of 1911 led by the pioneer of the great bourgeois democratic revolution, Dr Sun Yat-sen, although it did overthrow the monarchy, and establish the Republic of China, it failed to change the semifeudal, semicolonial social nature of China. Both the actual economic and political situations in China and the characteristics of the historical period of the world at that time determined the fact that China could not enter the phase of a society where capitalist production relationships reigned supreme and that China had to bypass this stage on its way toward the bright road of socialism. This is the inevitable consequence of our historical development and the only option open to the 1 billion Chinese people. But up to this day, some people are still thinking of establishing capitalism in China and some cannot comprehend this historical choice. It can be seen that they understand neither the history of China nor its situation and even less the characteristics of the era. This shows extreme childishness on their part.

There is no doubt that we must also realize that this leapfrogging and this backwardness of the productive forces in the historical development of society has brought about a peculiarity in the future consolidation and development of our society. Particularly in the case of a country like ours which proceeded directly to the stage of a socialist society from a semifeudal, semicolonial society, there must be many characteristics during the process of developing socialism that are peculiar to us, the most prominent of which is the arduousness involved in building socialism. After the victory of the October revolution, Lenin, with Russia's backwardness in mind, pointed out: "Compared with the various advanced countries, it was easier for the Russian people to start the great proletarian revolution, but to carry it through to the final victory, that is, to complete the construction of a socialist society, is rather more difficult."[12] Old China was much more backward than imperialist Russia. Our task of building a socliast society is obviously more difficult and arduous than that of the Soviet Union. In particular, the backwardness of scientific and cultural education, the fetters of the long period of feudalism and natural economic thinking, the entrenched bad practices of small-scale production and the influence of force of habit have brought with them even more severe obstacles to economic development. However, due to our rather long exposure to "leftist" thought, our inability to clearly recognize the peculiarities involved in the development of socialism in our country, our failure to adequately estimate the arduousness involved in the building of a socialist society, our rushing to effect completion, and the illusion that socialist revolution and construction could be carried out in a day, the end result has been "more haste, less speed." In the first 2 years after the smashing of the "gang of four," due to our inadequate knowledge of the harm caused by "leftist" thought, some unrealistic slogans were once again put forward. When we had been liberated from the fetters of "leftist" thought, some people, on seeing that a long, hard period still lay ahead if we were to completely realize the ideals of socialism and communism, were entirely at a loss as to what to look for in life. Some individuals even became victims of self-neglect as their sacred and glorious ideals were shaken. In order to arouse people's ardor, in addition to devoting major efforts to propagating the fact that the Chinese socialist system is entirely in keeping with objective laws, we should seek truth from facts and propagate the arduousness involved in building socialism, so that our comrades will at the same time be brimming with confidence and be down to earth in their approach as they tackle the difficulties that lie ahead on the path to progress.

Although the theory of scientific socialism was founded by Marx and Engels over 130 years ago and over 60 years have elapsed since this theory was put into practice, in the endless flow of human history, when all is said and done, this is only a batting of an eyelid. It is still in the stage of continuous development and perfection. Engels said: "Since socialism became a science, it has demanded that people treat it as such. That is to say, it has demanded that people study it."[13] Therefore, the theory of scientific socialism must never be treated as a dogma. Whether or not we have adhered to the socialist road is definitely not a matter of whether or not we have rigidly stuck to the writings and individual conclusions of the founders of Marxism, but more a matter of whether or not we have remained faithful to the essential spirit of scientific socialism. In particular, we must see whether the universal truths revealed by them can be integrated with concrete practice in China and whether the series of questions on the socialism brought about within the specific economic environment of and under the specific historical conditions in China can be answered. Comrade Mao Zedong once warned us that, when analyzing contradictions, it is hardly adequate to merely understand their universality. "Of special importance is that fact that we must pay attention to their particular characteristics, and this forms the basis of our recognition of things."[14]

Only an investigation which pays attention to the peculiarities of socialism in China and a reply which seeks to convince people by applying the basic principles of Marxism and Mao Zedong thought to its particular characteristics can encourage and impel the popular masses to struggle on indefatigably. This is an extremely glorious military-like task for the theorist.

Comrade Deng Xiaoping once said in a speech he made at the beginning of the 1980's that we are still quite definitely lacking in experience in how to practice socialism, and that it is only now that we have conscientiously found a relatively better path. Since the 3d plenary session of the 11th Central Committee, we have already done much work in this respect. As long as we continue to adopt a scientific attitude in our study of and research into Marxist truths, remain faithful to the essential spirit of scientific socialism, thoroughly eradicate the influence of leftist thought while at the same time paying attention to the prevention of disturbances from the right, we will definitely be able to progress in a socialist direction. A highly democratic, highly civilized, powerful, modern socialist country will definitely emerge in the Eastern world.

BUILDING OF NEW RURAL ENERGY SOURCES DISCUSSED

Use of Methane Gas, Solar Energy

Beijing BEIJING RIBAO in Chinese 10 Jul 81 p 1

[Article by Ren Zhixi [0117 4460 3679]]

[Text] "To light a lamp without using oil; to cook without worry; to bathe without leaving home; and to see a play without leaving one's kang." This is a scene from the life of commune members in the Liuminying Production Brigade of Changziying Commune in Daxing Commune. Since last year this production brigade has vigorously developed new energy sources, and virtually every household has built a methane pit and a solar energy bath. In a village of 162 households, there are 155 methane pits, and 152 solar energy baths.

Last year this production brigade's per unit grain yields reached 1,400 jin per mu and annual income amounted to 720,000 yuan, each person averaging 2,670 jin of grain. Production and living standards rose, but because of the increase in the rice growing area, there were no stalks and stems to be used for fuel. Every family depended on the hauling of sawdust and not fully burned coal ashes to cook their food and provide heat. A family of five would spend an average of somewhat more than 70 yuan per year in a situation that was truly one of "no worry about what to put into the wok, but worry about what to put under the wok." Last year, the brigade's party branch summarized the lessons of experience in failure from the building of methane pits, and both sent people to advanced brigades to study techniques and used classical methods of leading the way, first building a methane pit connected to the three toilets and pig pens of three production team cadres. As a result, each family used only three matches a day to prepare three meals, saving expenses, saving time, and having sanitation. During electric power outages, they could light lamps. Next, more than 100 households in the village asked for construction of methane pits. The brigade's party branch had the brigade supply bricks and cement, the individual commune members themselves providing labor in arousal of the masses to build methane pits. As a result, by this spring the entire brigade has been methanized. Last spring's use of the first 36 methane pits to be built has shown that by using methane gas for cooking, it is possible to prepare three meals a day 6 months of the year, two meals 2 months of the year, and one meal 4 months of the year. The masses no longer "worry about what to put under the wok." The waste from the methane pits makes fine fertilizer. Used to fertilize wheat and rice, it causes resistance to lodging, resistance to disease, and filling out of the grain. Last year they used methane pit waste to water cabbage with phenomenal results.

Formerly when a commune member wanted to take a bath, he would have to travel at least 15 li and as far as 50 li, missing work and wasting money. It was a nuisance as well, so some commune members never took a bath. In 1977, the production brigade built a public bath, which was open twice a month and which consumed 400 jin of coal each month, but commune members still felt it was inconvenient to use. Last year the County Science Committee developed a solar energy box-type hot water device of simple construction that could be used in a family solar energy bath. The County Science Committee set up a pilot project in the Liuminying Production Brigade, which the production team's party branch enthusiastically supported. Party branch secretary, Zhang Zhanlin [1728 0594 2551] took the lead in building a solar energy bathroom in his home, where results of experiments showed that water reached a maximum temperature of about 65°C and remained at about 40°C at 11 o'clock at night, so that a family returning home from work could take a bath, sometimes bathing twice a day. Commune members were happy as soon as they saw it and clamored to have solar energy bathrooms built. Under the organization of the brigade's party branch, the brigade provided materials, bricks and mortar, and the commune members themselves did the work, very quickly constructing solar energy bathrooms in 152 commune member households. During 6 months of the year, commune members can now "take a bath without leaving home."

As a result of the popularization of methane pits and solar energy bathrooms, individual health throughout the brigade is good; environmental sanitation is good; people can relax in their free time; and expenditures have been economized as well. Everyone has learned from experience about the superiority of the collective economy, realize the tremendous power of science and technology, and have greater zeal for work on the four modernizations.

'BEIJING RIBAO' Comment

Beijing BEIJING RIBAO in Chinese 10 Jul 81 p 1

[Text] The very good experiences of Liuminying Production Brigade in using methane gas and solar energy marks the direction of development for use of new energy resources by suburban rural villages.

For the past several years, new growth has occurred in endeavors by suburban rural villages to use new energy sources, and many production brigades now use methane gas to cook and for illumination, and methane is even used to generate electricity. In Daxing County, numerous communes, brigades, and units have built solar powered baths, and some also use solar energy to propagate seedlings, to grow vegetables, and to dry grain, opening new paths for multiple uses of solar energy. Additionally, some production brigades and units have begun to use geothermal energy in building baths, and using windpower to generate electricity. These facts demonstrate that the field is vast for tapping new energy sources, and use of new energy sources holds vast prospects. Nevertheless, use of new energy sources in suburban rural villages is very unbalanced. In some places, because leadership cadres have given insufficient serious attention, no action has yet been taken.

In some other places, because of a lack of technology and management measures, projects have been abandoned in mid-course. Some people even think that to make methane is to work "in vain," and that it is "spending money to go looking for trouble." They do not believe in science, supposing that "there are no lamps that save oil and no stoves that save on firewood, methane gas and solar energy not being able to solve any large problems."

For this reason, vigorous pursuit of methane gas and solar energy endeavors will require strengthening of leadership and straightening out of perceptions so that people realize that the tapping of new energy sources is to use science and technology to effect a transformation in the living habits of several thousand years in rural villages. It both saves energy for the state and is a powerful measure for hastening the pace of the four modernizations, and is a major way, as well, to develop agricultural production and improve the life of the masses for the benefit of the state, the collective, and individuals. Everyone should be concerned and should make efforts. In order to do a good job in this undertaking, it is also necessary to take effective action to arouse the masses. In this regard, Liuminying Production Brigade provides very good experiences. First they learned to do what they had been unable to do, learning from experts and advanced units to get a grasp of the technology. Second they used classic methods of leading the way so that everyone could see results with his own eyes to make the masses more receptive. We hope that communes and brigades everywhere will study the fine experiences of Liuminying Production Brigade, and study their scientific attitude and methods so that there will be more new energy villages in the suburbs, and that standards will rise somewhat so that development of methane gas and solar energy undertakings will flourish more, the better to create prosperity for the people.

Sichuan's Small Methane Power Stations

Beijing RENMIN RIBAO in Chinese 12 Jul 81 p 1

> [Text] Xinhuashe Editor's Note: As production develops and the standard of living of the peasants rises, rural villages will need more and more electricity, but at the moment, the rural villages of the country are very short on electricity. Therefore, in places where raw materials for fermentation are sufficient, the building of small methane gas electric power generating stations is one way for rural villages to tap a new source of electric power for which the prospects are extraordinarily vast. At the present time, numerous rural villages in Sichuan Province are in the process of constructing small methane gas electric power stations and are urgently in need of large amounts of methane gas power generating equipment. Are not some of our machine industry units shouting that they "have nothing to eat"? If they can open a road to supply these rural villages with methane gas power generating equipment, they will find a great market for it. They will find rice to put into their pots and have something to eat.

Rural villages in Sichuan Province have blazed a new trail in the use of methane gas to generate electric power by building small methane gas electric power generating stations. As of the end of last year, 488 small methane gas electric power generating stations with an installed capacity totaling 2,629 kilowatts had been built throughout the province.

Rural villages in Sichuan generally lack electricity. During the past several years, less than 10 percent of all production teams had electric power. Since 1974 numerous communes and production brigades in rural villages have scurried to make methane gas, providing an inexpensive fuel for the generation of electricity. Then, small methane gas electric power generating stations sprang up. Most of these small methane gas electric power generating stations use a mixture of methane gas and diesel oil as fuel, but some use methane gas exclusively as fuel.

Small methane gas electric power generating stations have tapped new electric power sources for rural villages, have promoted industrial and sideline industry production, and have improved the livelihood of the people. Last year No 1 Production Team of Guangrong Production Brigade in Chengdu's southern suburbs built a small methane gas electric power generating station. In addition to providing enough electricity for the production team itself, it supplied power to two nearby production teams, saving 12,960 kilowatt hours of electric power annually for the state. Shimiao Commune in Ba County, located at 1,060 meters above sea level in the high mountains, has no water power resources, and construction of high voltage power lines is also difficult there. During the past 2 years, individual production teams have built 13 small methane gas electric power generating stations with an installed capacity of 170 kilowatts. Last year, this commune generated a total of 10,500 kilowatt hours of electricity, and 40 percent of peasant households have electric lights.

The experiences in Sichuan Province demonstrate that rural village use of low cost, easily developed methane gas energy for the building of small, scattered methane gas electric power generating stations that the masses can operate possesses advantages in short electric power lines, small loss of power in transmission, quick results, savings in petroleum resources, and small investment, with great acceptance by the peasants. Right now, enthusiasm is running high in rural communes and brigades for the operation of small methane gas electric power generating stations, and many are pooling their funds to accelerate construction. Numerous prefectures have formulated development plans. In many distilleries, livestock farms, and truck farms that have copious raw materials for fermentation to make natural gas, the zeal for operating small methane gas electric power generating plants is greater.

In the construction of small methane gas electric power generating plants in rural Sizhuan, some problems still exist in equipping electric power generating facilities, which research and production units concerned are actively studying for early solutions in a determined effort to provide rural villages, with all possible speed, complete electric power generating facilities of fine quality that can be operated economically and are completely fueled by methane gas to meet the needs of rural villages.

USES OF SOLAR ENERGY, BIOGAS DISCUSSED

Development in Beijing Suburbs

Beijing GUANGMING RIBAO in Chinese 21 Jul 81 p 2

> [Text] Editor's Note: In recent years, some places and units have acted in accordance with realities, adapting general methods to specific situations to make a start in research and application of solar energy, achieving remarkable results. However, other individual places and units have persisted in seeking the highest, the most perfect, and the best in solar energy research, frequently only to have to quit in mid course in the face of restrictive conditions. The series of manuscripts published here show that inasmuch as China is still in the stage of research and experimentation on new energy sources, in the development and application of solar energy emphasis must go to selection of those projects for which costs are low, results rapid, the technology simple and readily workable, and in which current production and livelihood are intimately related. Only such results of scientific research will be accepted by the masses.

The correspondents arrived in Daxing County, a southern suburb of the capital, in mid-summer. Upon arrival at the county seat, we were attracted at once to the different kinds of solar energy hot water devices that various units and households had installed in their courtyards. Some of these hot water devices were of a stationery panel type, while others were automatically tracking; some were large, and some were small. The largest had a light collecting area amounting to more than 150 square maters; the smallest was only 1 meter square. They were set facing the scorching sun, and their reflection was blinding.

The County Science Committee deputy director Zhang Qingxing [1728 1987 5281], and engineer Xie Guoguang [6200 0948 0342] warmly and excitedly briefed us. Daxing County's experimentation and promotion of multiple applications of solar energy technology began in 1976, developing within the short space of several years from the county seat to the rural villages, and from experimental use of a boxlike solar stove for cooking to the use of solar energy to treat illnesses, to dry grain, to kill insects, and most particularly, use of solar energy to heat water for baths has been most widespread. Now, the multiple use of solar energy has not only blossomed in the city, but numerous communes and brigades in rural areas have also planted the seeds. The collection area for solar energy hot water devices in the county runs to 6,700 square meters, of which more than 600 are home hot water devices with individual light collecting areas of from 1 to 2 square meters. Between May and October of each year, solar energy hot water baths are taken an average of 15,000 times daily throughout the county. In this way, the county saves more than 12 tons of coal daily.

Promotion of a comprehensive technology for use of solar energy in Daxing County has not been all smooth sailing by any means. At the beginning, many people considered it like lighting a candle for a blind person--a sheer waste. They said, "If this technology is not popular in Beijing Municipality, how will the rustic cadres and the rubes in the countryside be able to put it to use?" However, the leaders and scientists and technicians of the County Science Committee were undaunted. They patiently propagandized the leaders concerned and the masses, helping one unit after another to design and install facilities for the use of solar energy, using facts to explain their superiority. Up until 1977, there were only two 4 square meter bath houses for the more than 300 workers in the county transportation company, and since the boilers consumed much coal that was difficult to come by, these baths could open only once or twice each week. Each time they opened, only half the employees could take a bath, and they had to queue up to do it. Each day after finishing their shifts, the sweat-covered and grimy drivers, mechanics, and loading and unloading workers had no choice but to splash a little water over their bodies in the dormitory. The summer of 1977, comrades from the County Science Committee helped this company construct a light collecting area of 80 square meters, and an 8 ton solar energy hot water device using sunshine to heat water. Thereafter, from spring to fall every year, not only could all the employees and families of employees in the company take a hot bath daily, but they also annually saved more than 100 tons of coal. The comrades of the County Science Committee also helped more than 50 farm machine plant, nitrogenous fertilizer plant, and manure depository units build installations to make use of solar energy.

Having paved the way in the county seat, the confidence of comrades from the County Science Committee about experimental spread of multiple use technology for solar energy increased. They made up their minds to promote it in rural communes and brigades, letting solar energy warm thousands upon thousands of households. Following numerous inquiries of commune members and repeated experiments, they designed and fabricated a home use solar energy hot water device with a light collecting area of only 1 square meter, and they selected the Liuminying Production Brigade in Changziying Commune to be the test site.

"As soon as test site work got underway, we ran into difficulties," said Zhang Qingxing, telling us the following story. When the County Science Committee notified the Liuminying Production Brigade to haul away the first group of family hot water devices, the cadres and masses in the production brigade were happy. The following day, the secretary of the party branch committee personally went to the county seat early in the morning to accept the goods. However, when he saw that the so-called family solar hot water device was only a metal box 1 meter square, he could not believe that it would be able to satisfy a family's needs for hot water for bathing. He felt so disappointed that he even refused a cup of tea and wanted to return to his brigade with an empty vehicle. Laughingly, Zhang Qingxing restrained him saying, "Let's make a gentleman's agreement. Just you haul these few score hot water devices back to the brigade, and I'll send someone over right away to install one of them before noon. If you are unable to take a hot bath by 3 o'clock this afternoon, I'll haul the hot water devices back and pay you for all your losses." When the commune members finished work at noon that day, they all surrounded the hot water devices, but no one asked for any of them. At 3 o'clock in the afternoon, they crowded into the secretary's house to see just what would happen. When the faucet was opened, a touch showed them that the water was scalding. Then the several score hot water devices that no one had wanted, were all taken.
